Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

CY91460P Series

FR60 32-bit Microcontroller

CY91460P series is a line of general-purpose 32-bit RISC microcontrollers designed for embedded control applications which require high-speed real-time processing, such as consumer devices and on-board vehicle systems. This series uses the FR60 CPU, which is compatible with the FR family of CPUs.

This series contains the LIN-USART and CAN controllers.

Features

FR60 CPU core

- 32-bit RISC, load/store architecture, five-stage pipeline
- 16-bit fixed-length instructions (basic instructions)
- Instruction execution speed: 1 instruction per cycle
- Instructions including memory-to-memory transfer, bit manipulation, and barrel shift instructions: Instructions suitable for embedded applications
- Function entry/exit instructions and register data multi-load store instructions : Instructions supporting C language
- Register interlock function: Facilitating assembly-language coding
- Built-in multiplier with instruction-level support
  - Signed 32-bit multiplication: 5 cycles
  - Signed 16-bit multiplication: 3 cycles
- Interrupts (save PC/PS) : 6 cycles (16 priority levels)
- Harvard architecture enabling program access and data access to be performed simultaneously
- Instructions compatible with the FR family

Internal peripheral resources

- General-purpose ports : Maximum 141 ports
- DMAC (DMA Controller)
  - Maximum of 5 channels able to operate simultaneously
  - 2 transfer sources (internal peripheral/software)
  - Activation source can be selected using software
  - Addressing mode specifies full 32-bit addresses (increment/decrement/fixed)
  - Transfer mode (demand transfer/burst transfer/step transfer/block transfer)
  - Transfer data size selectable from 8/16/32-bit
  - Multi-byte transfer enabled (by software)
  - DMAC descriptor in I/O areas (200_H to 240_H, 1000_H to 1024_H)
- A/D converter (successive approximation type)
  - 10-bit resolution: maximum 41 channels *
  - Conversion time: minimum 1 µs
- External interrupt inputs : 16 channels *
  - 9 channels shared with CAN RX or I^2C pins
- Bit search module (for REALOS)
  - Function to search the first bit position of “1”, “0”, “changed” from the MSB (most significant bit) within one word
- LIN-USART (full duplex double buffer): 12 channels, 4 channels with FIFO *
  - Clock synchronous/asynchronous selectable
  - Sync-break detection
  - Internal dedicated baud rate generator
- I^2C bus interface (supports 400 kbps): 4 channels
  - Master/slave transmission and reception
  - Arbitration function, clock synchronization function
- CAN controller (C-CAN): up to 4 channels
  - Maximum transfer speed: 1 Mbps
  - 32 transmission/reception message buffers
- Sound generator : 1 channel
  - Tone frequency : PWM frequency divide-by-two (reload value + 1)
- 16-bit PPG timer : 32 channels *
- 16-bit PFM timer : 1 channel
- 16-bit reload timer: 16 channels
  - 8 reload timers can be used as up to 4 32-bit reload timers (by cascading 2 reload timers each).
- 16-bit free-run timer: 8 channels (1 channel each for ICU and OCU)
- Input capture: 8 channels (operates in conjunction with the free-run timer)
- Output compare: 8 channels (operates in conjunction with the free-run timer)
- Up/Down counter: 4 channels (4*8-bit or 2*16-bit) *
- Watchdog timer
- Real-time clock
- Low-power consumption modes : Sleep/stop mode function
- Low voltage detection circuit
- Clock supervisor
  - Monitors the sub-clock (32 kHz) and the main clock (4 MHz) , and switches to a recovery clock (CR oscillator, etc.) when the oscillations stop.

Note: * The maximum channel count is given; the real number depends on port multiplexing.

- Clock modulator
- Clock monitor
- Sub-clock calibration
  - Corrects the real-time clock timer when operating with the 32 kHz or CR oscillator
- Main oscillator stabilization timer
  - Generates an interrupt in sub-clock mode after the stabilization wait time has elapsed on the 23-bit stabilization wait time counter
- Sub-oscillator stabilization timer
  - Generates an interrupt in main clock mode after the stabilization wait time has elapsed on the 15-bit stabilization wait time counter

Package and technology

- Package : QFP-176
- CMOS 0.18 µm technology
- Power supply range 3 V to 5 V (1.8 V internal logic provided by a step-down voltage converter)
- Operating temperature range: between − 40°C and + 125°C

