

JW100G and JW150G Power Modules; dc-dc Converters: 36 Vdc to 75 Vdc Input, 2.5 Vdc Output; 50 W to 75 W

The JW100G and JW150G Power Modules use advanced, surface-mount technology and delivers high-quality, efficient, and compact dc-dc conversion.

Applications

- Distributed power architectures
- Computer equipment
- Communications equipment

Options

- Heat sinks available for extended operation
- Choice of remote on/off logic configuration
- Short pins: 3.68 mm ± 0.25 mm (0.145 in. ±0.010 in.)

Description

The JW100G and JW150G Power Modules are dc-dc converter that operate over an input voltage range of 36 Vdc to 75 Vdc and provide a precisely regulated dc output. The outputs are fully isolated from the inputs, allowing versatile polarity configurations and grounding connections. The module has a maximum power ratings of 50 W to 75 W at a typical full-load efficiency of 76%.

The sealed modules offer a metal baseplate for excellent thermal performance. Threaded-through holes are provided to allow easy mounting or addition of a heat sink for high-temperature applications. The standard feature set includes remote sensing, output trim, and remote on/off for convenient flexibility in distributed power applications.

Features

- Small size: 61.0 mm x 57.9 mm x 12.7 mm (2.40 in. x 2.28 in. x 0.50 in.)
- High power density
- High efficiency: 76% typical
- Low output noise
- Constant frequency
- Industry-standard pinout
- Metal baseplate and case ground pin
- 2:1 input voltage range
- Overcurrent, overtemperature, and overvoltage protection
- Remote sense and remote on/off
- Adjustable output voltage
- Manufacturing facilities registered against the ISO* 9000 series standards
- UL† 60950 Recognized, CSA‡ C22.2 No. 60950-00 Certified, and VDE§ 0805 (IEC**60950, 4th Edition) Licensed
- CE mark meets 73/23/EEC and 93/68/EEC directives††

* ISO is a registered trademark of the International Organization for Standardization.

† UL is a registered trademark of Underwriters Laboratories, Inc.

‡ CSA is a registered trademark of Canadian Standards Association.

§ VDE is a trademark of Verband Deutscher Elektrotechniker e.V.

** IEC is a trademark of International Elektrotechniker Commission.

†† This product is intended for integration into end-use equipment. All the required procedures for CE marking of end-use equipment should be followed. (The CE mark is placed on selected products.)

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Parameter	Symbol	Min	Max	Unit
Input Voltage:				
Continuous	V_I	—	80	Vdc
Transient (100 ms)	$V_{I, trans}$	—	100	V
I/O Isolation Voltage	—	—	1500	Vdc
Operating Case Temperature (See Thermal Considerations section.)	T_C	-40	100	°C
Storage Temperature	T_{stg}	-55	125	°C

Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage, resistive load, and temperature conditions.

Table 1. Input Specifications

Parameter	Symbol	Min	Typ	Max	Unit
Operating Input Voltage	V_I	36	48	75	Vdc

Input Ripple Rejection (120 Hz)	—	—	60	—	dB

Fusing Considerations

CAUTION: This power module is not internally fused. An input line fuse must always be used.

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of a sophisticated power architecture. To preserve maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a normal-blow fuse with a maximum rating of 20 A (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data for further information.

Solder, Cleaning, and Drying Considerations

Post solder cleaning is usually the final circuit-board assembly process prior to electrical testing. The result of inadequate circuit-board cleaning and drying can affect both the reliability of a power module and the testability of the finished circuit-board assembly. For guidance on appropriate soldering, cleaning, and drying procedures, refer to the *Board-Mounted Power Modules Soldering and Cleaning* Application Note (AP97-021EPS).

Characteristic Curves

The following figures provide typical characteristics for the power module. The figures are identical for both on/off configurations.

