Microsemi makes no warranty, representation, or guarantee regarding the information contained herein or the suitability of its products and services for any particular purpose, nor does Microsemi assume any liability whatsoever arising out of the application or use of any product or circuit. The products sold hereunder and any other products sold by Microsemi have been subject to limited testing and should not be used in conjunction with mission-critical equipment or applications. Any performance specifications are believed to be reliable but are not verified, and Buyer must conduct and complete all performance and other testing of the products, alone and together with, or installed in, any end-products. Buyer shall not rely on any data and performance specifications or parameters provided by Microsemi. It is the Buyer's responsibility to independently determine suitability of any products and to test and verify the same. The information provided by Microsemi hereunder is provided "as is, where is" and with all faults, and the entire risk associated with such information is entirely with the Buyer. Microsemi does not grant, explicitly or implicitly, to any party any patent rights, licenses, or any other IP rights, whether with regard to such information itself or anything described by such information. Information provided in this document is proprietary to Microsemi, and Microsemi reserves the right to make any changes to the information in this document or to any products and services at any time without notice.

About Microsemi

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, California, and has approximately 4,800 employees globally. Learn more at www.microsemi.com.

1 Revision History

The revision history describes the changes that were implemented in the document. The changes are listed by revision, starting with the most current publication.

1.1 Revision 6.0

Revision 6.0 of this document was updated in October 2018. The following was the summary of changes:

- Added the A3P600 device name and its associated details across this document. For more information, see [Table 1](#), page 12, [Table 2](#), page 13, [Table 3](#), page 13, [Table 4](#), page 14, and [Table 232](#), page 159.
- Added the High-Temperature Data Retention (HTR) figure. For more information, see [Figure 5](#), page 16.

1.2 Revision 5.0

Revision 5.0 of this document was published in September 2014. The following was a summary of the changes:

- Updated FG896 package in the [Table 2](#), page 13 (SAR34171).
- Removed reference to JTAG interface operated at 3.3 V from "Advanced Architecture" section (SAR 34686).
- Fixed table note (1) in [Table 6](#), page 15 (SAR 47815).
- Deleted ambient temp row and modified notes in [Table 7](#), page 15 (SAR 59413).
- Removed "5 V-tolerant input buffer and push-pull output buffer" from "2.5 V LVCMOS" section" (SAR 24916).
- Removed table notes referencing +/-5% and 350mV differential voltage from [Table 166](#), page 98 (SAR34810).
- DDR frequency added to [Table 188](#), page 113, [Table 189](#), page 113, [Table 190](#), page 114, [Table 192](#), page 116, [Table 193](#), page 116, [Table 191](#), page 115 (SAR 56034).
- Table note (3) added to [Table 207](#), page 127 and [Table 208](#), page 128 to clarify delay increments (SAR 34821).
- Terminology clarified in [Table 209](#), page 133, [Table 210](#), page 134, [Table 211](#), page 134, [Table 212](#), page 135, [Table 213](#), page 136, [Table 214](#), page 136, [Table 215](#), page 140, [Table 216](#), page 141, [Table 217](#), page 142, [Table 218](#), page 142, [Table 219](#), page 143, [Table 220](#), page 144, [Table 221](#), page 144, [Table 222](#), page 145, [Figure 49](#), page 131, [Figure 49](#), page 131, [Figure 50](#), page 131, [Figure 51](#), page 132, [Figure 52](#), page 132 and [Table 53](#), page 52 (SAR38237).
- Revised statement in [VMVx I/O Supply Voltage \(quiet\)](#), page 149 per (SAR 38324).
- Libero IDE revised to SoC throughout (SAR40287).

1.3 Revision 4.0

Revision 4.0 of this document was published in April 2014. The following was a summary of the changes:

- Added FG256 under A3P1000 in [Table 3](#), page 13, in [I/Os Per Package](#), page 13, [Temperature Grade Offerings](#), page 14, "FG256" section, and [Table 10](#), page 20 (SAR 56384). Added Note for Speed Grade in [Ordering Information](#), page 192. Also added missing details for FG484 for A3P1000 to [Table 10](#), page 20 (SAR 56384).
- Added details related to Speed Grade 2 to the [Ordering Information](#), page 192 and the [Speed Grade and Temperature Grade Matrix](#), page 14 (SAR 56384).
- Changed Actel references to Microsemi.

1.4 Revision 3.0

Revision 3.0 of this document was published in September 2012. The following was a summary of the changes:

- The [Security](#), page 5 section was modified to clarify that Microsemi does not support read-back of programmed data.

1.5 Revision 2.0

Revision 2.0 of this document was published in June 2012. The following was a summary of the changes:

- The FG484 package was added for A3P1000 in [Table 1](#), page 12, the [Table 2](#), page 13 table, and the "Temperature Grade Offerings" table (SAR 39010).
- The [FG484](#), page 168 pin table for A3P1000 has been added (SAR 39010).

1.6 Revision 1.0

Revision 1.0 of this document was published in June 2011. The following was a summary of the changes:

- In the [High Performance](#), page 11, 66-Bit PCI was corrected to 64-Bit PCI (SAR 31977).
- The A3P250 device and VQ100 package were added to product tables in the [Military ProASIC3/EL DC and Switching Characteristics](#), page 15 chapter (SAR 30526).
- The Y security option and Licensed DPA Logo were added to the [Ordering Information](#), page 192. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 32151).
- The A3P250 device was added to applicable tables in the [Military ProASIC3/EL DC and Switching Characteristics](#), page 15 chapter (SAR 30526).
- The A3P250 device was added to applicable tables in the [Military ProASIC3/EL DC and Switching Characteristics](#), page 15 chapter (SAR 30526).
- The VPUMP voltage for operation mode was changed from "0 to 3.45 V" to "0 to 3.6 V" in [Table 7](#), page 15 (SAR 25220).
- 3.3 V LVCMOS wide range and 1.2 V LVCMOS wide range were added to applicable tables in the following sections (SAR 28061):
 - [Table 7](#), page 15
 - [Power per I/O Pin](#), page 22
 - [Overview of I/O Performance](#), page 35
 - [Summary of I/O Timing Characteristics – Default I/O Software Settings](#), page 38
 - [User I/O Characteristics](#), page 31
 - [Detailed I/O DC Characteristics](#), page 44
 - [Single-Ended I/O Characteristics](#), page 51 (SAR 31925)
- The [Quiescent Supply Current](#), page 21 was updated.
 - [Table 13](#), page 21 is new (SAR 24882, 24112, 32549).
- New values were added to the following tables (SAR 30619):
 - [Table 14](#), page 21
 - [Table 16](#), page 21
 - [Table 17](#), page 22 (the name of this table changed from "No Flash*Freeze Mode" to "Static Mode and Active Mode" per SAR 32549)
 - [Table 18](#), page 22
- The military maximum current for A3P1000 was revised in the following table (SAR 30620):
 - [Table 18](#), page 22
- All timing and power tables were updated to reflect changes in the software resulting from characterization and bug fixes (SAR 32394).
- In the following tables for A3P250 and A3P1000, the note regarding dynamic power was revised to, "Dynamic Power consumption is given for software default drive strength and output slew. Output load is lower than the software default" (SAR 32449).
 - [Table 23](#), page 25
 - [Table 24](#), page 26
- Values for A3PE600L and A3P250 were added to [Table 26](#), page 27. Values in the table, and in [Table 25](#), page 26, were updated were updated to reflect changes in the software resulting from characterization and bug fixes (SAR 30528).
- [Table 27](#), page 28 and the [Total Static Power Consumption—PSTAT](#), page 28 calculation were updated to add PDC0 (SAR 32549).
- The [Timing Model](#), page 31 was updated (SAR 29793).
- The title of [Table 34](#), page 38 was changed from "Summary of AC Memory Points" (SAR 32446).
- The following note was added to [Table 36](#), page 39, and [Table 37](#), page 41, Summary of I/O Timing Characteristics (SAR 32449):

- "Output delays provided in this table were extracted with an output load indicated in the Capacitive Load column. For a specific output load, refer to Designer software."
- Resistances and short circuit currents were updated (SARs 29793, 31717):
 - [Table 41](#), page 44
 - [Table 45](#), page 48 (SAR 31717)
 - Tables for Pro I/Os in the [Single-Ended I/O Characteristics](#), page 51 (SAR 31717).
- The drive strength was changed from 25 mA to 20 mA for 3.3 V and 2.5 V GTL (SAR 31978). This affects the following tables:
 - [Table 30](#), page 35
 - [Table 36](#), page 39 (SAR 32394)
 - [Table 37](#), page 41
 - [Table 41](#), page 44
 - [Table 45](#), page 48
 - [Table 126](#), page 86
 - [Table 130](#), page 87
- The values in [Table 44](#), page 47 were revised (SAR 29793, 28061).
- The AC Loading diagrams in the [Single-Ended I/O Characteristics](#), page 51 were updated to match summary of I/O timing tables in the [Summary of I/O Timing Characteristics – Default I/O Software Settings](#), page 38 (SAR 32449).
- The tables in the [Voltage-Referenced I/O Characteristics](#), page 86 and [Differential I/O Characteristics](#), page 97 were updated with current values (SARs 29793, 32391, 32394).
- Two note references were added to [Table 166](#), page 98 to clarify the following notes: $\pm 5\%$ [VCCI] and differential input voltage = ± 350 mV [VDIFF] (SAR 29428).
- The [Global Tree Timing Characteristics](#), page 124 was updated.
 - [Table 205](#), page 126 is new (SAR 30526).
 - Available values were added or revised in the following tables (SAR 30698):
 - [Table 201](#), page 125
 - [Table 206](#), page 127
 - [Table 203](#), page 126
- [Table 207](#), page 127 and [Military ProASIC3/EL CCC/PLL Specification For Devices Operating at 1.5 V DC Core Voltage](#), page 128 were updated with current values (SAR 32521).
- The following figures were removed (SAR 29991):
 - [Figure 2-49 • Write Access after Write onto Same Address](#)
 - [Figure 2-50 • Read Access after Write onto Same Address](#)
 - [Figure 2-51 • Write Access after Read onto Same Address](#)
- The naming of the address collision parameters in the [SRAM Timing Characteristics](#), page 133 was changed, and values were updated accordingly (SAR 29991).
- The values for t_{CKQ1} in [Table 209](#), page 133, [Table 210](#), page 134, and [Table 211](#), page 134 were reversed with respect to WMODE and have been corrected (SAR 32343).
- [Table 218](#), page 142 through [Table 222](#), page 145 are new (SAR 32394).
- Tables in the [Embedded FlashROM Characteristics](#), page 146 were updated (SAR 32392).
- The [Pin Descriptions and Packaging](#), page 149 chapter was added (SAR 21642).
- Package names used in the [Package Pin Assignments](#), page 154 were revised to match standards given in [Package Mechanical Drawings](#) (SAR 27395).
- The [VQ100](#), page 154 pin table for A3P250 is new (SAR 31975).
- The [FG484](#), page 168 pin table for A3P1000 was updated to remove the Flash*Freeze (FF) designation from pin L3. This package does not support Flash*Freeze functionality. Pin W6 of the [FG484](#), page 168 for A3PE600L was designated as the Flash*Freeze control pin for that package (SAR 24084).

2 Military ProASIC3/EL Device Family Overview

2.1 General Description

The military ProASIC3/EL family of flash FPGAs dramatically reduces dynamic power consumption by 40% and static power by 50%. These power savings are coupled with performance, density, true single chip, 1.2 V to 1.5 V core and I/O operation, reprogrammability, and advanced features.

Microsemi's proven Flash*Freeze technology enables military ProASIC3EL device users to shut off dynamic power instantaneously and switch the device to static mode without the need to switch off clocks or power supplies, and retaining internal states of the device. This greatly simplifies power management. In addition, optimized software tools using power-driven layout provide instant push-button power reduction.