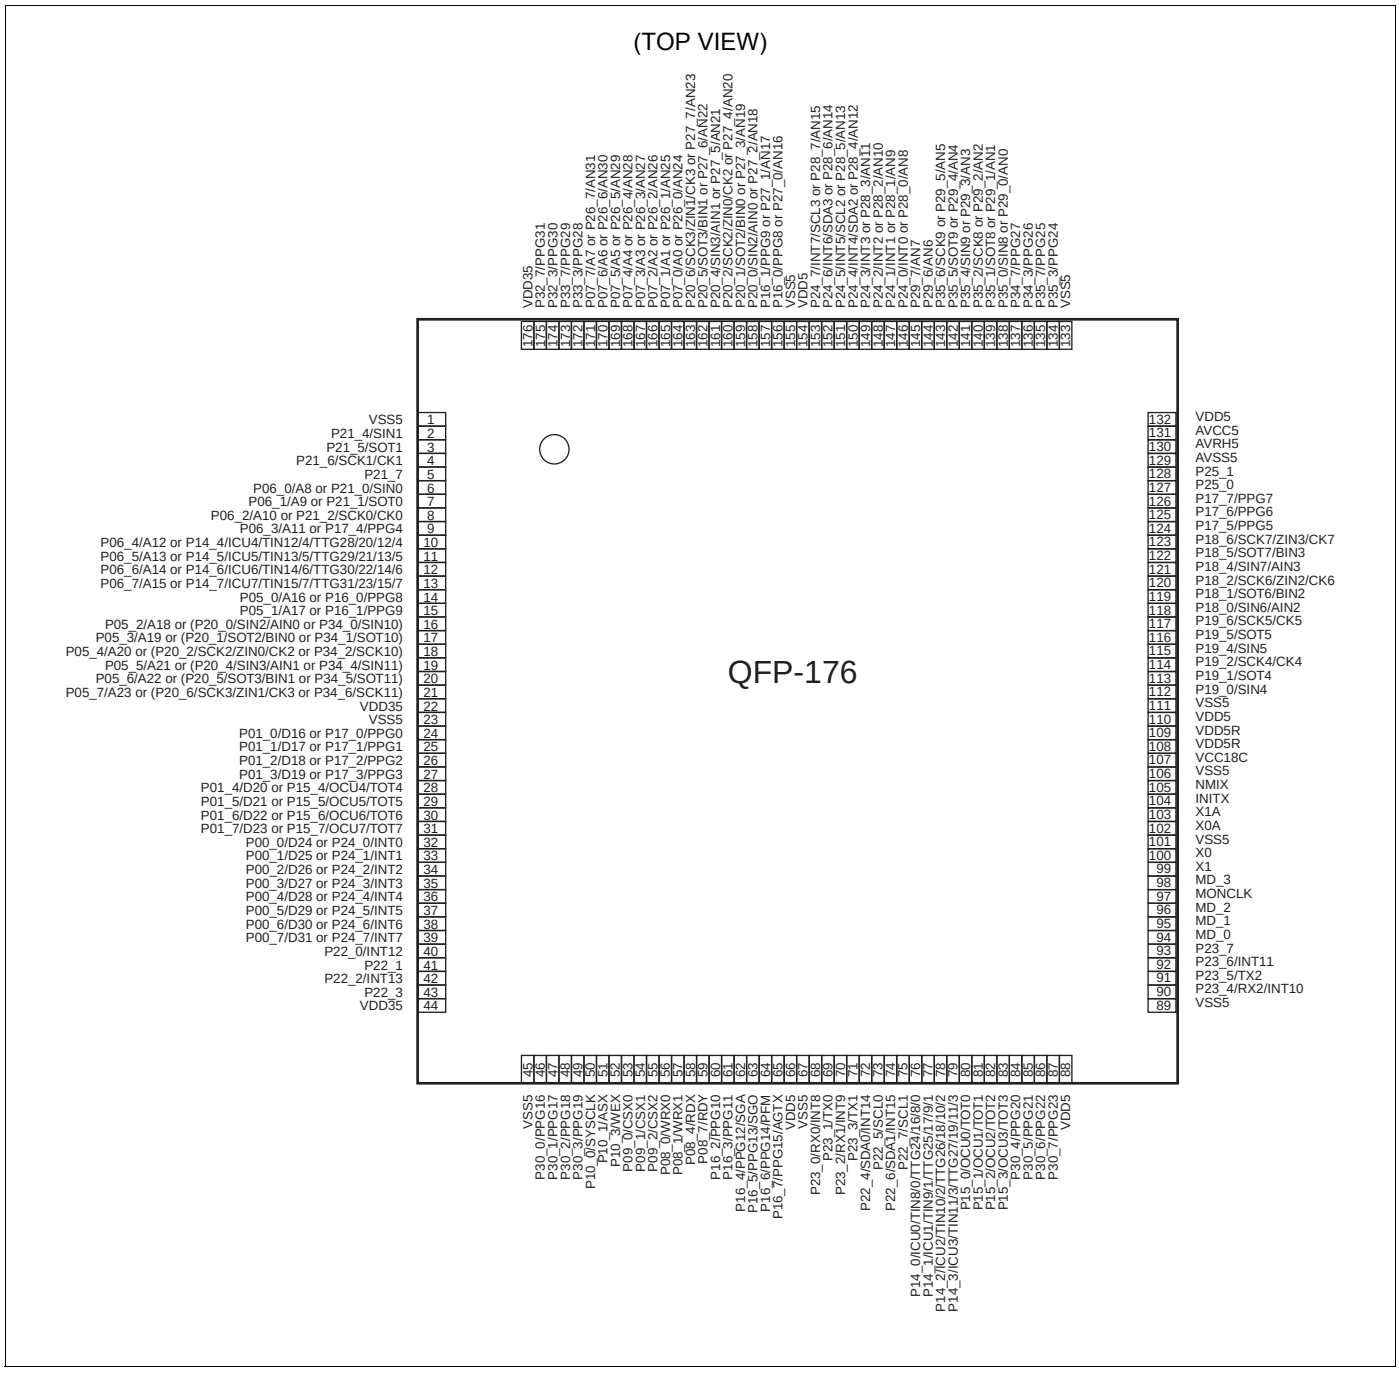
Regulator	yes	yes	yes	yes
Power consumption	n.a.	n.a.	< 1.4 W	< 1.4 W
Temperature Range (Ta)	0..70 C	0..70 C	-40..125 C	-40..125 C

Feature	Emulation Devices		CY91F465PA	CY91F467PA
	CY91V460A	CY91FV460B		
Package	BGA660	BGA896	LQFP-176	LQFP-176
Power on to PLL run	< 20 ms	< 20 ms	< 20 ms	< 20 ms
Flash Download Time	n.a.	< 8 sec. typical	< 5 sec. typical	< 6 sec. typical