Test Configurations

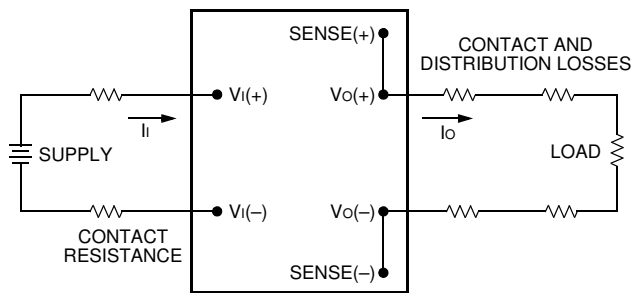

Note: Measure input reflected-ripple current with a simulated source inductance (L_{TEST}) of 12 μ H. Capacitor C_s offsets possible battery impedance. Measure current as shown above.

Figure 15. Input Reflected-Ripple Test Setup

Note: Use a 1 μ F ceramic capacitor and a 10 μ F aluminum or tantalum capacitor. Scope measurement should be made using a BNC socket. Position the load between 51 mm and 76 mm (2 in. and 3 in.) from the module.

Figure 16. Peak-to-Peak Output Noise Measurement Test Setup

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

$$\eta = \left(\frac{[V_O(+)] - [V_O(-)] I_o}{[V_I(+)] - [V_I(-)] I_i} \right) \times 100 \quad \%$$

Figure 17. Output Voltage and Efficiency Measurement Test Setup

Design Considerations

Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. For the test configuration in Figure 15, a 33 μF electrolytic capacitor (ESR < 0.7 Ω at 100 kHz) mounted close to the power module helps ensure stability of the unit. For other highly inductive source impedances, consult the factory for further application guidelines.

Safety Considerations

For safety-agency approval of the system in which the power module is used, the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standard, i.e., *UL1950*, *CSA C22.2 No. 950-95*, and *VDE 0805 (EN60950, IEC950)*.

If the input source is non-SELV (ELV or a hazardous voltage greater than 60 Vdc and less than or equal to 75 Vdc), for the module's output to be considered meeting the requirements of safety extra-low voltage (SELV), all of the following must be true:

- The input source is to be provided with reinforced insulation from any hazardous voltages, including the ac mains.
- One V_I pin and one V_O pin are to be grounded, or both the input and output pins are to be kept floating.
- The input pins of the module are not operator accessible.
- Another SELV reliability test is conducted on the whole system, as required by the safety agencies, on the combination of supply source and the subject module to verify that under a single fault, hazardous voltages do not appear at the module's output.

Note: Do not ground either of the input pins of the module without grounding one of the output pins. This may allow a non-SELV voltage to appear between the output pin and ground.

The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

The input to these units is to be provided with a maximum 20 A normal-blow fuse in the ungrounded lead.

Feature Descriptions

Overcurrent Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. If the output voltage is pulled very low during a severe fault, the current-limit circuit can exhibit either foldback or tailout characteristics (output current decrease or increase). The unit operates normally once the output current is brought back into its specified range.

Remote On/Off

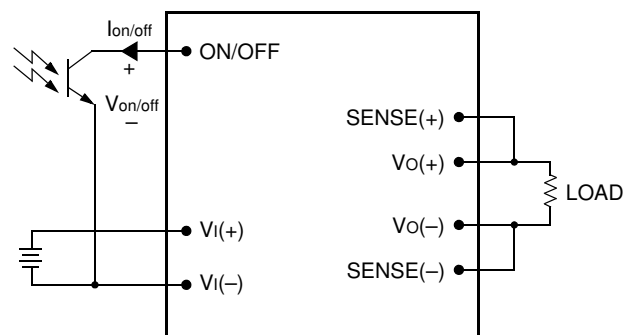

Two remote on/off options are available. Positive logic remote on/off turns the module on during a logic-high voltage on the ON/OFF pin, and off during a logic low. Negative logic remote on/off turns the module off during a logic high and on during a logic low. Negative logic (code suffix "1") is the factory-preferred configuration.

To turn the power module on and off, the user must supply a switch to control the voltage between the on/off terminal and the $V_I(-)$ terminal ($V_{on/off}$). The switch can be an open collector or equivalent (see Figure 18). A logic low is $V_{on/off} = 0\text{ V}$ to 1.2 V. The maximum $I_{on/off}$ during a logic low is 1 mA. The switch should maintain a logic-low voltage while sinking 1 mA.