Nonvolatile flash technology gives military ProASIC3/EL devices the advantage of being a secure, low-power, single-chip solution that is live at power-up (LAPU). Military ProASIC3/EL devices offer dramatic dynamic power savings, giving FPGA users flexibility to combine low power with high performance.

These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

Military ProASIC3/EL devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry (CCC) based on an integrated phase-locked loop (PLL). Military ProASIC3/EL devices support devices from 250K system gates to 3 million system gates with up to 504 kbits of true dual-port SRAM and 620 user I/Os.

M1 military ProASIC3/EL devices support the high-performance, 32-bit Cortex-M1 processor developed by ARM for implementation in FPGAs. ARM Cortex-M1 is a soft processor that is fully implemented in the FPGA fabric. It has a three-stage pipeline that offers a good balance between low-power consumption and speed when implemented in an M1 military ProASIC3/EL device. The processor runs the ARMv6-M instruction set, has a configurable nested interrupt controller, and can be implemented with or without the debug block. ARM Cortex-M1 is available at no cost from Microsemi for use in M1 military ProASIC3/EL FPGAs.

The ARM-enabled devices have ordering numbers that begin with M1 and do not support AES decryption.

2.1.1 Flash*Freeze Technology¹

Military ProASIC3EL devices offer Flash*Freeze technology, which allows instantaneous switching from an active state to a static state. When Flash*Freeze mode is activated, military ProASIC3EL devices enter a static state while retaining the contents of registers and SRAM. Power is conserved without the need for additional external components to turn off I/Os or clocks. Flash*Freeze technology is combined with in-system programmability, which enables users to quickly and easily upgrade and update their designs in the final stages of manufacturing or in the field. The ability of military ProASIC3EL devices to support a 1.2 V core voltage allows for an even greater reduction in power consumption, which enables low total system power.

When the military ProASIC3EL device enters Flash*Freeze mode, the device automatically shuts off the clocks and inputs to the FPGA core; when the device exits Flash*Freeze mode, all activity resumes and data is retained.

The availability of low-power modes, combined with a reprogrammable, single-chip, single-voltage solution, make military ProASIC3EL devices suitable for low-power data transfer and manipulation in military-temperature applications where available power may be limited (e.g., in battery-powered equipment); or where heat dissipation may be limited (e.g., in enclosures with no forced cooling).

1. Flash*Freeze technology is not supported on A3P1000.

2.1.2 Flash Advantages

2.1.2.1 Low Power¹

The military ProASIC3EL family of flash-based FPGAs provides a low-power advantage, and when coupled with high performance, enables designers to make power-smart choices using a single-chip, reprogrammable, and live-at-power-up device.

Military ProASIC3EL devices offer 40% dynamic power and 50% static power savings by reducing the core operating voltage to 1.2 V. In addition, the power-driven layout (PDL) feature in Libero[®]SoC offers up to 30% additional power reduction. With Flash*Freeze technology, military ProASIC3EL device is able to retain device SRAM and logic while dynamic power is reduced to a minimum, without the need to stop clock or power supplies. Combining these features provides a low-power, feature-rich, and high-performance solution.

2.1.2.2 Security

Nonvolatile, flash-based military ProASIC3/EL devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. Military ProASIC3/EL devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

Military ProASIC3/EL devices utilize a 128-bit flash-based lock and a separate AES key to secure programmed intellectual property and configuration data. In addition, all FlashROM data in military ProASIC3/EL devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. AES was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. Military ProASIC3/EL devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. Military ProASIC3/EL devices with AES-based security allow for secure, remote field updates over public networks such as the Internet, and ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves.

Security, built into the FPGA fabric, is an inherent component of the military ProASIC3/EL family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The military ProASIC3/EL family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected and secure, making remote ISP possible. A military ProASIC3/EL device provides the most impenetrable security for programmable logic designs.

2.1.2.3 Single Chip

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based military ProASIC3/EL FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

2.1.2.4 Live at Power-Up

Flash-based military ProASIC3/EL devices support Level 0 of the LAPU classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The LAPU feature of flash-based military ProASIC3/EL devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs. In addition, glitches and brownouts in system power will not corrupt the military ProASIC3/EL device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based military ProASIC3/EL devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

1. A3P1000 only supports 1.5 V core operation.

2.1.2.5 Reduced Cost of Ownership

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, flash-based military ProASIC3/EL devices allow all functionality to be live at power-up; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and field upgrades with confidence that valuable intellectual property cannot be compromised or copied. Secure ISP can be performed using the industry-standard AES algorithm. The military ProASIC3/EL family device architecture mitigates the need for ASIC migration at higher volumes. This makes the military ProASIC3/EL family a cost-effective ASIC replacement.

2.1.2.6 Firm-Error Immunity

Firm errors occur most commonly when high-energy neutrons, generated in the upper atmosphere, strike a configuration cell of an SRAM FPGA. The energy of the collision can change the state of the configuration cell and thus change the logic, routing, or I/O behavior in an unpredictable way. These errors are impossible to prevent in SRAM FPGAs. The consequence of this type of error can be a complete system failure. Firm errors do not exist in the configuration memory of military ProASIC3/EL flash-based FPGAs. Once it is programmed, the flash cell configuration element of military ProASIC3/EL FPGAs cannot be altered by high-energy neutrons and is therefore immune to them. Recoverable (or soft) errors occur in the user data SRAM of all FPGA devices. These can easily be mitigated by using error detection and correction (EDAC) circuitry built into the FPGA fabric.

2.1.3 Advanced Flash Technology

The military ProASIC3/EL family offers many benefits, including nonvolatility and reprogrammability, through an advanced flash-based, 130-nm LVCMOS process with 7 layers of metal. Standard CMOS design techniques are used to implement logic and control functions. The combination of fine granularity, enhanced flexible routing resources, and abundant flash switches allows for very high logic utilization without compromising device routability or performance. Logic functions within the device are interconnected through a four-level routing hierarchy.

2.1.4 Advanced Architecture

The proprietary military ProASIC3/EL architecture provides granularity comparable to standard-cell ASICs. The military ProASIC3/EL device consists of five distinct and programmable architectural features (Figure 1, page 7 and Figure 2, page 7):

- FPGA VersaTiles
- Dedicated FlashROM
- Dedicated SRAM/FIFO memory
- Extensive CCCs and PLLs
- I/O structure

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic function, a D-flip-flop (with or without enable), or a latch by programming the appropriate flash switch interconnections. The versatility of the military ProASIC3/EL core tile, as either a three-input lookup table (LUT) equivalent or a D-flip-flop/latch with enable, allows for efficient use of the FPGA fabric. The VersaTile capability is unique to the ProASIC family of third-generation-architecture flash FPGAs. VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

Figure 1 • Military ProASIC3 Device Architecture Overview with Four I/O Banks (A3P250, A3P600, and A3P1000)

Figure 2 • Military ProASIC3EL Device Architecture Overview (A3PE600L and A3PE3000L)

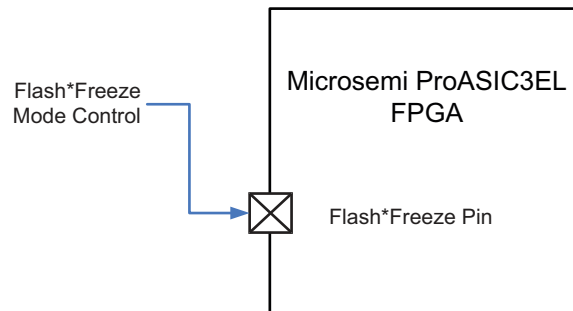

2.1.5 Flash*Freeze Technology¹

Military ProASIC3EL devices offer proven Flash*Freeze technology, which enables designers to instantaneously shut off dynamic power consumption while retaining all SRAM and register information. Flash*Freeze technology enables the user to quickly (within 1 μ s) enter and exit Flash*Freeze mode by activating the Flash*Freeze (FF) pin while all power supplies are kept at their original values. In addition, I/Os and global I/Os can still be driven and can be toggling without impact on power consumption; clocks can still be driven or can be toggling without impact on power consumption; all core registers and SRAM cells retain their states. I/Os are tristated during Flash*Freeze mode or can be set to a certain state using weak pull-up or pull-down I/O attribute configuration. No power is consumed by the I/O banks, clocks, JTAG pins, or PLLs. Flash*Freeze technology allows the user to switch to active mode on demand, thus simplifying the power management of the device.

The FF pin (active low) can be routed internally to the core to allow the user's logic to decide when it is safe to transition to this mode. It is also possible to use the FF pin as a regular I/O if Flash*Freeze mode usage is not planned, which is advantageous because of the inherent low-power static and dynamic capabilities of the military ProASIC3EL device. Refer to [Figure 3](#), page 8 for an illustration of entering/exiting Flash*Freeze mode.

Figure 3 • Military ProASIC3EL Flash*Freeze Mode

2.1.6 VersaTiles

The military ProASIC3/EL core consists of VersaTiles, which have been enhanced beyond the ProASIC^{PLUS} core tiles. The military ProASIC3/EL VersaTile supports the following:

- All 3-input logic functions—LUT-3 equivalent
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set

Refer to [Figure 4](#), page 8 for VersaTile configurations.

Figure 4 • VersaTile Configurations

1. Flash*Freeze technology is not supported for A3P1000.

2.1.6.1 User Nonvolatile FlashROM

Military ProASIC3/EL devices have 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications:

- Internet protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, set-top boxes)
- Secure key storage for secure communications algorithms
- Asset management/tracking
- Date stamping
- Version management

FlashROM is written using the standard military ProASIC3/EL IEEE 1532 JTAG programming interface. The core can be individually programmed (erased and written), and on-chip AES decryption can be used selectively to securely load data over public networks, as in security keys stored in the FlashROM for a user design.

FlashROM can be programmed via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing. Note that the FlashROM can only be programmed from the JTAG interface and cannot be programmed from the internal logic array.

FlashROM is programmed as 8 banks of 128 bits; however, reading is performed on a byte-by-byte basis using a synchronous interface. A 7-bit address from the FPGA core defines which of the 8 banks and which of the 16 bytes within that bank are being read. The three most significant bits (MSBs) of the FlashROM address determine the bank, and the four least significant bits (LSBs) of the FlashROM address define the byte.

Microsemi military ProASIC3/EL development software solutions, Libero SoC has extensive support for the FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using the Libero SoC software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

2.1.6.2 SRAM and FIFO

Military ProASIC3/EL devices have embedded SRAM blocks along their north and south sides. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro.

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal Empty and Full flags. The embedded FIFO control unit contains the counters necessary for generation of the read and write address pointers. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

2.1.6.3 PLL and CCC

Military ProASIC3 devices provide designers with flexible clock conditioning circuit (CCC) capabilities. Each member of the military ProASIC3 family contains six CCCs, located at the four corners and the centers of the east and west sides. One CCC (center west side) has a PLL. All six CCC blocks are usable; the four corner CCCs and the east CCC allow simple clock delay operations as well as clock spine access.

Military ProASIC3EL devices also contain six CCCs; however, all six are equipped with a PLL. The inputs of the six CCC blocks are accessible from the FPGA core or from one of several inputs located near the CCC that have dedicated connections to the CCC block.

The CCC block has these key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz up to 250 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz up to 250 MHz
- 2 programmable delay types for clock skew minimization
- Clock frequency synthesis

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°. Output phase shift depends on the output divider configuration.
- Output duty cycle = 50% ± 1.5% or better
- Low output jitter: worst case < 2.5% × clock period peak-to-peak period jitter when single global network used
- Maximum acquisition time is 300 μs
- Exceptional tolerance to input period jitter—allowable input jitter is up to 1.5 ns
- Four precise phases; maximum misalignment between adjacent phases of 40 ps × 250 MHz / f_{OUT_CCC}

2.1.6.4 Global Clocking

Military ProASIC3/EL devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high-fanout nets.