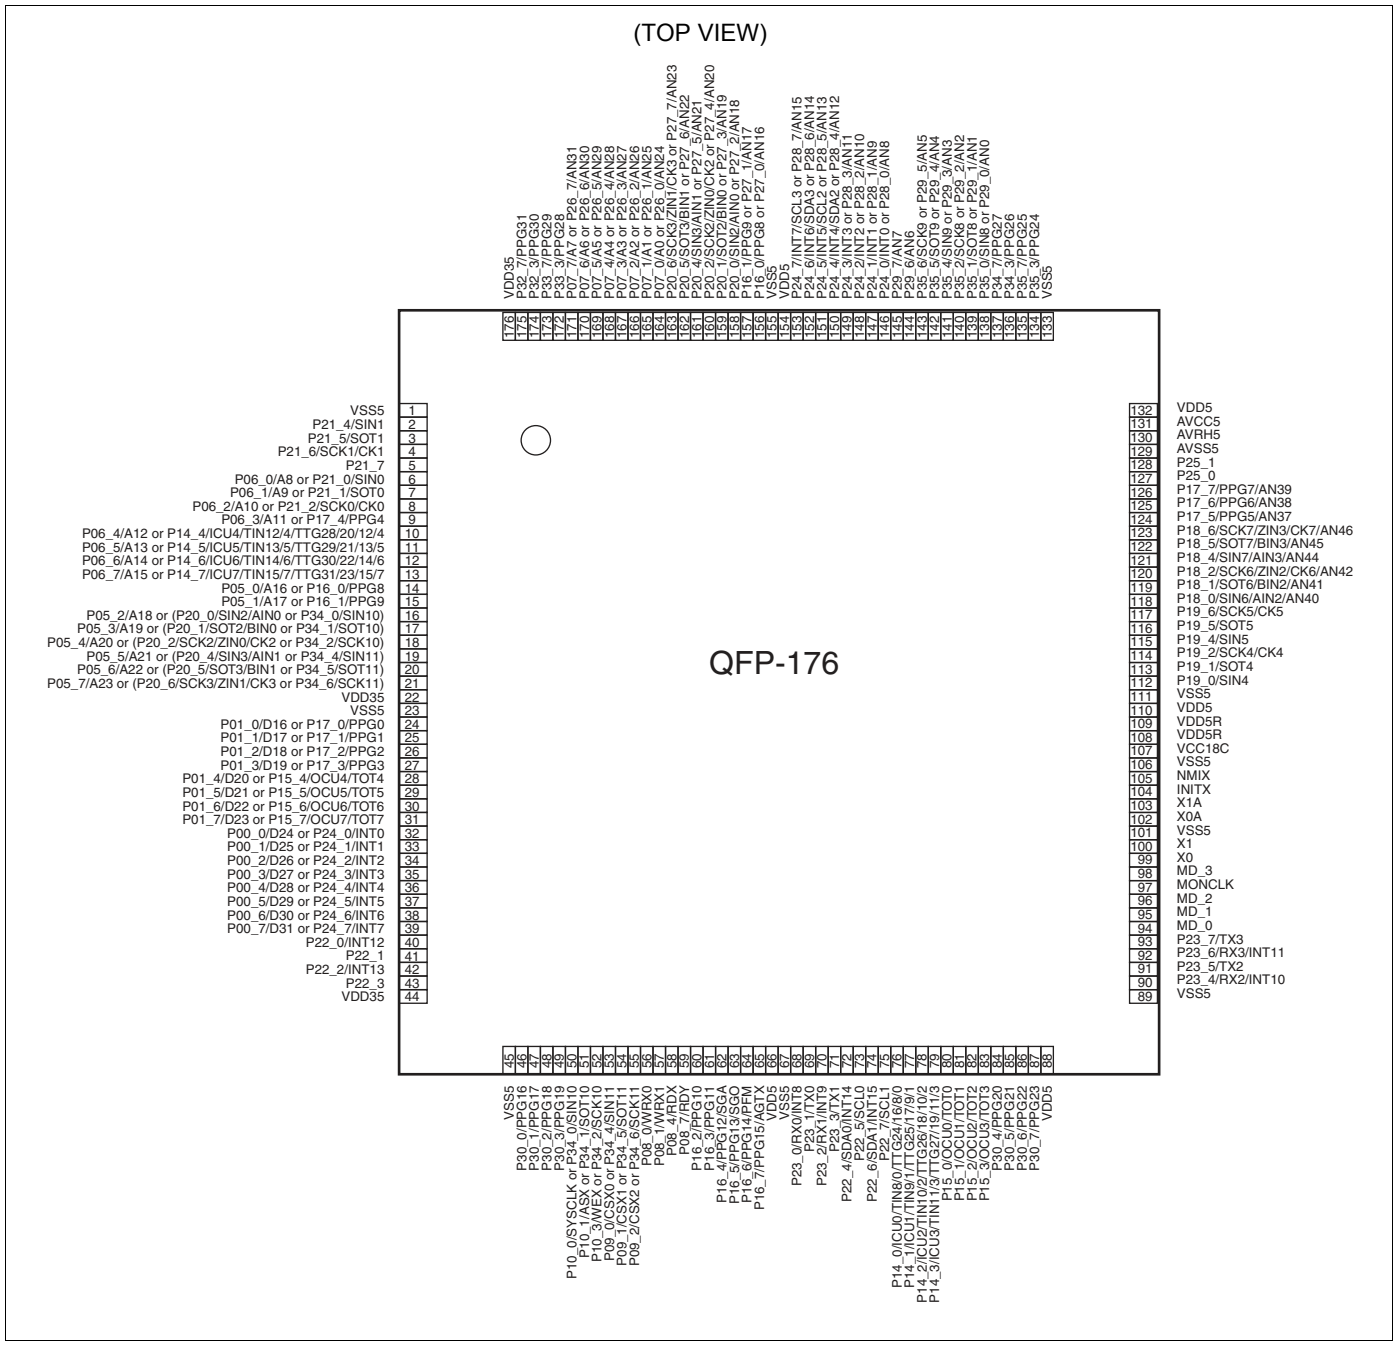
*1: MPU channels use EDSU breakpoint registers (shared operation between MPU and EDSU).
*2: Maximum channel count is shown; function is multiplexed with external bus addresses.