During a logic high, the maximum $V_{on/off}$ generated by the power module is 15 V. The maximum allowable leakage current of the switch at $V_{on/off} = 15\text{ V}$ is 50 μA .

If not using the remote on/off feature, do one of the following:

- For negative logic, short the ON/OFF pin to $V_I(-)$.
- For positive logic, leave the ON/OFF pin open.

8-720 (F).c

Figure 18. Remote On/Off Implementation

Feature Descriptions (continued)

Remote Sense

Remote sense minimizes the effects of distribution losses by regulating the voltage at the remote-sense connections. The voltage between the remote-sense pins and the output terminals must not exceed the output voltage sense range given in the Feature Specifications table, i.e.:

$$[V_{O(+)} - V_{O(-)}] - [SENSE(+)-SENSE(-)] \leq 0.5 \text{ V}$$

The voltage between the $V_{O(+)}$ and $V_{O(-)}$ terminals must not exceed 3.0 V. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment (trim). See Figure 19.

If not using the remote-sense feature to regulate the output at the point of load, then connect SENSE(+) to $V_{O(+)}$ and SENSE(-) to $V_{O(-)}$ at the module.

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim. Consult the factory if you need to increase the output voltage more than the above limitation.

The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power.

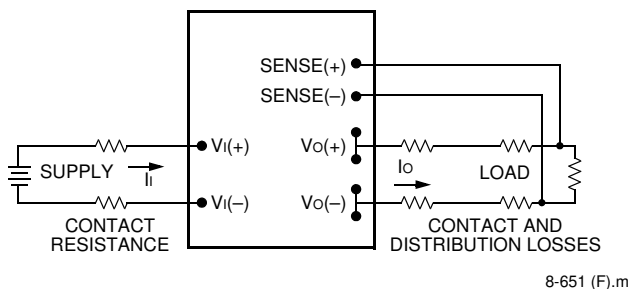

Figure 19. Effective Circuit Configuration for Single-Module Remote-Sense Operation

Output Voltage Set-Point Adjustment (Trim)

Output voltage trim allows the user to increase or decrease the output voltage set point of a module. This is accomplished by connecting an external resistor between the TRIM pin and either the SENSE(+) or SENSE(-) pins. The trim resistor should be positioned close to the module.

If not using the trim feature, leave the TRIM pin open.

With an external resistor between the TRIM and SENSE(-) pins ($R_{\text{adj-down}}$), the output voltage set point ($V_{O, \text{adj}}$) decreases (see Figure 20). The following equation determines the required external-resistor value to obtain a percentage output voltage change of $\Delta\%$.

$$R_{\text{adj-down}} = \left(\frac{100}{\Delta\%} - 2 \right) \text{ k}\Omega$$

With an external resistor connected between the TRIM and SENSE(+) pins ($R_{\text{adj-up}}$), the output voltage set point ($V_{O, \text{adj}}$) increases (see Figure 21).

The following equation determines the required external-resistor value to obtain a percentage output voltage change of $\Delta\%$.

$$R_{\text{adj-up}} = \left(\frac{V_O(100 + \Delta\%)}{1.225\Delta\%} - \frac{(100 + 2\Delta\%) V_O}{\Delta\%} \right) \text{ k}\Omega$$

The voltage between the $V_{O(+)}$ and $V_{O(-)}$ terminals must not exceed 3.8 V. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment (trim). See Figure 19.

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim. Consult the factory if you need to increase the output voltage more than the above limitation.

The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power.