2.1.6.5 I/Os with Advanced I/O Standards

The military ProASIC3/EL family of FPGAs features a flexible I/O structure, supporting a range of voltages (1.5 V, 1.8 V, 2.5 V, and 3.3 V). In addition, 1.2 V I/O operation is supported for military ProASIC3EL devices. Military ProASIC3/EL FPGAs support different I/O standards, including single-ended, differential, and voltage-referenced (military ProASIC3EL). The I/Os are organized into banks, with two, four, or eight (military ProASIC3EL only) banks per device. The configuration of these banks determines the I/O standards supported. For military ProASIC3EL, each I/O bank is subdivided into V_{REF} minibanks, which are used by voltage-referenced I/Os. V_{REF} minibanks contain 8 to 18 I/Os. All the I/Os in a given minibank share a common V_{REF} line. Therefore, if any I/O in a given V_{REF} minibank is configured as a V_{REF} pin, the remaining I/Os in that minibank will be able to use that reference voltage.

Each I/O module contains several input, output, and enable registers. These registers allow the implementation of the following:

- Single-data-rate applications (e.g., PCI 66 MHz, bidirectional SSTL 2 and 3, Class I and II)
- Double-data-Rate applications (e.g., DDR LVDS, B-LVDS, and M-LVDS I/Os for point-to-point communications, and DDR 200 MHz SRAM using bidirectional HSTL Class II).

Military ProASIC3EL banks support LVPECL, LVDS, B-LVDS, and M-LVDS. B-LVDS and M-LVDS can support up to 20 loads.

2.2 Features and Benefits

2.2.1 Military Temperature Tested and Qualified

- Each Device Tested from –55 °C to 125 °C

2.2.2 Firm-Error Immune

- Not Susceptible to Neutron-Induced Configuration Loss

2.2.3 Low Power

- Dramatic Reduction in Dynamic and Static Power
- 1.2 V to 1.5 V Core and I/O Voltage Support for Low Power¹
- Low Power Consumption in Flash*Freeze Mode Allows for Instantaneous Entry To / Exit From Low-Power Flash*Freeze Mode²

- Supports Single-Voltage System Operation
- Low-Impedance Switches

2.2.4 High Capacity

- 250K to 3M System Gates
- Up to 504 Kbits of True Dual-Port SRAM
- Up to 620 User I/Os

2.2.5 Reprogrammable Flash Technology

- 130-nm, 7-Layer Metal (6 Copper), Flash-Based CMOS Process
- Live-at-Power-Up (LAPU) Level 0 Support
- Single-Chip Solution
- Retains Programmed Design when Powered Off

2.2.6 High Performance

- 350 MHz (1.5 V systems) and 250 MHz (1.2 V systems) System Performance
- 3.3 V, 66 MHz, 64-Bit PCI (1.5 V systems) and 66 MHz, 32-Bit PCI (1.2 V systems)

2.2.7 In-System Programming (ISP) and Security

- Secure ISP Using On-Chip 128-Bit Advanced Encryption Standard (AES) Decryption via JTAG (IEEE 1532-compliant)
- FlashLock[®] to Secure FPGA Contents

2.2.8 High-Performance Routing Hierarchy

- Segmented, Hierarchical Routing and Clock Structure
- High-Performance, Low-Skew Global Network
- Architecture Supports Ultra-High Utilization

2.2.9 Advanced and Pro (Professional) I/Os¹

- 700 Mbps DDR, LVDS-Capable I/Os
- 1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V Mixed-Voltage Operation[†]
- Bank-Selectable I/O Voltages—up to 8 Banks per Chip
- Single-Ended I/O Standards: LVTTTL, LVCMOS 3.3 V / 2.5 V / 1.8 V / 1.5 V / 1.2 V, 3.3 V PCI / 3.3 V PCI-X, and LVCMOS 2.5 V / 5.0 V Input[†]
- Differential I/O Standards: LVPECL, LVDS, BLVDS, and M-LVDS
- Voltage-Referenced I/O Standards: GTL+ 2.5 V / 3.3 V, GTL 2.5 V / 3.3 V, HSTL Class I and II, SSTL2 Class I and II, SSTL3 Class I and II (A3PE3000L only)
- I/O Registers on Input, Output, and Enable Paths
- Hot-Swappable and Cold-Sparing I/Os
- Programmable Output Slew Rate and Drive Strength
- Programmable Input Delay (A3PE3000L only)
- Schmitt Trigger Option on Single-Ended Inputs (A3PE3000L)
- Weak Pull-Up/-Down
- IEEE 1149.1 (JTAG) Boundary Scan Test
- Pin-Compatible Packages across the Military ProASIC[®]3EL Family

2.2.10 Clock Conditioning Circuit (CCC) and PLL

- Six CCC Blocks—One Block with Integrated PLL in ProASIC3 and All Blocks with Integrated PLL in ProASIC3EL
- Configurable Phase Shift, Multiply/Divide, Delay Capabilities, and External Feedback
- Wide Input Frequency Range 1.5 MHz to 250 MHz (1.2 V systems) and 350 MHz (1.5 V systems)

1. A3P250, A3P600 and A3P1000 support only 1.5 V core operation.

2. Flash*Freeze technology is not available for A3P250, A3P600 or A3P1000.

1. Pro I/Os are not available on A3P250, A3P600 or A3P1000.

2.2.11 SRAMs and FIFOs

- Variable-Aspect-Ratio 4,608-Bit RAM Blocks (×1, ×2, ×4, ×9, and ×18 organizations available)
- True Dual-Port SRAM (except ×18)
- 24 SRAM and FIFO Configurations with Synchronous Operation:
 - 250 MHz: For 1.2 V Systems
 - 350 MHz: For 1.5 V Systems

2.2.12 ARM[®] Processor Support in ProASIC3/EL FPGAs

- ARM Cortex™-M1 Soft Processor Available with or without Debug

Table 1 • Military ProASIC3/EL Low-Power Device

1. Refer to the [Cortex-M1 product brief](#) for more information.

2. AES is not available for ARM-enabled ProASIC3/EL devices.

Note:

- A3P250, A3P600, and A3P1000 support only 1.5 V core operation.
- Flash*Freeze technology is not available for A3P250, A3P600 or A3P1000.
- Pro I/Os are not available on A3P250, A3P600 or A3P1000.

2.3 I/Os Per Package ¹

Table 2 • I/Os Per Package

ProASIC3/EL Low Power Devices											
	A3P250		A3P600		A3PE600L		A3P1000		A3PE3000L ¹		
ARM Cortex-M1 Devices											
							M1A3P1000		M1A3PE3000L		
Package	Single- Ended I/O ²	Different ial I/O Pairs	Single- Ended I/O ²	Different ial I/O Pairs	Single- Ended I/O ²	Different ial I/O Pairs	Single- Ended I/O ²	Differen tial I/O Pairs	Single- Ended I/O ²	Different ial I/O Pairs	
VQ100	68	13									
PQ208			154	35			154	35			
FG ³ 144							97	25			
FG256							177	44			
FG484					270	135	300	74	341	168	
FG896									620	310	

- For A3PE3000L devices, the usage of certain I/O standards is limited as follows:
 - SSTL3(I) and (II): up to 40 I/Os per north or south bank
 - LVPECL / GTL+ 3.3 V / GTL 3.3 V: up to 48 I/Os per north or south bank
 - SSTL2(I) and (II) / GTL+ 2.5 V / GTL 2.5 V: up to 72 I/Os per north or south bank
- Each used differential I/O pair reduces the number of single-ended I/Os available by two.
- A3P250-FG144 package is offered in leaded version only. All other packages are both leaded and RoHS-compliant versions.

Note: When the Flash*Freeze pin is used to directly enable Flash*Freeze mode and not as a regular I/O, the number of single-ended user I/Os available is reduced by one.

2.3.1 Military ProASIC3/EL Device Status

Table 3 • Military ProASIC3/EL Device Status

Military ProASIC3/EL Devices	Status	M1 Military ProASIC3/EL Devices	Status
A3P250	Production		
A3P600	Production		
A3PE600L	Production	M1A3P1000	Production
A3P1000	Production		
A3PE3000L	Production	M1A3PE3000L	Production

1. When considering migrating your design to a lower- or higher-density device, refer to the packaging section of the datasheet to ensure you are complying with design and board migration requirements.

2.4 Temperature Grade Offerings

Table 4 • Temperature Grade Offerings

Package	A3P250	A3P600	A3PE600L	A3P1000	A3PE3000L

2. M = Military temperature range: –55 °C to 125 °C junction temperature

Note: Contact your local Microsemi SoC Products Group (formerly Actel) representative for device availability: <http://www.microsemi.com/contact/default.aspx>.

3 Military ProASIC3/EL DC and Switching Characteristics

3.1 General Specifications

3.1.1 Operating Conditions

Stresses beyond those listed in [Table 6](#), page 15 may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. absolute maximum ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in [Table 7](#) on [page 3-15](#) is not implied.

Table 6 • Absolute Maximum Ratings¹

Symbol	Parameter	Limits	Units
VCC	DC core supply voltage	-0.3 to 1.65	V
VJTAG	JTAG DC voltage	-0.3 to 3.75	V
VPUMP	Programming voltage	-0.3 to 3.75	V
VCCPLL	Analog power supply (PLL)	-0.3 to 1.65	V
VCCI	DC I/O buffer supply voltage for A3PE600/3000L DC output buffer supply voltage for A3P250, A3P600, and A3P1000	-0.3 to 3.75	V
VMV	DC input buffer supply voltage for A3P250, A3P600, A3P1000	-0.3 to 3.75	V
VI	I/O input voltage	-0.3 V to 3.6 V (when I/O hot insertion mode is enabled) -0.3 V to (VCCI + 1 V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled)	V
T _{STG} ²	Storage temperature	-65 to +150	°C
T _J ²	Junction temperature	+150	°C

1. The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in [Table 9](#), page 17.
2. For flash programming and retention maximum limits, refer to [Table 9](#), page 17, and for recommended operating limits, refer to [Table 7](#), page 15.

Table 7 • Recommended Operating Conditions¹

Symbol	Parameter	Military	Units
T _J	Junction temperature	-55 to 125 ²	°C
VCC	1.5 V DC core supply voltage ³	1.425 to 1.575	V
	1.2 V – 1.5 V wide range DC core supply voltage ⁴	1.14 to 1.575	V
VJTAG	JTAG DC voltage	1.4 to 3.6	V

Table 7 • Recommended Operating Conditions¹ (continued)

Symbol	Parameter		Military	Units
VPUMP ⁵	Programming voltage	Programming mode	3.15 to 3.45	V
		Operation ⁶	0 to 3.6	V
VCCPLL ⁵	Analog power supply (PLL)	1.5 V DC core supply voltage ³	1.425 to 1.575	V
		1.2 V – 1.5 V DC core supply voltage ⁴	1.14 to 1.575	V
VCCI and VMV ⁵	1.2 V DC supply voltage ⁴	1.2 V wide range DC supply voltage ⁴	1.14 to 1.575	V
		1.5 V DC supply voltage	1.425 to 1.575	V
		1.8 V DC supply voltage	1.7 to 1.9	V
		2.5 V DC supply voltage	2.3 to 2.7	V
		3.0 V DC supply voltage ⁷	2.7 to 3.6	V
		3.3 V DC supply voltage	3.0 to 3.6	V
		LVDS differential I/O	2.375 to 2.625	V
		LVPECL differential I/O	3.0 to 3.6	V

1. All parameters representing voltages are measured with respect to GND unless otherwise specified.
2. Default Junction Temperature Range in the Libero SoC software is set from 0°C to +70°C for commercial, and -40°C to +85°C for industrial. To ensure targeted reliability standards are met across the full range of junction temperatures, Microsemi recommends using custom settings for temperature range before running timing and power analysis tools. For more information regarding custom settings, refer to the New Project Dialog Box in the [Libero SoC Online Help](#).
3. For A3P250, A3P600, and A3P1000
4. For A3PE600L and A3PE3000L devices only, operating at VCCI ≥ VCC. Devices must be programmed with the VCC core voltage at 1.5 V. The VCC core voltage should be switched from 1.2 V to 1.5 V while programming.
5. See the [Pin Descriptions and Packaging](#), page 149 for instructions and recommendations on tie-off and supply grouping.
6. The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in [Table 30](#), page 35. VCCI should be at the same voltage within a given I/O bank.
7. 3.3 V wide range is compliant to the JESD8-B specification and supports 3.0 V VCCI operation.