2. Pin Assignment

2.1 CY91F465PA



2.2 CY91F467PA



The pinout of CY91F467PA differs versus CY91F465PA at the following pins:

- Pins 50-55: Added re-located LIN-USART10/11
- Pins 92-93: Added CAN3 RX3,TX3
- Pins 118-126: Added ADC channels AN37-42, AN44-46
- Pins 99-100: X0/X1 are mirrored

3. Pin Description

3.1 CY91F465PA, CY91F467PA

Pin no.	Pin name	I/O	I/O circuit type*1	Mux	Function
2	P21_4	I/O	A	—	General-purpose input/output port
	SIN1				Data input pin of USART1
3	P21_5	I/O	A	—	General-purpose input/output port
	SOT1				Data output pin of USART1
4	P21_6	I/O	A	—	General-purpose input/output port
	SCK1				Clock input/output pin of USART1
	CK1				External clock input pin of free-run timer 1
5	P21_7	I/O	A	—	General-purpose input/output port
6	P06_0	I/O	A	PPMUX.PS4=0	General-purpose input/output port
	A8				Signal pin of external address bus (bit8)
	OR				
	P21_0	I/O	A	PPMUX.PS4=1	General-purpose input/output port
	SIN0				Data input pin of USART0
7	P06_1	I/O	A	PPMUX.PS4=0	General-purpose input/output port
	A9				Signal pin of external address bus (bit9)
	OR				
	P21_1	I/O	A	PPMUX.PS4=1	General-purpose input/output port
	SOT0				Data output pin of USART0
8	P06_2	I/O	A	PPMUX.PS4=0	General-purpose input/output port
	A10				Signal pin of external address bus (bit10)
	OR				
	P21_2	I/O	A	PPMUX.PS4=1	General-purpose input/output port
	SCK0				Clock input/output pin of USART0
	CK0				External clock input pin of free-run timer 0
9	P06_3	I/O	A	PPMUX.PS4=0	General-purpose input/output port
	A11				Signal pin of external address bus (bit11)
	OR				
	P17_4	I/O	A	PPMUX.PS4=1	General-purpose input/output port
	PPG4				Output pin of PPG timer

Pin no.	Pin name	I/O	I/O circuit type*1	Mux	Function
10 to 13	P06_4 to P06_7	I/O	A	PPMUX.PS4=0	General-purpose input/output ports
	A12 to A15				Signal pins of external address bus (bit12 to bit15)
	OR				
	P14_4 to P14_7	I/O	A	PPMUX.PS4=1	General-purpose input/output ports
	ICU4 to ICU7				Input capture input pins
	TIN12/4 to TIN15/7				External trigger input pins of reload timer
	TTG28/20/12/4 to TTG31/23/15/7				External trigger input pins of PPG timer
14	P05_0	I/O	A	PPMUX.PR10=0	General-purpose input/output port
	A16				Signal pin of external address bus (bit16 to bit17)
	OR				
	P16_0	I/O	A	PPMUX.PR10=1	General-purpose input/output port
	PPG8				Output pin of PPG timer
15	P05_1	I/O	A	PPMUX.PR11=0	General-purpose input/output port
	A17				Signal pin of external address bus (bit16 to bit17)
	OR				
	P16_1	I/O	A	PPMUX.PR11=1	General-purpose input/output port
	PPG9				Output pin of PPG timer
16	P05_2	I/O	A	PPMUX.PR12=0	General-purpose input/output port
	A18				Signal pin of external address bus (bit18)
	OR				
	P20_0	I/O	A	PPMUX.PR12=1 and PPMUX.PRPS0=1	General-purpose input/output port
	SIN2				Data input pin of USART2
	AIN0				Up/down counter input pin
	OR				
	P34_0	I/O	A	PPMUX.PR12=1 and PPMUX.PRPS0=0	General-purpose input/output port
	SIN10				Data input pin of USART10
17	P05_3	I/O	A	PPMUX.PR13=0	General-purpose input/output port
	A19				Signal pin of external address bus (bit19)
	OR				
	P20_1	I/O	A	PPMUX.PR13=1 and PPMUX.PRPS0=1	General-purpose input/output port
	SOT2				Data output pin of USART2
	BIN0				Up/down counter input pin
	OR				
	P34_1	I/O	A	PPMUX.PR13=1 and PPMUX.PRPS0=0	General-purpose input/output port
	SOT10				Data output pin of USART10

Pin no.	Pin name	I/O	I/O circuit type*1	Mux	Function
18	P05_4	I/O	A	PPMUX.PR14=0	General-purpose input/output port
	A20				Signal pin of external address bus (bit20)
	OR				
	P20_2	I/O	A	PPMUX.PR14=1 and PPMUX.PRPS0=1	General-purpose input/output port
	SCK2				Clock input/output pin of USART2
	ZIN0				Up/down counter input pin
	CK2				External clock input pin of free-run timer 2
	OR				
	P34_2	I/O	A	PPMUX.PR14=1 and PPMUX.PRPS0=0	General-purpose input/output port
	SCK10				Clock input/output pin of USART10
19	P05_5	I/O	A	PPMUX.PR15=0	General-purpose input/output port
	A21				Signal pin of external address bus (bit21)
	OR				
	P20_4	I/O	A	PPMUX.PR15=1 and PPMUX.PRPS0=1	General-purpose input/output port
	SIN3				Data input pin of USART3
	AIN1				Up/down counter input pin
	OR				
	P34_4	I/O	A	PPMUX.PR15=1 and PPMUX.PRPS0=0	General-purpose input/output port
	SIN11				Data input pin of USART11
20	P05_6	I/O	A	PPMUX.PR16=0	General-purpose input/output port
	A22				Signal pin of external address bus (bit22)
	OR				
	P20_5	I/O	A	PPMUX.PR16=1 and PPMUX.PRPS0=1	General-purpose input/output port
	SOT3				Data output pin of USART3
	BIN1				Up/down counter input pin
	OR				
	P34_5	I/O	A	PPMUX.PR16=1 and PPMUX.PRPS0=0	General-purpose input/output port
	SOT11				Data output pin of USART11
21	P05_7	I/O	A	PPMUX.PR17=0	General-purpose input/output port
	A23				Signal pin of external address bus (bit23)
	OR				
	P20_6	I/O	A	PPMUX.PR17=1 and PPMUX.PRPS0=1	General-purpose input/output port
	SCK3				Clock input/output pin of USART3
	ZIN1				Up/down counter input pin
	CK3				External clock input pin of free-run timer 3
	OR				
	P34_6	I/O	A	PPMUX.PR17=1 and PPMUX.PRPS0=0	General-purpose input/output port
	SCK11				Clock input/output pin of USART11