Feature Descriptions (continued)

Output Voltage Set-Point Adjustment (Trim) (continued)

Figure 20. Circuit Configuration to Decrease Output Voltage

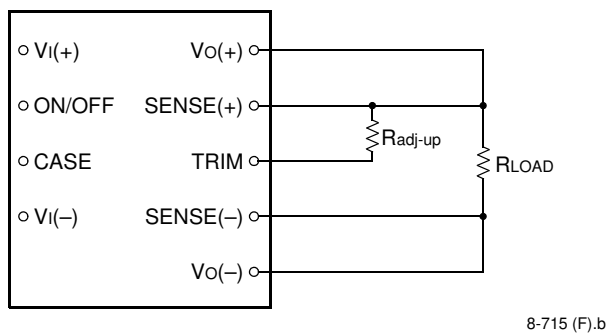

Figure 21. Circuit Configuration to Increase Output Voltage

Output Overvoltage Protection

The output overvoltage clamp consists of control circuitry, independent of the primary regulation loop, that monitors the voltage on the output terminals. The control loop of the clamp has a higher voltage set point than the primary loop (see Feature Specifications table). This provides a redundant voltage control that reduces the risk of output overvoltage.

Thermal Considerations

Introduction

The power modules operate in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat-dissipating components inside the unit are thermally coupled to the case. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the case temperature. Peak temperature (T_C) occurs at the position indicated in Figure 22.

Note: Top view, pin locations are for reference only.
Measurements shown in millimeters and (inches).

Figure 22. Case Temperature Measurement Location

The temperature at this location should not exceed 100 °C. The output power of the module should not exceed the rated power for the module as listed in the Ordering Information table.

Although the maximum case temperature of the power module is 100 °C, you can limit this temperature to a lower value for extremely high reliability.

For additional information on these modules, refer to the *Thermal Management JC-, JFC-, JW-, and JFW-Series 50 W to 150 W Board-Mounted Power Modules Technical Note (TN97-008EPS)*.

Thermal Considerations (continued)

Heat Transfer Without Heat Sinks

Increasing airflow over the module enhances the heat transfer via convection. Figure 23 shows the maximum power that can be dissipated by the module without exceeding the maximum case temperature versus local ambient temperature (T_A) for natural convection through 4 m/s (800 ft./min.).

Note that the natural convection condition was measured at 0.05 m/s to 0.1 m/s (10 ft./min. to 20 ft./min.); however, systems in which these power modules may be used typically generate natural convection airflow rates of 0.3 m/s (60 ft./min.) due to other heat dissipating components in the system. The use of Figure 23 is shown in the following example.

Example

What is the minimum airflow necessary for a JW150G operating at $V_I = 55$ V, an output current of 30 A, and a maximum ambient temperature of 40 °C?

Solution

Given: $V_I = 55$ V
 $I_O = 30$ A
 $T_A = 40$ °C

Determine P_D (Use Figure 25.):

$$P_D = 23.5 \text{ W}$$

Determine airflow (v) (Use Figure 23.):

$$v = 3.0 \text{ m/s (600 ft./min.)}$$

8-1150 (F).a

1-0061

Figure 24. JW100G Power Dissipation vs. Output Current

8-1944 (F)

Figure 25. JW150G Power Dissipation vs. Output Current

Heat Transfer with Heat Sinks

The power modules have through-threaded, M3 x 0.5 mounting holes, which enable heat sinks or cold plates to attach to the module. The mounting torque must not exceed 0.56 N-m (5 in.-lb.).

For a screw attachment from the pin side, the recommended hole size on the customer's PWB around the mounting holes is 0.130 ± 0.005 inches. If a larger hole is used, the mounting torque from the pin side must not exceed 0.25 N-m (2.2 in.-lb.).

Thermal Considerations (continued)

Heat Transfer with Heat Sinks (continued)

Thermal derating with heat sinks is expressed by using the overall thermal resistance of the module. Total module thermal resistance (θ_{ca}) is defined as the maximum case temperature rise ($\Delta T_{C, \max}$) divided by the module power dissipation (P_D):

$$\theta_{ca} = \left[\frac{\Delta T_{C, \max}}{P_D} \right] = \left[\frac{(T_C - T_A)}{P_D} \right]$$

The location to measure case temperature (T_C) is shown in Figure 22. Case-to-ambient thermal resistance vs. airflow is shown, for various heat sink configurations and heights, in Figure 26. These curves were obtained by experimental testing of heat sinks, which are offered in the product catalog.