To ensure if the targeted reliability standards are met across ambient and junction operating temperatures, Microsemi recommends that the user follow best design practices using Microsemi’s timing and power simulation tools.

Figure 5 • High-Temperature Data Retention (HTR)

Table 8 • Flash Programming Limits – Retention, Storage and Operating Temperature¹

Product Grade	Programming Cycles	Program Retention (biased/unbiased)	Maximum Storage Temperature TSTG (°C) ²	Maximum Operating Junction Temperature TJ (°C) ²
Commercial	500	20 years	110	100
Industrial	500	20 years	110	100

1. This is a stress rating only; functional operation at any condition other than those indicated is not implied.
2. These limits apply for program/data retention only. See Table 6 on page 3-15 and Table 7 on page 3-15 for device operating conditions and absolute limits.

Table 9 • Overshoot and Undershoot Limits¹

VCCI and VMV	Average VCCI–GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle ²	Maximum Overshoot/Undershoot (125 °C) ²
2.7 V or less	10%	0.72 V
	5%	0.82 V
3 V	10%	0.72 V
	5%	0.82 V
3.3 V	10%	0.69 V
	5%	0.79 V
3.6 V	10%	N/A
	5%	N/A

1. The duration is allowed at one out of six clock cycles. If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15 V.
2. This table does not provide PCI overshoot/undershoot limits.

3.1.2 I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Military)

Sophisticated power-up management circuitry is designed into every ProASIC[®]3 device. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in Figure 6, page 18 and Figure 7, page 19.

There are five regions to consider during power-up.

Military ProASIC3 I/Os are activated only if ALL of the following three conditions are met:

1. VCC and VCCI are above the minimum specified trip points (Figure 6, page 18 and Figure 7, page 19).
2. $VCCI > VCC - 0.75 \text{ V}$ (typical)
3. Chip is in the operating mode.
 - **VCCI Trip Point:**
Ramping up: $0.6 \text{ V} < \text{trip_point_up} < 1.2 \text{ V}$
Ramping down: $0.5 \text{ V} < \text{trip_point_down} < 1.1 \text{ V}$
 - **VCC Trip Point:**
Ramping up: $0.6 \text{ V} < \text{trip_point_up} < 1.1 \text{ V}$
Ramping down: $0.5 \text{ V} < \text{trip_point_down} < 1 \text{ V}$

VCC and VCCI ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to VCCI.
- JTAG supply, PLL power supplies, and charge pump VPUMP supply have no influence on I/O behavior.

3.1.2.1 PLL Behavior at Brownout Condition

Microsemi recommends using monotonic power supplies or voltage regulators to ensure proper power-up behavior. Power ramp-up should be monotonic, at least until VCC and VCCPLX exceed brownout activation levels. The VCC activation level is specified as 1.1 V worst-case (see Figure 6, page 18 and Figure 7, page 19 for more details).

When PLL power supply voltage and/or VCC levels drop below the VCC brownout levels (0.75 V ± 0.25 V), the PLL output lock signal goes low and/or the output clock is lost. Refer to the "Power-Up/Down Behavior of Low-Power Flash Devices" chapter of the *Military ProASIC3/EL FPGA Fabric User's Guide* for information on clock and lock recovery.

3.1.2.2 Internal Power-Up Activation Sequence

1. Core
2. Input buffers

Output buffers, after 200 ns delay from input buffer activation.

Figure 6 • Devices Operating at 1.5 V Core – I/O State as a Function of VCCI and VCC Voltage Levels

Figure 7 • Device Operating at 1.2 V Core Voltage – I/O State as a Function of VCCI and VCC Voltage Levels; Only A3PE600L and A3PE3000L Devices Operate at 1.2 V Core Voltage

3.1.3 Thermal Characteristics

3.1.3.1 Introduction

The temperature variable in the Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction temperature to be higher than the ambient temperature.

EQ can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A$$

where:

- T_A = Ambient Temperature
- ΔT = Temperature gradient between junction (silicon) and ambient $\Delta T = \theta_{ja} * P$
- θ_{ja} = Junction-to-ambient of the package. θ_{ja} numbers are located in Table 10, page 20.
- P = Power dissipation

3.1.3.2 Package Thermal Characteristics

The device junction-to-case thermal resistivity is θ_{jc} and the junction-to-ambient air thermal resistivity is θ_{ja} . The thermal characteristics for θ_{ja} are shown for two air flow rates. The recommended maximum junction temperature is 125°C. EQ shows a sample calculation of the recommended maximum power dissipation allowed for a 484-pin FBGA package at military temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. (}^\circ\text{C)} - \text{Max. ambient temp. (}^\circ\text{C)}}{\theta_{ja} (^\circ\text{C/W)}} = \frac{125^\circ\text{C} - 70^\circ\text{C}}{20.6^\circ\text{C/W}} = 2.670$$

Table 10 • Package Thermal Resistivities

Package Type	Device	Pin Count	θ_{jC}	θ_{ja}			Units
				Still Air	200 ft./min.	500 ft./min.	
Very Thin Quad Flat Pack (VQ100)	A3P250	100	10.0	35.3	29.4	27.1	C/W

VCCI / VJTAG = 1.2 V (per bank) Typical (25 °C)	1.2 V	1.7	1.7	μA
VCCI / VJTAG = 1.5 V (per bank) Typical (25 °C)	1.2 V/1.5 V	1.8	1.8	μA
VCCI / VJTAG = 1.8 V (per bank) Typical (25 °C)	1.2 V/1.5 V	1.9	1.9	μA
VCCI / VJTAG = 2.5 V (per bank) Typical (25 °C)	1.2 V/1.5 V	2.2	2.2	μA
VCCI/VJTAG = 3.3 V (per bank) Typical (25 °C)	1.2 V/1.5 V	2.5	2.5	μA

1. $IDD = N_{BANKS} \times ICCI$. Values do not include I/O static contribution, which is shown in Table 27, page 28 (PDC6 and PDC7).

Table 16 • Quiescent Supply Current (IDD) Characteristics, Shutdown Mode¹

	Core Voltage	A3P250	A3P1000	A3PE600L	A3PE3000L	Units
Nominal (25 °C)	1.2 V/1.5 V	N/A		0		μA
Military (125 °C)	1.2 V/1.5 V	N/A		0		μA

1. This is applicable to A3PE600L and A3PE3000L only for cold-separable I/O devices. Not available on A3P250 or A3P1000.

Table 17 • Quiescent Supply Current (IDD), Static Mode and Active Mode ¹

	Core Voltage	A3PE600L	A3PE3000L	Units
ICCA Current²				
Nominal (25 °C)	1.2 V	0.55	2.75	mA
	1.5 V	0.83	4.2	mA
Typical maximum (25 °C)	1.2 V	9	17	mA
	1.5 V	12	20	mA
Military maximum (125 °C)	1.2 V	65	165	mA
	1.5 V	85	185	mA
ICCI or IJTAG Current³				
VCCI/VJTAG = 1.2 V (per bank) Typical (25 °C)	1.2 V	1.7	1.7	μA
VCCI/VJTAG = 1.5 V (per bank) Typical (25 °C)	1.2 V/1.5 V	1.8	1.8	μA
VCCI/VJTAG = 1.8 V (per bank) Typical (25 °C)	1.2 V/1.5 V	1.9	1.9	μA
VCCI/VJTAG = 2.5 V (per bank) Typical (25 °C)	1.2 V/1.5 V	2.2	2.2	μA
VCCI/VJTAG = 3.3 V (per bank) Typical (25 °C)	1.2 V/1.5 V	2.5	2.5	μA

1. $IDD = NBANKS \times ICCI + ICCA$. JTAG counts as one bank when powered.
2. Includes VCC, VCCPLL, and VPUMP currents.
3. Values do not include I/O static contribution (PDC6 and PDC7).

Table 18 • Quiescent Supply Current (IDD) Characteristics for A3P250 and A3P1000

	Core Voltage	A3P250	A3P1000	Units
Nominal (25 °C)	1.5 V	3	8	mA
Typical maximum (25 °C)	1.5 V	15	30	mA
Military maximum (125 °C)	1.5 V	65	150	mA

Note: IDD includes VCC, VPUMP, VCCI, and VMV currents. Values do not include I/O static contribution (PDC6 and PDC7), which is shown in [Table 27](#), page 28.

3.1.4.2 Power per I/O Pin

**Table 19 • Summary of I/O Input Buffer Power (Per Pin) – Default I/O Software Settings

PAC12	Average contribution of a RAM block during a write operation	30.00			
PAC13	Dynamic contribution for PLL	2.60			

Table 27 • Different Components Contributing to the Static Power Consumption in Military ProASIC3/EL Devices

Parameter	Definition	Device-Specific Dynamic Power (μ W)			
		A3PE3000L	A3PE600L	A3P1000	A3P250
PDC0	Array static power in Sleep mode	0 mW	0 mW	N/A	N/A
PDC1	Array static power in Active mode	See Table 17 , page 22.			
PDC2	Array static power in Static (Idle) mode	See Table 17 , page 22.			
PDC3	Array static power in Flash*Freeze mode	See Table 14 , page 21.			
PDC4	Static PLL contribution at 1.2 V operating core voltage (for A3PE600L and A3PE3000L only)	1.42 mW		N/A	
	Static PLL contribution 1.5 V operating core voltage	2.55 mW			
PDC5	Bank quiescent power (V_{CCI} -dependent)	See Table 14 , page 21, Table 15 , page 21, Table 17 , page 22.			
PDC6	I/O input pin static power (standard-dependent)	See Table 19 , page 22. through Table 21 , page 24.			
PDC7	I/O output pin static power (standard-dependent)	See Table 22 , page 24 through Table 24 , page 26.			

Note: For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi power spreadsheet calculator or SmartPower tool in the Libero SoC.

3.1.4.4 Power Calculation Methodology

This section describes a simplified method to estimate power consumption of an application. For more accurate and detailed power estimations, use the SmartPower tool in the Libero SoC software.

The power calculation methodology described below uses the following variables:

- The number of PLLs as well as the number and the frequency of each output clock generated
- The number of combinatorial and sequential cells used in the design
- The internal clock frequencies
- The number and the standard of I/O pins used in the design
- The number of RAM blocks used in the design
- Toggle rates of I/O pins as well as VersaTiles—guidelines are provided in [Table 28](#), page 30.
- Enable rates of output buffers—guidelines are provided for typical applications in [Table 29](#), page 30.
- Read rate and write rate to the memory—guidelines are provided for typical applications in [Table 29](#), page 30. The calculation should be repeated for each clock domain defined in the design.

3.1.4.5 Methodology

3.1.4.5.1 Total Power Consumption— P_{TOTAL}

$$P_{TOTAL} = P_{STAT} + P_{DYN}$$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

3.1.4.5.2 Total Static Power Consumption— P_{STAT}

$$P_{STAT} = (PDC0 \text{ or } PDC1 \text{ or } PDC2 \text{ or } PDC3) + N_{BANKS} * P_{DC5} + N_{INPUTS} * PDC6 + N_{OUTPUTS} * PDC7$$

N_{INPUTS} is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

N_{BANKS} is the number of I/O banks powered in the design.