Pin no.	Pin name	I/O	I/O circuit type*1	Mux	Function
24 to 27	P01_0 to P01_3	I/O	A	PPMUX.PS3=0	General-purpose input/output ports
	D16 to D19				Signal pins of external data bus (bit16 to bit19)
	OR				
	P17_0 to P17_3	I/O	A	PPMUX.PS3=1	General-purpose input/output ports
	PPG0 to PPG3				Output pins of PPG timer
28 to 31	P01_4 to P01_7	I/O	A	PPMUX.PS3=0	General-purpose input/output ports
	D20 to D23				Signal pins of external data bus (bit20 to bit23)
	OR				
	P15_4 to P15_7	I/O	A	PPMUX.PS3=1	General-purpose input/output ports
	OCU4 to OCU7				Output compare output pins
	TOT4 to TOT7				Reload timer output pins
32 to 39	P00_0 to P00_7	I/O	A	PPMUX.PR0=0	General-purpose input/output ports
	D24 to D31				Signal pins of external data bus (bit24 to bit31)
	OR				
	P24_0 to P24_7	I/O	A	PPMUX.PR0=1	General-purpose input/output ports
	INT0 to INT7				External interrupt input pins
40	P22_0	I/O	A	—	General-purpose input/output port
	INT12				External interrupt input pin
41	P22_1	I/O	A	—	General-purpose input/output port
42	P22_2	I/O	A	—	General-purpose input/output port
	INT13				External interrupt input pin
43	P22_3	I/O	A	—	General-purpose input/output port
46 to 49	P30_0 to P30_3	I/O	A	—	General-purpose input/output ports
	PPG16 to PPG19				Output pins of PPG timer
50	P10_0	I/O	A	—	General-purpose input/output port
	SYSCLK				External bus clock output pin
	OR (CY91F467PA only)				
	P34_0	I/O	A	PPMUX2.PR0=1	General-purpose input/output port
	SIN10				Data input pin of USART10
51	P10_1	I/O	A	—	General-purpose input/output port
	ASX				Address strobe output pin
	OR (CY91F467PA only)				
	P34_1	I/O	A	PPMUX2.PR1=1	General-purpose input/output port
	SOT10				Data output pin of USART10
52	P10_3	I/O	A	—	General-purpose input/output port
	WEX				Write enable output pin
	OR (CY91F467PA only)				
	P34_2	I/O	A	PPMUX2.PR2=1	General-purpose input/output port
	SCK10				Clock input/output pin of USART10

Pin no.	Pin name	I/O	I/O circuit type*1	Mux	Function
53	P09_0	I/O	A	—	General-purpose input/output port
	CSX0				Chip select output pin
	OR (CY91F467PA only)				
	P34_4	I/O	A	PPMUX2.PR3=1	General-purpose input/output port
	SIN11				Data input pin of USART11
54	P09_1	I/O	A	—	General-purpose input/output port
	CSX1				Chip select output pin
	OR (CY91F467PA only)				
	P34_5	I/O	A	PPMUX2.PR4=1	General-purpose input/output port
	SOT11				Data output pin of USART11
55	P09_2	I/O	A	—	General-purpose input/output port
	CSX2				Chip select output pin
	OR (CY91F467PA only)				
	P34_6	I/O	A	PPMUX2.PR5=1	General-purpose input/output port
	SCK11				Clock input/output pin of USART11
56, 57	P08_0, P08_1	I/O	A	—	General-purpose input/output ports
	WRX0, WRX1				External write strobe output pins
58	P08_4	I/O	A	—	General-purpose input/output port
	RDX				External read strobe output pin
59	P08_7	I/O	A	—	General-purpose input/output port
	RDY				External ready input pin
60, 61	P16_2, P16_3	I/O	A	—	General-purpose input/output ports
	PPG10, PPG11				Output pins of PPG timer
62	P16_4	I/O	A	—	General-purpose input/output port
	PPG12				Output pin of PPG timer
	SGA				SGA output pin of sound generator
63	P16_5	I/O	A	—	General-purpose input/output port
	PPG13				Output pin of PPG timer
	SGO				SGO output pin of sound generator
64	P16_6	I/O	A	—	General-purpose input/output port
	PPG14				Output pin of PPG timer
	PFM				Pulse frequency modulator output pin
65	P16_7	I/O	A	—	General-purpose input/output port
	PPG15				Output pin of PPG timer
	ATGX				A/D converter external trigger input pin
68	P23_0	I/O	A	—	General-purpose input/output port
	RX0				RX input pin of CAN0
	INT8				External interrupt input pin
69	P23_1	I/O	A	—	General-purpose input/output port
	TX0				TX output pin of CAN0

Pin no.	Pin name	I/O	I/O circuit type*1	Mux	Function
70	P23_2	I/O	A	—	General-purpose input/output port
	RX1				RX input pin of CAN1
	INT9				External interrupt input pin
71	P23_3	I/O	A	—	General-purpose input/output port
	TX1				TX output pin of CAN1
72	P22_4	I/O	C	—	General-purpose input/output port
	SDA0				I^2C bus DATA input/output pin (open drain)
	INT14				External interrupt input pin
73	P22_5	I/O	C	—	General-purpose input/output port
	SCL0				I^2C bus clock input/output pin (open drain)
74	P22_6	I/O	C	—	General-purpose input/output port
	SDA1				I^2C bus DATA input/output pin (open drain)
	INT15				External interrupt input pin
75	P22_7	I/O	C	—	General-purpose input/output port
	SCL1				I^2C bus clock input/output pin (open drain)
76 to 79	P14_0 to P14_3	I/O	A	—	General-purpose input/output ports
	ICU0 to ICU3				Input capture input pins
	TIN8/0 to TIN11/3				External trigger input pins of reload timer
	TTG24/16/8/0 to TTG27/19/11/3				External trigger input pins of PPG timer
80 to 83	P15_0 to P15_3	I/O	A	—	General-purpose input/output ports
	OCU0 to OCU3				Output compare output pins
	TOT0 to TOT3				Reload timer output pins
84 to 87	P30_4 to P30_7	I/O	A	—	General-purpose input/output ports
	PPG20 to PPG23				Output pins of PPG timer
90	P23_4	I/O	A	—	General-purpose input/output port
	RX2				RX input pin of CAN2
	INT10				External interrupt input pin
91	P23_5	I/O	A	—	General-purpose input/output port
	TX2				TX output pin of CAN2
92	P23_6	I/O	A	—	General-purpose input/output ports
	RX3				RX input pin of CAN3 *4
	INT11				External interrupt input pin
93	P23_7	I/O	A	—	General-purpose input/output port
	TX3				TX output pin of CAN3 *4
94	MD_0	I	G	—	Mode setting pin
95	MD_1	I	G	—	Mode setting pin
96	MD_2	I	G	—	Mode setting pin
97	MONCLK	O	M	—	Clock Monitor pin
98	MD_3	I	G	—	Fast clock input pin