Figure 26. Case-to-Ambient Thermal Resistance Curves; Either Orientation

These measured resistances are from heat transfer from the sides and bottom of the module as well as the top side with the attached heat sink; therefore, the case-to-ambient thermal resistances shown are generally lower than the resistance of the heat sink by itself. The module used to collect the data in Figure 26 had a thermal-conductive dry pad between the case and the heat sink to minimize contact resistance. The use of Figure 26 is shown in the following example.

Example

If an 85 °C case temperature is desired, what is the minimum airflow necessary? Assume the JW150G module is operating at $V_I = 55$ V and an output current of 30 A, maximum ambient air temperature of 40 °C, and the heat sink is 1/2 inch.

Solution

Given: $V_I = 55$ V
 $I_O = 30$ A
 $T_A = 40$ °C
 $T_C = 85$ °C
 Heat sink = 1/2 inch

Determine P_D by using Figure 25:

$$P_D = 23.5 \text{ W}$$

Then solve the following equation:

$$\theta_{ca} = \left[\frac{(T_C - T_A)}{P_D} \right]$$

$$\theta_{ca} = \left[\frac{(85 - 40)}{23.5} \right]$$

$$\theta_{ca} = 1.9 \text{ °C/W}$$

Use Figure 26 to determine air velocity for the 1/2 inch heat sink.

The minimum airflow necessary for the JW150G module is 2.1 m/s (420 ft./min.).

Thermal Considerations (continued)

Custom Heat Sinks

A more detailed model can be used to determine the required thermal resistance of a heat sink to provide necessary cooling. The total module resistance can be separated into a resistance from case-to-sink (θ_{cs}) and sink-to-ambient (θ_{sa}) shown below (Figure 27).

8-1304 (F).e

Figure 27. Resistance from Case-to-Sink and Sink-to-Ambient

For a managed interface using thermal grease or foils, a value of $\theta_{cs} = 0.1 \text{ }^\circ\text{C/W}$ to $0.3 \text{ }^\circ\text{C/W}$ is typical. The solution for heat sink resistance is:

$$\theta_{sa} = \left[\frac{(T_C - T_A)}{P_D} \right] - \theta_{cs}$$

This equation assumes that all dissipated power must be shed by the heat sink. Depending on the user-defined application environment, a more accurate model, including heat transfer from the sides and bottom of the module, can be used. This equation provides a conservative estimate for such instances.

EMC Considerations

For assistance with designing for EMC compliance, please refer to the *FLTR100V10 Filter Module Data Sheet* (DS99-294EPS).

Layout Considerations

Copper paths must not be routed beneath the power module mounting inserts. For additional layout guidelines, refer to the *FLTR100V10 Filter Module Data Sheet* (DS99-294EPS).

48 V	2.5 V	75 W	30 A	Negative	JW150G1	108457706
48 V	2.5 V	75 W	30 A	Positive	JW150G	TBD

Optional features can be ordered using the suffixes shown in Table 5. The suffixes follow the last letter of the device code and are placed in descending order. For example, the device code for a JW100G1 module with the following option is shown below:

Short pins JW100G61

Table 5. Device Options

Option	Suffix
Short pins: 3.68 mm ± 0.25 mm (0.145 in. ± 0.010 in.)	6

Ordering Information (continued)

Table 6. Device Accessories

Accessory	Comcode
1/4 in. transverse kit (heat sink, thermal pad, and screws)	407243989
1/4 in. longitudinal kit (heat sink, thermal pad, and screws)	407243997
1/2 in. transverse kit (heat sink, thermal pad, and screws)	407244706
1/2 in. longitudinal kit (heat sink, thermal pad, and screws)	407244714
1 in. transverse kit (heat sink, thermal pad, and screws)	407244722
1 in. longitudinal kit (heat sink, thermal pad, and screws)	407244730
1 1/2 in. transverse kit (heat sink, thermal pad, and screws)	407244748
1 1/2 in. longitudinal kit (heat sink, thermal pad, and screws)	407244755

Dimensions are in millimeters and (inches).