3.1.4.5.3 Total Dynamic Power Consumption— P_{DYN}

$$P_{DYN} = P_{CLOCK} + P_{S-CELL} + P_{C-CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL}$$

3.1.4.5.4 Global Clock Contribution— P_{CLOCK}

$$P_{CLOCK} = (PAC1 + N_{SPINE} * PAC2 + N_{ROW} * PAC3 + N_{S-CELL} * PAC4) * F_{CLK}$$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in Table 28, page 30.

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in Table 28, page 30.

F_{CLK} is the global clock signal frequency.

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design.

PAC1, PAC2, PAC3, and PAC4 are device-dependent.

3.1.4.5.5 Sequential Cells Contribution— P_{S-CELL}

$$P_{S-CELL} = N_{S-CELL} * (PAC5 + \alpha_1 / 2 * PAC6) * F_{CLK}$$

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design. When a multi-tile sequential cell is used, it should be accounted for as 1.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 28, page 30.

F_{CLK} is the global clock signal frequency.

3.1.4.5.6 Combinatorial Cells Contribution— P_{C-CELL}

$$P_{C-CELL} = N_{C-CELL} * \alpha_1 / 2 * PAC7 * F_{CLK}$$

N_{C-CELL} is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 28, page 30.

F_{CLK} is the global clock signal frequency.

3.1.4.5.7 Routing Net Contribution— P_{NET}

$$P_{NET} = (N_{S-CELL} + N_{C-CELL}) * \alpha_1 / 2 * PAC8 * F_{CLK}$$

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design.

N_{C-CELL} is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 28, page 30.

F_{CLK} is the global clock signal frequency.

3.1.4.5.8 I/O Input Buffer Contribution— P_{INPUTS}

$$P_{INPUTS} = N_{INPUTS} * \alpha_2 / 2 * PAC9 * F_{CLK}$$

N_{INPUTS} is the number of I/O input buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in Table 28, page 30.

F_{CLK} is the global clock signal frequency.

3.1.4.5.9 I/O Output Buffer Contribution— $P_{OUTPUTS}$

$$P_{OUTPUTS} = N_{OUTPUTS} * \alpha_2 / 2 * \beta_1 * PAC10 * F_{CLK}$$

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in Table 28, page 30.

β_1 is the I/O buffer enable rate—guidelines are provided in Table 29, page 30.

F_{CLK} is the global clock signal frequency.

3.1.4.5.10 RAM Contribution— P_{MEMORY}

$$P_{MEMORY} = P_{AC11} * N_{BLOCKS} * F_{READ-CLOCK} * \beta_2 + P_{AC12} * N_{BLOCK} * F_{WRITE-CLOCK} * \beta_3$$

N_{BLOCKS} is the number of RAM blocks used in the design.

$F_{READ-CLOCK}$ is the memory read clock frequency.

β_2 is the RAM enable rate for read operations.

$F_{WRITE-CLOCK}$ is the memory write clock frequency.

β_3 is the RAM enable rate for write operations—guidelines are provided in Table 29, page 30.

3.1.4.5.11 PLL Contribution— P_{PLL}

$$P_{PLL} = P_{DC4} + P_{AC13} * F_{CLKOUT}$$

F_{CLKOUT} is the output clock frequency.¹

3.1.4.6 Guidelines

3.1.4.6.1 Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that this net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100% because all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
 - Bit 0 (LSB) = 100%
 - Bit 1 = 50%
 - Bit 2 = 25%
 - ...
 - Bit 7 (MSB) = 0.78125%
 - Average toggle rate = (100% + 50% + 25% + 12.5% + . . . + 0.78125%) / 8

3.1.4.6.2 Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When nontristate output buffers are used, the enable rate should be 100%.

Table 28 • Toggle Rate Guidelines Recommended for Power Calculation

Component	Definition	Guideline
α_1	Toggle rate of VersaTile outputs	10%
α_2	I/O buffer toggle rate	10%

Table 29 • Enable Rate Guidelines Recommended for Power Calculation

Component	Definition	Guideline
β_1	I/O output buffer enable rate	100%
β_2	RAM enable rate for read operations	12.5%
β_3	RAM enable rate for write operations	12.5%

1. If a PLL is used to generate more than one output clock, include each output clock in the formula by adding its corresponding contribution ($P_{AC13} * F_{CLKOUT}$ product) to the total PLL contribution.

3.1.5 User I/O Characteristics

3.1.5.1 Timing Model

Figure 8 • Timing Model Operating Conditions: –1 Speed, Military Temperature Range (TJ = 125 °C), Worst-Case VCC = 1.14 V (example for A3PE3000L and A3PE600L)

1. Note that 1.2 V LVCMOS and 3.3 V LVCMOS wide range is applicable to 100 μ A drive strength only. The configuration will not operate at the equivalent software default drive strength. These values are for normal ranges only.
2. Currents are measured at 125°C junction temperature.
3. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD-8B specification.
4. Applicable to A3PE600L and A3PE3000L devices operating at VCCI \geq VCC.
5. All LVCMOS 1.2 V software macros support LVCMOS 1.2 V wide range as specified in the JESD8-12 specification.
6. Output drive strength is below JEDEC specification.

Note: Output slew rate can be extracted using the IBIS Models.

- Note that 1.2 V LVCMOS and 3.3 V LVCMOS wide range are applicable to 100 μ A drive strength only. The configuration will not operate at the equivalent software default drive strength. These values are for normal ranges only.
- Output delays provided in this table were extracted with an output load indicated in the Capacitive Load column. For a specific output load, refer to Designer software.
- All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.
- All LVCMOS 1.2 V software macros support LVCMOS 1.2 V wide range as specified in the JESD8-12 specification.
- Resistance is used to measure I/O propagation delays as defined in PCI specifications. See Figure 19, page 85 for connectivity. This resistor is not required during normal operation.
- Output drive strength is below JEDEC specification.

Note: For specific junction temperature and voltage supply levels, refer to Table 11, page 20 for derating values.

LVPECL	24 mA		High			0.52	1.40	0.03	1.61								

- Note that 3.3 V LVCMOS wide range is applicable to 100 μA drive strength only. The configuration will not operate at the equivalent software default drive strength. These values are for normal ranges only.
- Output delays provided in this table were extracted with an output load indicated in the Capacitive Load column. For a specific output load, refer to Designer software.
- All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.s
- Resistance is used to measure I/O propagation delays as defined in PCI specifications. See Figure 19, page 85 for connectivity. This resistor is not required during normal operation.
- Output drive strength is below JEDEC specification.

Note: For specific junction temperature and voltage supply levels, refer to Table 11, page 20 for derating values.

Table 38 • Summary of I/O Timing Characteristics—Software Default Settings
 –1 Speed Grade, Military-Case Conditions: $T_J = 125\text{ }^\circ\text{C}$, Worst Case $V_{CC} = 1.425\text{ V}$, Worst Case V_{CCI} Applicable to Advanced I/O Banks for A3P250 and A3P1000 Only

1.5V LVCMOS	2mA	13	16
	4mA	25	33
3.3 V PCI/PCI-X	Per PCI/PCI-X specification	103	109

1. T_J = 100 °C

Table 48 • Schmitt Trigger Input Hysteresis, Hysteresis Voltage Value (typical) for Schmitt Mode Input Buffers Applicable to A3PE600L and A3PE3000L Only

Input Buffer Configuration	Hysteresis Value (typical)
3.3 V LVTTTL/LVCMOS/PCI/PCI-X (Schmitt trigger mode)	240 mV
2.5 V LVCMOS (Schmitt trigger mode)	140 mV
1.8 V LVCMOS (Schmitt trigger mode)	80 mV
1.5 V LVCMOS (Schmitt trigger mode)	60 mV
1.2 V LVCMOS (Schmitt trigger mode)	40 mV

The length of time an I/O can withstand I_{OSH}/I_{OSL} events depends on the junction temperature. The reliability data below is based on a 3.3 V, 12 mA I/O setting, which is the worst case for this type of analysis.

For example, at 110°C, the short current condition would have to be sustained for more than three months to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

Table 49 • Duration of Short Circuit Event before Failure

Temperature (°C)	Time before Failure
-50	> 20 years
-40	> 20 years
0	> 20 years
25	> 20 years
70	5 years
85	2 years
100	6 months
110	3 months
125	1 month

Table 50 • I/O Input Rise Time, Fall Time, and Related I/O Reliability

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)	Reliability
LVTTL/LVCMOS	No requirement	10 ns *	20 years (110 °C)
LVDS/B-LVDS/ M-LVDS/LVPECL	No requirement	10 ns *	10 years (100 °C)

Note: The maximum input rise/fall time is related to the noise induced in the input buffer trace. If the noise is low, the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure that there is no excessive noise coupling into input signals.

3.1.5.4 Single-Ended I/O Characteristics

3.1.5.4.1 3.3 V LVTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic (LVTTL) is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTL input buffer and push-pull output buffer.

Table 51 • Minimum and Maximum DC Input and Output Levels Applicable to Pro I/Os for A3PE600L and A3PE3000L Only

3.3 V LVTTL / 3.3 V LVCMOS Drive Strength	VIL		VIH		VOL Max. V	VOH Min. V	IO L IO H		IOSL Max. mA ³	IOSH Max. mA ³	IIL ¹ μA ⁴	IIH ² μA ⁴
	Min. V	Max. V	Min. V	Max. V			mA	mA				
4 mA	-0.3	0.8	2	3.6	0.4	2.4	4	4	25	27	15	15
8 mA	-0.3	0.8	2	3.6	0.4	2.4	8	8	51	54	15	15
12 mA	-0.3	0.8	2	3.6	0.4	2.4	12	12	103	109	15	15
16 mA	-0.3	0.8	2	3.6	0.4	2.4	16	16	132	127	15	15
24 mA	-0.3	0.8	2	3.6	0.4	2.4	24	24	268	181	15	15

1. I_{IL} is the input leakage current per I/O pin over recommended operation conditions where $-0.3V < V_{IN} < V_{IL}$.
2. I_{IH} is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside.
3. Currents are measured at 100°C junction temperature and maximum voltage.
4. Currents are measured at 125°C junction temperature.

Note: Software default selection highlighted in gray.

Table 52 • Minimum and Maximum DC Input and Output Levels Applicable to Advanced I/O Banks for A3P250 and A3P1000 Only

1. I_{IL} is the input leakage current per I/O pin over recommended operation conditions where $-0.3V < V_{IN} < V_{IL}$.
2. I_{IH} is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside.
3. Currents are measured at 100 °C junction temperature and maximum voltage.
4. Currents are measured at 125 °C junction temperature.

Note: Software default selection highlighted in gray.

- For specific junction temperature and voltage supply levels, refer to [Table 12](#), page 20 for derating values.