Pin no.	Pin name	I/O	I/O circuit type*1	Mux	Function
99	X1	—	J1	—	Clock (oscillation) output, F465PA
	X0				Clock (oscillation) input, F467PA

	PPG31				Output pin of PPG timer

*1: For information about the I/O circuit type, refer to “4. I/O Circuit Types”.
*2: CY91F465PA has type A, CY91F467PA has type B
*3: A/D converter channels 37-42, 44-46 only available on CY91F467PA.
*4: CAN3 only available on CY91F467PA.

[Power supply/Ground pins]

Pin no.	Pin name	I/O	Function
1, 23, 45, 67, 89, 101, 106, 111, 133, 155	VSS5	Supply	Ground pins
66, 88, 110, 132, 154	VDD5		Power supply pins
108, 109	VDD5R		Power supply pins for internal regulator
129	AVSS5		Analog ground pin for A/D converter
131	AVCC5		Power supply pin for A/D converter
130	AVRH5		Reference power supply pin for A/D converter
107	VCC18C		Capacitor connection pin for internal regulator
22, 44, 176	VDD35		Power supply pins for external bus part of I/O ring

4. I/O Circuit Types

Type	Circuit	Remarks
A		CMOS level output (programmable I_{OL} = 5mA, I_{OH} = -5mA and I_{OL} = 2mA, I_{OH} = -2mA) 2 different CMOS hysteresis inputs with input shutdown function Automotive input with input shutdown function TTL input with input shutdown function Programmable pull-up resistor: 50kΩ approx.
B		CMOS level output (programmable I_{OL} = 5mA, I_{OH} = -5mA and I_{OL} = 2mA, I_{OH} = -2mA) 2 different CMOS hysteresis inputs with input shutdown function Automotive input with input shutdown function TTL input with input shutdown function Programmable pull-up resistor: 50kΩ approx. Analog input

Type	Circuit	Remarks
C		CMOS level output (I_{OL} = 3mA, I_{OH} = -3mA) 2 different CMOS hysteresis inputs with input shutdown function Automotive input with input shutdown function TTL input with input shutdown function Programmable pull-up resistor: 50kΩ approx.
D		CMOS level output (I_{OL} = 3mA, I_{OH} = -3mA) 2 different CMOS hysteresis inputs with input shutdown function Automotive input with input shutdown function TTL input with input shutdown function Programmable pull-up resistor: 50kΩ approx. Analog input

Type	Circuit	Remarks
E		CMOS level output (programmable I_{OL} = 5mA, I_{OH} = -5mA and I_{OL} = 2mA, I_{OH} = -2mA, and I_{OL} = 30mA, I_{OH} = -30mA) 2 different CMOS hysteresis inputs with input shutdown function Automotive input with input shutdown function TTL input with input shutdown function Programmable pull-up resistor: 50kΩ approx.
F		CMOS level output (programmable I_{OL} = 5mA, I_{OH} = -5mA and I_{OL} = 2mA, I_{OH} = -2mA, and I_{OL} = 30mA, I_{OH} = -30mA) 2 different CMOS hysteresis inputs with input shutdown function Automotive input with input shutdown function TTL input with input shutdown function Programmable pull-up resistor: 50kΩ approx. Analog input

Type	Circuit	Remarks
G		Mask ROM and EVA device: CMOS Hysteresis input pin Flash device: CMOS input pin 12 V withstand (for MD [2:0])
H		CMOS Hysteresis input pin Pull-up resistor value: 50 kΩ approx.
J1		High-speed oscillation circuit: • Programmable between oscillation mode (external crystal or resonator connected to X0/X1 pins) and Fast external Clock Input (FCI) mode (external clock connected to X0 pin) • Feedback resistor = approx. 2 * 0.5 MΩ. Feedback resistor is grounded in the center when the oscillator is disabled or in FCI mode.
J2		Low-speed oscillation circuit: • Feedback resistor = approx. 2 * 5 MΩ. Feedback resistor is grounded in the center when the oscillator is disabled.

Type	Circuit	Remarks
K		CMOS level output (programmable I_{OL} = 5mA, I_{OH} = -5mA and I_{OL} = 2mA, I_{OH} = -2mA) 2 different CMOS hysteresis inputs with input shutdown function Automotive input with input shutdown function TTL input with input shutdown function Programmable pull-up resistor: 50kΩ approx. LCD SEG/COM output
L		CMOS level output (programmable I_{OL} = 5mA, I_{OH} = -5mA and I_{OL} = 2mA, I_{OH} = -2mA) 2 different CMOS hysteresis inputs with input shutdown function Automotive input with input shutdown function) TTL input with input shutdown function Programmable pull-up resistor: 50kΩ approx. Analog input LCD Voltage input

Type	Circuit	Remarks
M		CMOS level tri-state output (I_{OL} = 5mA, I_{OH} = -5mA)
N		Analog input pin with protection

5. Port Multiplexing

5.1 PPMUX Register

CY91460P series uses port multiplexing. This means that there are more implemented resources than actual pins. Which ports/ resources are multiplexed to which pin depends on the PPMUX register setting.