3.1.5.6 3.3 V LVCMOS Wide Range

Table 64 • Minimum and Maximum DC Input and Output Levels Applicable to Pro I/O Banks for A3PE600L and A3PE3000L Only

3.3 V LVCMOS Wide Range Drive Strength	Equiv. Software Default Drive Option ¹	VIL		VIH		VOL		VOH		IOL	IOH	IOSL	IOSH	IIL ²	IIH ³
		Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	μA	μA						
100 μA	2 mA	-0.3	0.8	2	3.6	0.2	VCCI - 0.2	100	100	25	27	15	15		
100 μA	4 mA	-0.3	0.8	2	3.6	0.2	VCCI - 0.2	100	100	25	27	15	15		
100 μA	6 mA	-0.3	0.8	2	3.6	0.2	VCCI - 0.2	100	100	51	54	15	15		
100 μA	12 mA	-0.3	0.8	2	3.6	0.2	VCCI - 0.2	100	100	103	109	15	15		
100 μA	16 mA	-0.3	0.8	2	3.6	0.2	VCCI - 0.2	100	100	132	127	15	15		
100 μA	24 mA	-0.3	0.8	2	3.6	0.2	VCCI - 0.2	100	100	268	181	15	15		

1. Note that 3.3 V LVCMOS wide range is applicable to 100 μA drive strength only. The configuration will not operate at the equivalent software default drive strength. These values are for normal ranges only.
2. I_{IL} is the input leakage current per I/O pin over recommended operation conditions where $-0.3\text{ V} < V_{IN} < V_{IL}$.
3. I_{IH} is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.
4. Currents are measured at 125°C junction temperature.
5. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-A specification.

Note: Software default selection highlighted in gray.

Table 65 • Minimum and Maximum DC Input and Output Levels Applicable to Advanced I/O Banks

3.1.5.8 2.5 V LVCMOS

Low-Voltage CMOS for 2.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 2.5 V applications.

Table 76 • Minimum and Maximum DC Input and Output Levels Applicable to Pro I/Os for A3PE600L and A3PE3000L Only

2.5 V LVCMOS Drive Strength	VIL		VIH		VOL	VOH	I_{OL}	I_{OH}	I_{OSL}	I_{OSH}	I_{IL}^1	I_{IH}^2
	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA ³	Max. mA ³	μA^4	μA^4
4 mA	-0.3	0.7	1.7	3.6	0.7	1.7	4	4	16	18	15	15

16 mA	-0.3	0.7	1.7	3.6	0.7	1.7	16	16	83	87	15	15
24 mA	-0.3	0.7	1.7	3.6	0.7	1.7	24	24	169	124	15	15

- I_{IL} is the input leakage current per I/O pin over recommended operation conditions where $-0.3\text{ V} < V_{IN} < V_{IL}$.
- I_{IH} is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.
- Currents are measured at 100 $^\circ\text{C}$ junction temperature and maximum voltage.
- Currents are measured at 125 $^\circ\text{C}$ junction temperature.

Note: Software default selection highlighted in gray.

Table 77 • Minimum and Maximum DC Input and Output Levels Applicable to Advanced I/O Banks

3.1.5.10 1.8 V LVCMOS

Low-voltage CMOS for 1.8 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.8 V applications. It uses a 1.8 V input buffer and a push-pull output buffer.

Table 88 • Minimum and Maximum DC Input and Output Levels Applicable to Pro I/Os for A3PE600L and A3PE3000L Only

1.8 V LVCMOS Drive Strength	VIL		VIH		VOL	VOH	I_{OL}	I_{OH}	I_{OSL}	I_{OSH}	I_{IL}^1	I_{IH}^2
	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	m A	m A	Max. mA ³	Max. mA ³	μA^4	μA^4
2 mA	-0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.45	VCCI - 0.45	2	2	9	11	15	15
4 mA	-0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.45	VCCI - 0.45	4	4	17	22	15	15
6 mA	-0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.45	VCCI - 0.45	6	6	35	44	15	15
8 mA	-0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.45	VCCI - 0.45	8	8	45	51	15	15
12 mA	-0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.45	VCCI - 0.45	12	12	91	74	15	15
16 mA	-0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.45	VCCI - 0.45	16	16	91	74	15	15

1. I_{IL} is the input leakage current per I/O pin over recommended operation conditions where $-0.3\text{ V} < V_{IN} < V_{IL}$.
2. I_{IH} is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges
3. Currents are measured at $100\text{ }^\circ\text{C}$ junction temperature and maximum voltage.
4. Currents are measured at $125\text{ }^\circ\text{C}$ junction temperature.

Note: Software default selection highlighted in gray.

Table 89 • Minimum and Maximum DC Input and Output Levels Applicable to Advanced I/O Banks

1.8 V LVCMOS													
Drive Strength	VIL		VIH		VOL		VOH	IOL	IOH	IOSL	IOSH	IIL ¹	IIH ²

3.1.5.12 1.5 V LVCMOS (JESD8-11)

Low-Voltage CMOS for 1.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.5 V applications. It uses a 1.5 V input buffer and a push-pull output buffer.

Table 100 • Minimum and Maximum DC Input and Output Levels Applicable to Pro I/Os for A3PE600L and A3PE3000L Only

1.5 V LVCMOS Drive Strength	V_{IL}		V_{IH}		V_{OL}	V_{OH}	I_O		I_{OL}	I_{OSL}	I_{OSH}	I_{IL}^1	I_{IH}^2
	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	I_{OL} mA	I_{OH} mA	Max. mA ³	Max. mA ³	Max. mA ³	μA^4	μA^4
2 mA	-0.3	0.35 * V_{CCI}	0.65 * V_{CCI}	3.6	0.25 * V_{CCI}	0.75 * V_{CCI}	2	2	13	16	15	15

1. I_{IL} is the input leakage current per I/O pin over recommended operation conditions where $-0.3\text{ V} < V_{IN} < V_{IL}$.
2. I_{IH} is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.
3. Currents are measured at $100\text{ }^\circ\text{C}$ junction temperature and maximum voltage.
4. Currents are measured at $125\text{ }^\circ\text{C}$ junction temperature.

Note: Software default selection highlighted in gray.

3.1.5.14 1.2 V LVCMOS (JESD8-12A)

Low-Voltage CMOS for 1.2 V complies with the LVCMOS standard JESD8-12A for general purpose 1.2 V applications. It uses a 1.2 V input buffer and a push-pull output buffer.

Table 112 • Minimum and Maximum DC Input and Output Levels Applicable to Pro I/O Banks for A3PE600L and A3PE3000L Only

1.2 V LVCMOS ¹ VIL		VIH		VOL		VOH		IO _L	IO _H	IOSH	IOSL	IIL ²	IIH ³
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	Max. V	mA	mA	mA	mA	μA ⁵	μA ⁵
2 mA	-0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.25 * VCCI	0.75 * VCCI	2	2	TBD	TBD	TBD	15	15

1. Applicable to A3PE600L and A3PE3000L devices only.
2. IIL is the input leakage current per I/O pin over recommended operation conditions where $-0.3 \text{ V} < V_{IN} < V_{IL}$.
3. IIH is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.
4. Currents are measured at 100 °C junction temperature and maximum voltage.
5. Currents are measured at 125 °C junction temperature.

Note: Software default selection highlighted in gray.

Figure 17 • AC Loading

Note:

- Software default selection highlighted in gray.
- For specific junction temperature and voltage supply levels, refer to [Table 11](#), page 20 for derating values.

3.1.5.16 1.2 V LVC MOS Wide Range

Table 116 • Minimum and Maximum DC Input and Output Levels Applicable to Pro I/O Banks for A3PE600L and A3PE3000L Operating at 1.2 V Core Voltage

1.2 V LVC MOS Wide Range ¹	Equiv. Software Default Drive	V_{IL}		V_{IH}	V_{OL}		V_{OH}	I_{OL}	I_{OH}	I_{OSH}	I_{OSL}	I_{IL} ³	I_{IH} ⁴
Drive Strength	Strength Option ²	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	μA	μA	mA ⁵	mA ⁵	μA ⁶	μA ⁶
100 μA	2 mA	-0.3	0.3 * V_{CCI}	0.7 * V_{CCI}	3.6	0.25 * V_{CCI}	0.75 * V_{CCI}	100	100	TBD	TBD	15	15

1. Applicable to A3PE600L and A3PE3000L devices only.
2. Note that 1.2 V LVC MOS wide range is applicable to 100 μA drive strength only. The configuration will not operate at the equivalent software default drive strength. These values are for normal ranges only.
3. I_{IL} is the input leakage current per I/O pin over recommended operation conditions where $-0.3\text{ V} < V_{IN} < V_{IL}$.
4. I_{IH} is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.
5. Currents are measured at 100 $^\circ\text{C}$ junction temperature and maximum voltage.
6. Currents are measured at 125 $^\circ\text{C}$ junction temperature.

Note: Software default selection highlighted in gray.

3.1.5.23 HSTL Class I

High-Speed Transceiver Logic is a general-purpose high-speed 1.5 V bus standard (EIA/JESD8-6). Military ProASIC3E devices support Class I. This provides a differential amplifier input buffer and a push-pull output buffer.

Table 142 • Minimum and Maximum DC Input and Output Levels

HSTL Class I	VIL		VIH		VOL	VOH	IO _L	IO _H	IOS _L	IOS _H	I _{IL} ¹	I _{IH} ²
	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	m A	m A	Max. mA ³	Max. mA ³	μA ⁴	μA ⁴
8 mA	–0.3	VREF – 0.1	VREF + 0.1	3.6	0.4	VCCI – 0.4	8	8	32	39	15	15

1. I_{IL} is the input leakage current per I/O pin over recommended operating conditions where $-0.3\text{ V} < V_{IN} < V_{IL}$.

2. I_{IH} is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.
3. Currents are measured at 100 °C junction temperature and maximum voltage.
4. Currents are measured at 125 °C junction temperature.

Figure 24 • AC Loading

3.1.5.24 HSTL Class II

High-Speed Transceiver Logic is a general-purpose high-speed 1.5 V bus standard (EIA/JESD8-6). Military ProASIC3E devices support Class II. This provides a differential amplifier input buffer and a push-pull output buffer.

Table 146 • Minimum and Maximum DC Input and Output Levels

HSTL Class II	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL ¹	IIH ²
	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	m A	m A	Max. mA ³	Max. mA ³	μA ⁴	μA ⁴
15 mA ⁵	-0.3	VREF - 0.1	VREF + 0.1	3.6	0.4	VCCI - 0.4	15	15	66	55	15	15

1. I_{IL} is the input leakage current per I/O pin over recommended operating conditions where -0.3 V < V_{IN} < V_{IL}.
2. I_{IH} is the input leakage current per I/O pin over recommended operating conditions V_{IH} < V_{IN} < V_{CCI}. Input current is larger when operating outside recommended ranges.
3. Currents are measured at 100 °C junction temperature and maximum voltage.
4. Currents are measured at 125 °C junction temperature.
5. Output drive strength is below JEDEC specification.

3.1.6 Differential I/O Characteristics

3.1.6.1 Physical Implementation

Configuration of the I/O modules as a differential pair is handled by Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with the LVPECL standards.

3.1.6.2 LVDS

Low-Voltage Differential Signaling (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 20](#), page 86. The building blocks of the LVDS transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

Along with LVDS I/O, military ProASIC3 also supports Bus LVDS structure and Multipoint LVDS (M-LVDS) configuration (up to 40 nodes).

Figure 30 • LVDS Circuit Diagram and Board-Level Implementation

Table 166 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Typ.	Max.	Units
VCCI	Supply Voltage	2.375	2.5	2.625	V
VOL	Output Low Voltage	0.9	1.075	1.25	V
VOH	Output High Voltage	1.25	1.425	1.6	V
IOL ¹	Output Lower Current	0.65	0.91	1.16	mA
IOH ¹	Output High Current	0.65	0.91	1.16	mA
VI	Input Voltage	0		2.925	V
IIH ^{2,3}	Input High Leakage Current			10	μA
IIL ^{2,4}	Input Low Leakage Current			10	μA
VODIFF	Differential Output Voltage	250	350	450	mV
VOCM	Output Common Mode Voltage	1.125	1.25	1.375	V
VICM	Input Common Mode Voltage	0.05	1.25	2.35	V
VIDIFF	Input Differential Voltage	100	350		mV

1. IOL/IOH is defined by VODIFF/(Resistor Network).
2. Currents are measured at 125 °C junction temperature.
3. IIH is the input leakage current per IO pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.
4. IIL is the input leakage current per I/O pin over recommended operation conditions where $-0.3 \text{ V} < V_{IN} < V_{IL}$.

3.1.6.4 B-LVDS/M-LVDS

Bus LVDS (B-LVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. Microsemi LVDS drivers provide the higher drive current required by B-LVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF_LVDS and BIBUF_LVDS macros along with appropriate terminations. Multipoint designs using Microsemi LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in Figure 21, page 87. The input and output buffer delays are

available in the LVDS section in Table 166, page 98.

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case Industrial operating conditions, at the farthest receiver: $R_S = 60 \Omega$ and $R_T = 70 \Omega$, given $Z_0 = 50 \Omega$ (2") and $Z_{stub} = 50 \Omega$ (~1.5").

Figure 31 • B-LVDS/M-LVDS Multipoint Application Using LVDS I/O Buffers

3.1.6.5 LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 22, page 88. The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

Figure 32 • LVPECL Circuit Diagram and Board-Level Implementation

Table 171 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Max.	Min.	Max.	Min.	Max.	Units

3.1.9 VersaTile Specifications as a Sequential Module

The military ProASIC3 library offers a wide variety of sequential cells, including flip-flops and latches. Each has a data input and optional enable, clear, or preset. In this section, timing characteristics are presented for a representative sample from the library. For more details, refer to the *IGLOO, Fusion, and ProASIC3 Macro Library Guide*.

Figure 44 • Sample of Sequential Cells

Table 200 • Register Delays: Military-Case Conditions: $T_J = 125\text{ }^\circ\text{C}$, Worst-Case $V_{CC} = 1.425\text{ V}$ for A3P250, A3P600, and A3P1000 (continued)

Parameter	Description	-1	Std.	Units
t_{CKMPWL}	Clock Minimum Pulse Width LOW for the Core Register	0.37	0.43	ns

Note: For specific junction temperature and voltage supply levels, refer to [Table 12](#), page 20 for derating values.

3.1.10 Global Resource Characteristics

3.1.10.1 A3P1000 Clock Tree Topology

Clock delays are device-specific. [Figure 35](#), page 105 is an example of a global tree used for clock routing. The global tree presented in [Figure 35](#), page 105 is driven by a CCC located on the west side of the A3P1000 device. It is used to drive all D-flip-flops in the device.

Figure 46 • Example of Global Tree Use in an A3P1000 Device for Clock Routing

3.1.10.2 Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard-dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the [Clock Conditioning Circuits](#), page 127. [Table 201](#), page 125 to [Table 204](#) on page 3-126 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

3.1.10.3 Timing Characteristics

3.1.10.3.1 1.2 V DC Core Voltage

Table 201 • A3PE600L Global Resource: Military-Case Conditions: $T_J = 125\text{ }^\circ\text{C}$, $V_{CC} = 1.14\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input LOW Delay for Global Clock	0.95	1.23	1.12	1.44	ns
t_{RCKH}	Input HIGH Delay for Global Clock	0.94	1.26	1.10	1.48	ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock					ns
t_{RCKSW}	Maximum Skew for Global Clock		0.32		0.38	ns
F_{RMAX}	Maximum Frequency for Global Clock					MHz

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).

Note: For specific junction temperature and voltage supply levels, refer to [Table 11](#), page 20 for derating values.

Table 202 • A3PE3000L Global Resource: Military-Case Conditions: $T_J = 125\text{ }^\circ\text{C}$, $V_{CC} = 1.14\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input LOW Delay for Global Clock	1.81	2.09	2.13	2.42	ns
t_{RCKH}	Input HIGH Delay for Global Clock	1.80	2.13	2.12	2.45	ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock					ns
t_{RCKSW}	Maximum Skew for Global Clock		0.32		0.38	ns
F_{RMAX}	Maximum Frequency for Global Clock					MHz

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).

Note: For specific junction temperature and voltage supply levels, refer to [Table 11](#), page 20 for derating values.

3.1.10.3.2 1.5 V DC Core Voltage

Table 203 • A3PE600L Global Resource: Military-Case Conditions: $T_J = 125\text{ }^\circ\text{C}$, $V_{CC} = 1.425\text{ V}$

t _{RCKMPWH}	Minimum Pulse Width High for Global Clock					ns
t _{RCKMPWL}	Minimum Pulse Width Low for Global Clock					ns
t _{RCKSW}	Maximum Skew for Global Clock		0.30		0.35	ns
F _{RMAX}	Maximum Frequency for Global Clock					MHz

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).

Note: For specific junction temperature and voltage supply levels, refer to [Table 11](#), page 20 for derating values.

Table 204 • A3PE3000L Global Resource: Military-Case Conditions: $T_J = 125\text{ }^\circ\text{C}$, $V_{CC} = 1.425\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	
t _{RCKL}	Input Low Delay for Global Clock	1.62	1.87	1.90	2.20	ns

$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock					ns
t_{RCKSW}	Maximum Skew for Global Clock		0.32		0.37	ns
F_{RMAX}	Maximum Frequency for Global Clock					MHz

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).

Note: For specific junction temperature and voltage supply levels, refer to [Table 12](#), page 20 for derating values.

3.1.11 Clock Conditioning Circuits

3.1.11.1 CCC Electrical Specifications

3.1.11.1.1 Timing Characteristics

Table 207 • Military ProASIC3/EL CCC/PLL Specification For Devices Operating at 1.2 V DC Core Voltage: Applicable to A3PE600L and A3PE3000L Only

Parameter	Min.	Typ.	Max.	Units
Clock Conditioning Circuitry Input Frequency f_{IN_CCC}	1.5		250	MHz
Clock Conditioning Circuitry Output Frequency f_{OUT_CCC}	0.75		250	MHz
Delay Increments in Programmable Delay Blocks ^{1, 2, 3}		360		ps
Number of Programmable Values in Each Programmable Delay Block			32	
Serial Clock (SCLK) for Dynamic PLL ⁴			100	MHz
Input cycle-to-cycle jitter (peak magnitude)			1	ns
Acquisition Time				
		LockControl = 0	300	μ s
		LockControl = 1	6.0	ms
Tracking Jitter ⁵				
		LockControl = 0	25	ns
		LockControl = 1	1.5	ns

Table 207 • Military ProASIC3/EL CCC/PLL Specification For Devices Operating at 1.2 V DC Core Voltage: Applicable to A3PE600L and A3PE3000L Only (continued)

Parameter	Min.	Typ.	Max.	Units
Output Duty Cycle	48.5		51.5	%
Delay Range in Block: Programmable Delay 1 ^{1,2}	1.2		15.65	ns
Delay Range in Block: Programmable Delay 2 ^{1,2}	0.025		15.65	ns
Delay Range in Block: Fixed Delay ^{1,2}		3.5		ns
CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT}	Max. Peak-to-Peak Period Jitter ^{6,7}			
	SSO \leq 2	SSO \leq 4	SSO \leq 8	SSO \leq 16
0.75 MHz to 50 MHz	0.50%	0.60%	0.80%	1.60%
50 MHz to 160 MHz	2.50%	4.00%	6.00%	12.00%

1. This delay is a function of voltage and temperature. See Table 11, page 20 for deratings.
2. $T_J = 25^\circ\text{C}$, $V_{CC} = 1.2\text{ V}$.
3. When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the online help associated with the core for more information.
4. Maximum value obtained for a -1 speed grade device in worst-case military conditions. For specific junction temperature and voltage supply levels, refer to Table 11, page 20 for derating values.
5. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by period jitter parameter.
6. Measurements done with LVTTTL 3.3 V, 8 mA I/O drive strength and high slew rate. $V_{CC}/V_{CCPLL} = 1.14\text{V}$, VQ/PQ/TQ type of packages, 20 pF load.
7. Switching I/Os are placed outside of the PLL bank.

Table 208 • Military ProASIC3/EL CCC/PLL Specification For Devices Operating at 1.5 V DC Core Voltage

Parameter	Min.	Typ.	Max.	Units
Clock Conditioning Circuitry Input Frequency f_{IN_CCC}	1.5		350	MHz
Clock Conditioning Circuitry Output Frequency f_{OUT_CCC}	0.75		350	MHz
Delay Increments in Programmable Delay Blocks ^{1, 2, 3}		160		ps
Number of Programmable Values in Each Programmable Delay Block			32	
Serial Clock (SCLK) for Dynamic PLL ⁴			110	MHz
Input cycle-to-cycle jitter (peak magnitude)			1.5	ns
Acquisition Time	LockControl = 0		300	μs
	LockControl = 1		6.0	ms
Tracking Jitter ⁵	LockControl = 0		1.6	ns
	LockControl = 1		0.8	ns
Output Duty Cycle	48.5		51.5	%
Delay Range in Block: Programmable Delay 1 ^{1,2}	0.6		5.56	ns
Delay Range in Block: Programmable Delay 2 ^{1,2}	0.025		5.56	ns
Delay Range in Block: Fixed Delay ^{1,2}		2.2		ns
CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT}	Max. Peak-to-Peak Period Jitter ^{6,7}			
	SSO \leq 2	SSO \leq 4	SSO \leq 8	SSO \leq 16

Table 208 • Military ProASIC3/EL CCC/PLL Specification For Devices Operating at 1.5 V DC Core Voltage

Parameter	Min.	Typ.	Max.	Units
0.75 MHz to 50 MHz	0.50%	0.50%	0.70%	1.00%
50 MHz to 250 MHz	1.00%	3.00%	5.00%	9.00%
250 MHz to 350 MHz	2.50%	4.00%	6.00%	12.00%

1. This delay is a function of voltage and temperature. See [Table 11](#), page 20 for deratings.
2. $T_j = 25^\circ\text{C}$, $V_{CC} = 1.5\text{ V}$.
3. When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the online help associated with the core for more information.
4. Maximum value obtained for a -1 speed grade device in worst-case military conditions. For specific junction temperature and voltage supply levels, refer to [Table 11](#), page 20 for derating values.
5. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by period jitter parameter.
6. Measurements done with LVTTTL 3.3 V, 8 mA I/O drive strength and high slew rate. $V_{CC}/V_{CCPLL} = 1.425\text{ V}$, VQ/PQ/TQ type of packages, 20 pF load.
7. Switching I/Os are placed outside of the PLL bank.

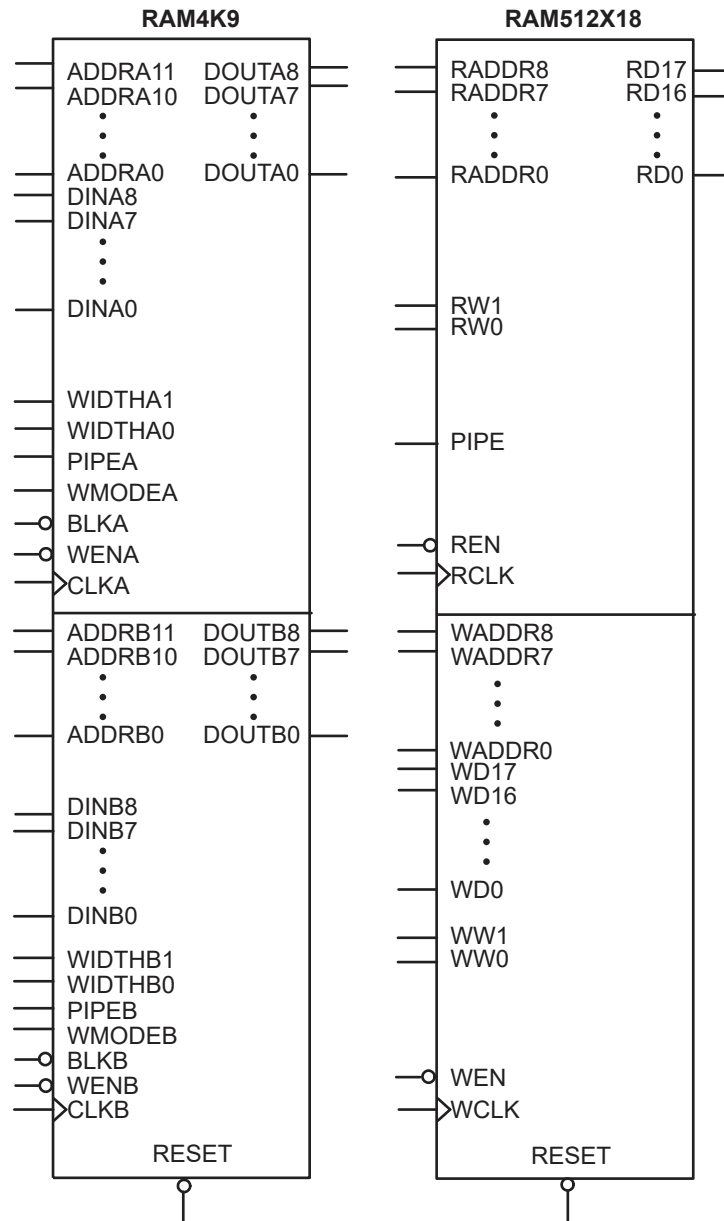

Figure 47 • Peak-to-Peak Jitter Definition

Note: Peak-to-peak jitter measurements are defined by $T_{\text{peak-to-peak}} = T_{\text{period_max}} - T_{\text{period_min}}$.