	15	14	13	12	11	10	9	8
0x049A	PR17	PR16	PR15	PR14	PR13	PR12	PR11	PR10

	7	6	5	4	3	2	1	0
0x049B	PRPS0	PR0	PS5	PS4	PS3	PS2	PS1	PS0

The PPMUX register can only be written as a half-word. It is writable only once.
The PPMUX register is reset by INIT or by a soft reset (the initial value is 0x0000 then).

Note: Port relocation (via PRx) always has higher priority than Port Switching (via PSx).

5.2 PPMUX2 Register (CY91F467PA)

CY91F467PA has a second port multiplexing register, PPMUX2, for multiplexing of LIN-USART10,11.
The settings of PPMUX2 have priority over the settings of PPMUX.

	15	14	13	12	11	10	9	8
0x049C	-	-	PR5	PR4	PR3	PR2	PR1	PR0

	7	6	5	4	3	2	1	0
0x049D	-	-	-	-	-	-	-	-

The PPMUX2 register can only be written as a half-word. It is writable only once.
The PPMUX2 register is reset by INIT or by a soft reset (the initial value is 0x00 then).

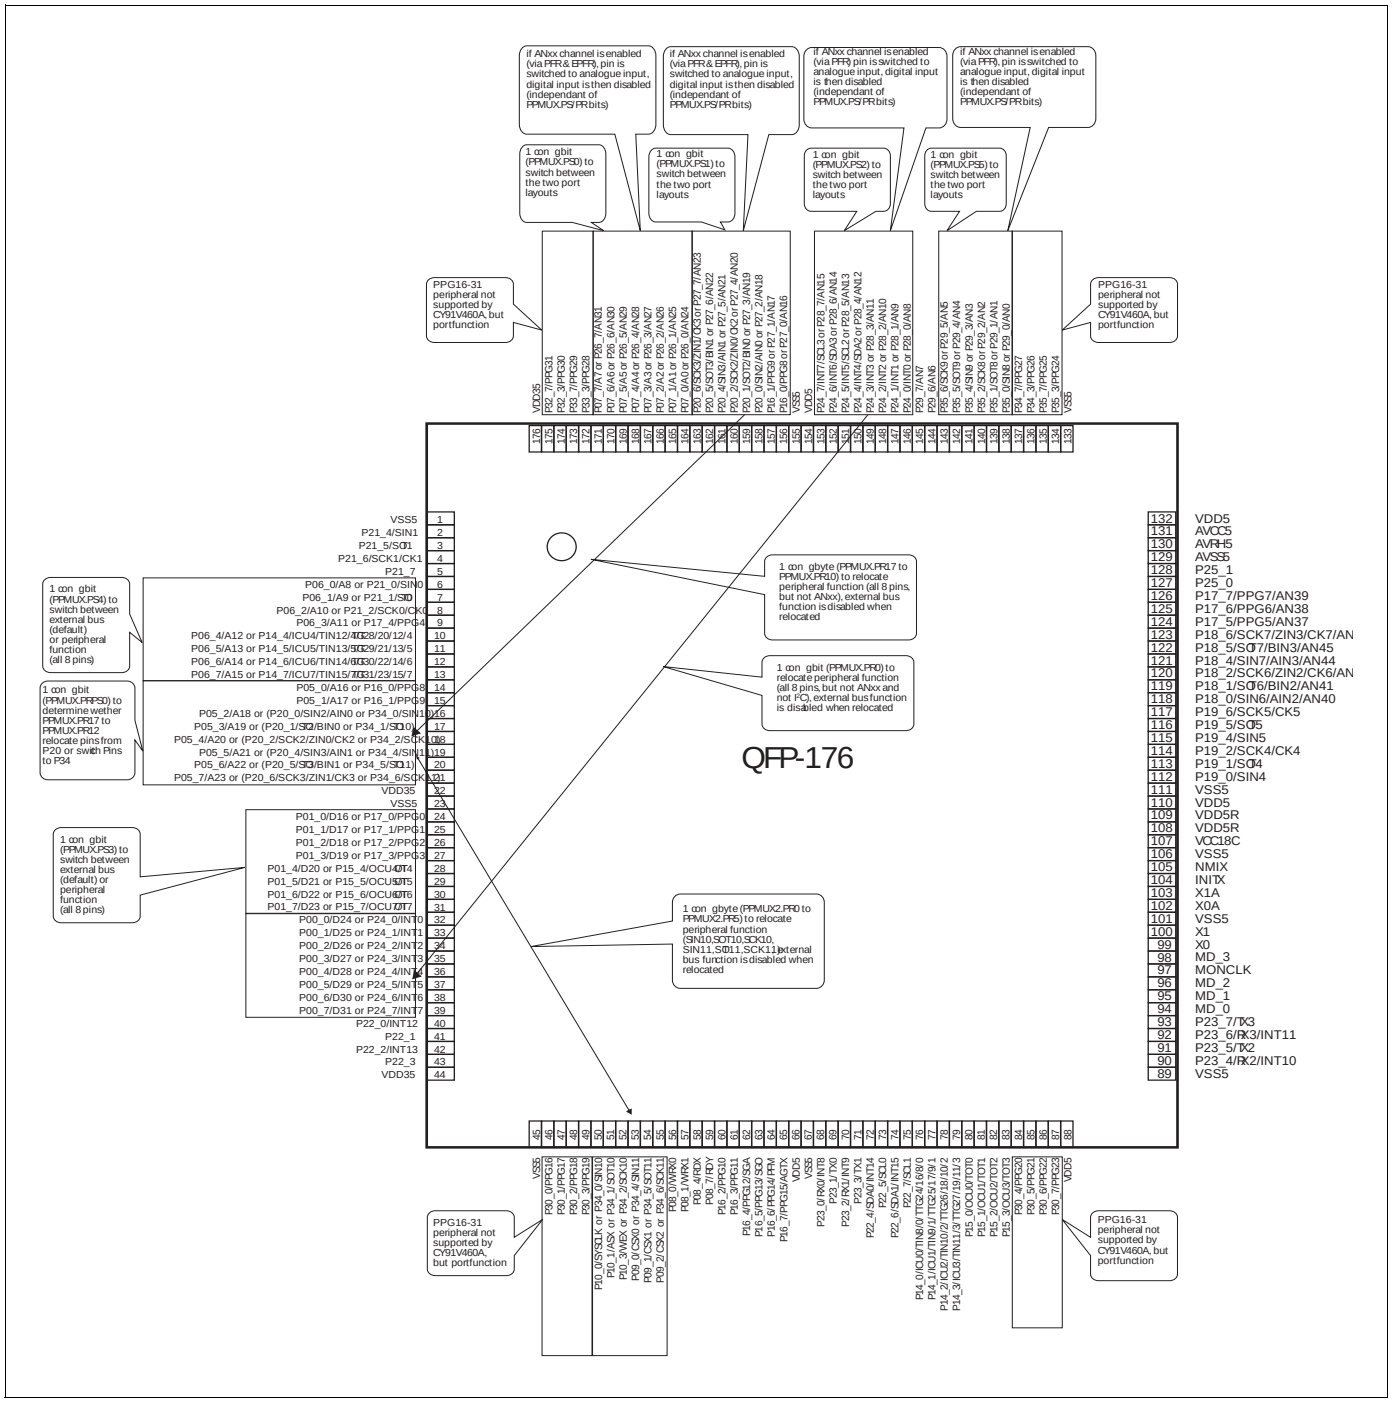
5.4 Multiplex Pinout CY91F467PA



6. Reload Timer / New Features

6.1 Overview

The reload timer uses a 16 bit down counter to detect the input signal trigger and perform a count down.
The count length is 16 bits.

6.2 Features

Format: 16 bit down counter with reload register
Quantity: 16 (Output: 8 channels TOT[0 to 7])

Cascading clock mode: (only available for Reload timers 8,10,12,14)

- Count clock for Reload timer 8: Output of Reload timer 9
- Count clock for Reload timer 10: Output of Reload timer 11
- Count clock for Reload timer 12: Output of Reload timer 13
- Count clock for Reload timer 14: Output of Reload timer 15

Count active edge: When in external event mode, choose from 3 types.

- External trigger (rising /falling/both edges)
  Interrupt: Request generated by underflow
  Other 1: Counter stop in software/can be reopened
  Other 2: Control of other peripheral functions possible
- PPG activation trigger source:
  Reload timer 8 : PPG16, PPG17
  Reload timer 9 : PPG18, PPG19
  Reload timer 10 : PPG20, PPG21
  Reload timer 11 : PPG22, PPG23
  Reload timer 12 : PPG24, PPG25
  Reload timer 13 : PPG26, PPG27
  Reload timer 14 : PPG28, PPG29
  Reload timer 15 : PPG30, PPG31
- A/D converter activation trigger source (Reload timer 7 : A/D)

6.3 Registers

6.3.1 TMCSR: Reload Timer Control Status Register