Note: For specific junction temperature and voltage supply levels, refer to [Table 11](#), page 20 for derating values.

4 Pin Descriptions and Packaging

4.1 Supply Pins

4.1.1 GND Ground

Ground supply voltage to the core, I/O outputs, and I/O logic.

4.1.2 GNDQ Ground (quiet)

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

4.1.3 VCC Core Supply Voltage

Supply voltage to the FPGA core, nominally 1.5 V for A3P250, A3P600, and A3P100 devices and 1.2 V or 1.5 V for A3PE600L and A3PE3000L devices. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

For A3PE600L and A3PE3000L devices, VCC can be switched dynamically from 1.2 V to 1.5 V or vice versa. This allows in-system programming (ISP) when VCC is at 1.5 V and the benefit of low power operation when VCC is at 1.2 V.

4.1.4 VCCIBx I/O Supply Voltage

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to eight I/O banks on low power flash devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCIBx supply. VCCI can be 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VCCI pins tied to GND.

4.1.5 VMVx I/O Supply Voltage (quiet)

Quiet supply voltage to the input buffers of each I/O bank. x is the bank number. Within each I/O bank, the VMV and VCCI are connected to each other to improve the ESD discharge path for any I/O pin against its VMV pin. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMVx supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMVx can be 1.2 V (A3PE600L and A3PE3000L only), 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCIB0, VMV1 to VCCIB1, etc.).

4.1.6 VCCPLA/B/C/D/E/F PLL Supply Voltage

Supply voltage to analog PLL, nominally 1.5 V or 1.2 V, depending on the device.

- 1.5 V for A3P250, A3P600, and A3P1000 devices
- 1.2 V or 1.5 V for A3PE600L or A3PE3000L devices

When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *Military ProASIC3/EL Device Family User's Guide* for a complete board solution for the PLL analog power supply and ground.

- There is one VCCPLF pin on A3P250, A3P600, and A3P1000 devices.

- There are six VCCPLX pins on A3PE600L and A3PE3000L devices.

4.1.7 VCOMPLA/B/C/D/E/F PLL Ground

Ground to analog PLL power supplies. When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.

- There is one VCOMPLF pin on A3P250, A3P600, and A3P1000 devices.
- There are six VCOMPL pins (PLL ground) on A3PE600L and A3PE3000L devices.

4.1.8 VJTAG JTAG Supply Voltage

Military ProASIC3/EL devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND. It should be noted that VCC is required to be powered for JTAG operation; VJTAG alone is insufficient. If a device is in a JTAG chain of interconnected boards, the board containing the device can be powered down, provided both VJTAG and VCC to the part remain powered; otherwise, JTAG signals will not be able to transition the device, even in bypass mode.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

4.1.9 VPUMP Programming Supply Voltage

A3P250, A3P600, and A3P1000 devices support single-voltage ISP of the configuration flash and FlashROM. For programming, VPUMP should be 3.3 V nominal. During normal device operation, VPUMP can be left floating or can be tied (pulled up) to any voltage between 0 V and the VPUMP maximum. Programming power supply voltage (VPUMP) range is listed in [Table 7](#), page 15.

When the VPUMP pin is tied to ground, it will shut off the charge pump circuitry, resulting in no sources of oscillation from the charge pump circuitry.

For proper programming, 0.01 μ F and 0.33 μ F capacitors (both rated at 16 V) are to be connected in parallel across VPUMP and GND, and positioned as close to the FPGA pins as possible.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

4.2 User-Defined Supply Pins

4.2.1 VREF I/O Voltage Reference

Reference voltage for I/O minibanks in A3PE600L and A3PE3000L devices. VREF pins are configured by the user from regular I/Os, and any I/O in a bank, except JTAG I/Os, can be designated the voltage reference I/O. Only certain I/O standards require a voltage reference—HSTL (I) and (II), SSTL2 (I) and (II), SSTL3 (I) and (II), and GTL/GTL+. One VREF pin can support the number of I/Os available in its minibank.

4.3 User Pins

4.3.1 I/O—User Input/Output

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected.

During programming, I/Os become tristated and weakly pulled up to VCCI. With VCCI, VMV, and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os are instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)

- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

4.3.2 GL—Globals

GL I/Os have access to certain clock conditioning circuitry (and the PLL) and/or have direct access to the global network (spines). Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities. Unused GL pins are configured as inputs with pull-up resistors.

See more detailed descriptions of global I/O connectivity in the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *Military ProASIC3/EL FPGA Fabric User's Guide*. All inputs labeled GC/GF are direct inputs into the quadrant clocks. For example, if GAA0 is used for an input, GAA1 and GAA2 are no longer available for input to the quadrant globals. All inputs labeled GC/GF are direct inputs into the chip-level globals, and the rest are connected to the quadrant globals. The inputs to the global network are multiplexed, and only one input can be used as a global input.

Refer to the "I/O Structures in IGLOO and ProASIC3 Devices" chapter (for A3P250, A3P600, and A3P1000) or "I/O Structures in IGLOOe and ProASIC3E Devices" (for A3PE600L and A3PE3000L) of the *Military ProASIC3/EL FPGA Fabric User's Guide* for an explanation of the naming of global pins.

4.3.3 FF—Flash*Freeze Mode Activation Pin

Flash*Freeze is available on A3PE600L and A3PE3000L devices. The FF pin is a dedicated input pin used to enter and exit Flash*Freeze mode. The FF pin is active low, has the same characteristics as a single-ended I/O, and must meet the maximum rise and fall times. When Flash*Freeze mode is not used in the design, the FF pin is available as a regular I/O. The FF pin can be configured as a Schmitt trigger input.

When Flash*Freeze mode is used, the FF pin must not be left floating to avoid accidentally entering Flash*Freeze mode. While in Flash*Freeze mode, the Flash*Freeze pin should be constantly asserted.

The Flash*Freeze pin can be used with any single-ended I/O standard supported by the I/O bank in which the pin is located, and input signal levels compatible with the I/O standard selected. The FF pin should be treated as a sensitive asynchronous signal. When defining pin placement and board layout, simultaneously switching outputs (SSOs) and their effects on sensitive asynchronous pins must be considered.

Unused FF or I/O pins are tristated with weak pull-up. This default configuration applies to both Flash*Freeze mode and normal operation mode. No user intervention is required.

Table 228, page 151 shows the Flash*Freeze pin location on the available packages for Military ProASIC3/EL devices. The Flash*Freeze pin location is independent of device, allowing migration to larger or smaller devices while maintaining the same pin location on the board. Refer to the "Flash*Freeze Technology and Low Power Modes" chapter of the *Military ProASIC3/EL FPGA Fabric User Guide* for more information on I/O states during Flash*Freeze mode.

Table 228 • Flash*Freeze Pin Location in Military ProASIC3/EL Packages (device-independent)

Military ProASIC3/EL Packages	Flash*Freeze Pin
FG484	W6
FG896	AH4

4.4 JTAG Pins

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). VCC must also be powered for the JTAG state machine to operate, even if the device is in bypass mode; VJTAG alone is insufficient. Both VJTAG and VCC to the part must be supplied to allow JTAG signals to transition the device. Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND.

4.4.1 TCK—Test Clock

Test clock input for JTAG boundary scan, ISP, and UJTAG. The TCK pin does not have an internal pull-up/down resistor. If JTAG is not used, Microsemi recommends tying off TCK to GND through a resistor placed close to the FPGA pin. This prevents JTAG operation in case TMS enters an undesired state.

Note that to operate at all VJTAG voltages, 500 Ω to 1 k Ω will satisfy the requirements. Refer to [Table 229](#), page 152 for more information.

Table 229 • Recommended Tie-Off Values for the TCK and TRST Pins

VJTAG	Tie-Off Resistance
VJTAG at 3.3 V	200 Ω to 1 k Ω
VJTAG at 2.5 V	200 Ω to 1 k Ω
VJTAG at 1.8 V	500 Ω to 1 k Ω
VJTAG at 1.5 V	500 Ω to 1 k Ω

Note:

- Equivalent parallel resistance if more than one device is on the JTAG chain.
- The TCK pin can be pulled up/down.
- The TRST pin is pulled down.

4.4.2 TDI—Test Data Input

Serial input for JTAG boundary scan, ISP, and UJTAG usage. There is an internal weak pull-up resistor on the TDI pin.

4.4.3 TDO—Test Data Output

Serial output for JTAG boundary scan, ISP, and UJTAG usage.

4.4.4 TMS—Test Mode Select

The TMS pin controls the use of the IEEE 1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

4.4.5 TRST—Boundary Scan Reset Pin

The TRST pin functions as an active low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the test access port (TAP) is held in reset mode. The resistor values must be chosen from [Table 229](#), page 152 and must satisfy the parallel resistance value requirement. The values in [Table 229](#), page 152 correspond to the resistor recommended when a single device is used, and the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

In critical applications, an upset in the JTAG circuit could allow entrance to an undesired JTAG state. In such cases, Microsemi recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500 Ω to 1 k Ω will satisfy the requirements.

4.5 Special Function Pins

4.5.1 NC—No Connect

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

4.5.2 DC—Do Not Connect

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

4.6 Packaging

Semiconductor technology is constantly shrinking in size while growing in capability and functional integration. To enable next-generation silicon technologies, semiconductor packages have also evolved to provide improved performance and flexibility.

Microsemi consistently delivers packages that provide the necessary mechanical and environmental protection to ensure consistent reliability and performance. Microsemi IC packaging technology efficiently supports high-density FPGAs with large-pin-count Ball Grid Arrays (BGAs), but is also flexible enough to accommodate stringent form factor requirements for Chip Scale Packaging (CSP). In addition, Microsemi offers a variety of packages designed to meet your most demanding application and economic requirements for today's embedded and mobile systems.

6 Ordering Information

The following figure describes each element in the ordering information.

Figure 67 • Military ProASIC3/EL Ordering Information

Military ProASIC3/EL Devices

A3P250 = 250,000 System Gates
 A3P600 = 600,000 System Gates
 A3PE600L = 600,000 System Gates
 A3P1000 = 1,000,000 System Gates
 A3PE3000L = 3,000,000 System Gates

Military ProASIC3/EL Devices with ARM Cortex-M1

M1A3P1000 = 1,000,000 System Gates
 M1A3PE3000L = 3,000,000 System Gates