The control status register controls the operation mode of the reload timer and interrupts.

- TMCSR8 (Reload timer 8): Address: 00596H (Access: Byte, Half-word)
- TMCSR9 (Reload timer 9): Address: 0059EEH (Access: Byte, Half-word)
- TMCSR10 (Reload timer 10): Address: 005A6H (Access: Byte, Half-word)
- TMCSR11 (Reload timer 11): Address: 005AEH (Access: Byte, Half-word)
- TMCSR12 (Reload timer 12): Address: 005B6H (Access: Byte, Half-word)
- TMCSR13 (Reload timer 13): Address: 005BEH (Access: Byte, Half-word)
- TMCSR14 (Reload timer 14): Address: 005C6H (Access: Byte, Half-word)
- TMCSR15 (Reload timer 15): Address: 005CEH (Access: Byte, Half-word)

15	14	13	12	11	10	9	8	bit
			CSL2	CSL1	CSL0	MOD2	MOD1	
-	-	-	0	0	0	0	0	Initial Value
RX/WX	RX/WX	RX/WX	R/W	R/W	R/W	R/W0	R/W	Attribute
								Rewrite during operation

7	6	5	4	3	2	1	0	bit
MOD0		OULT	RELD	INTE	UF	CNTE	TRG	
0	-	0	0	0	0	0	0	Initial Value
R/W	RX/WX	R/W	R/W	R/W	R(RM1),W	R/W	R0/W	Attribute
					O	O	O	Rewrite during operation

(O: can be rewritten, x: cannot be rewritten)

bit12-10: Count clock selection **CLKP: peripheral clock**

CSL2	CSL1	CSL0	Count clock	Remarks
0	0	0	Internal clock CLKP/2	
0	0	1	Internal clock CLKP/8	
0	1	0	Internal clock CLKP/32	
0	1	1	External event (external clock)	
1	0	1	Internal clock CLKP/64	
1	1	0	Internal clock CLKP/128	
1	1	1	RLT n+1 output	only allowed for RLT 8, 10, 12, 14

6.3.2 TMR: Timer Register

- TMR8 (Reload timer 8): Address: 0592H (Access: Half-word)
- TMR9 (Reload timer 9): Address: 059AH (Access: Half-word)
- TMR10 (Reload timer 10): Address: 05A2H (Access: Half-word)
- TMR11 (Reload timer 11): Address: 05AAH (Access: Half-word)
- TMR12 (Reload timer 12): Address: 05B2H (Access: Half-word)
- TMR13 (Reload timer 13): Address: 05BAH (Access: Half-word)
- TMR14 (Reload timer 14): Address: 05C2H (Access: Half-word)
- TMR15 (Reload timer 15): Address: 05CAH (Access: Half-word)

6.3.3 TMRC: Consistent Timer Register

- TMR89 (Reload timer 8, 9): Address: 05D0H (Access: Word)
- TMR1011 (Reload timer 10, 11): Address: 05D4H (Access: Word)
- TMR1213 (Reload timer 12, 13): Address: 05D8H (Access: Word)
- TMR1415 (Reload timer 14, 15): Address: 05DCH (Access: Word)

31	30	29	28	27	26	25	24	bit

R/WX	R/WX	R/WX	R/WX	R/WX	R/WX	R/WX	R/WX	Attribute

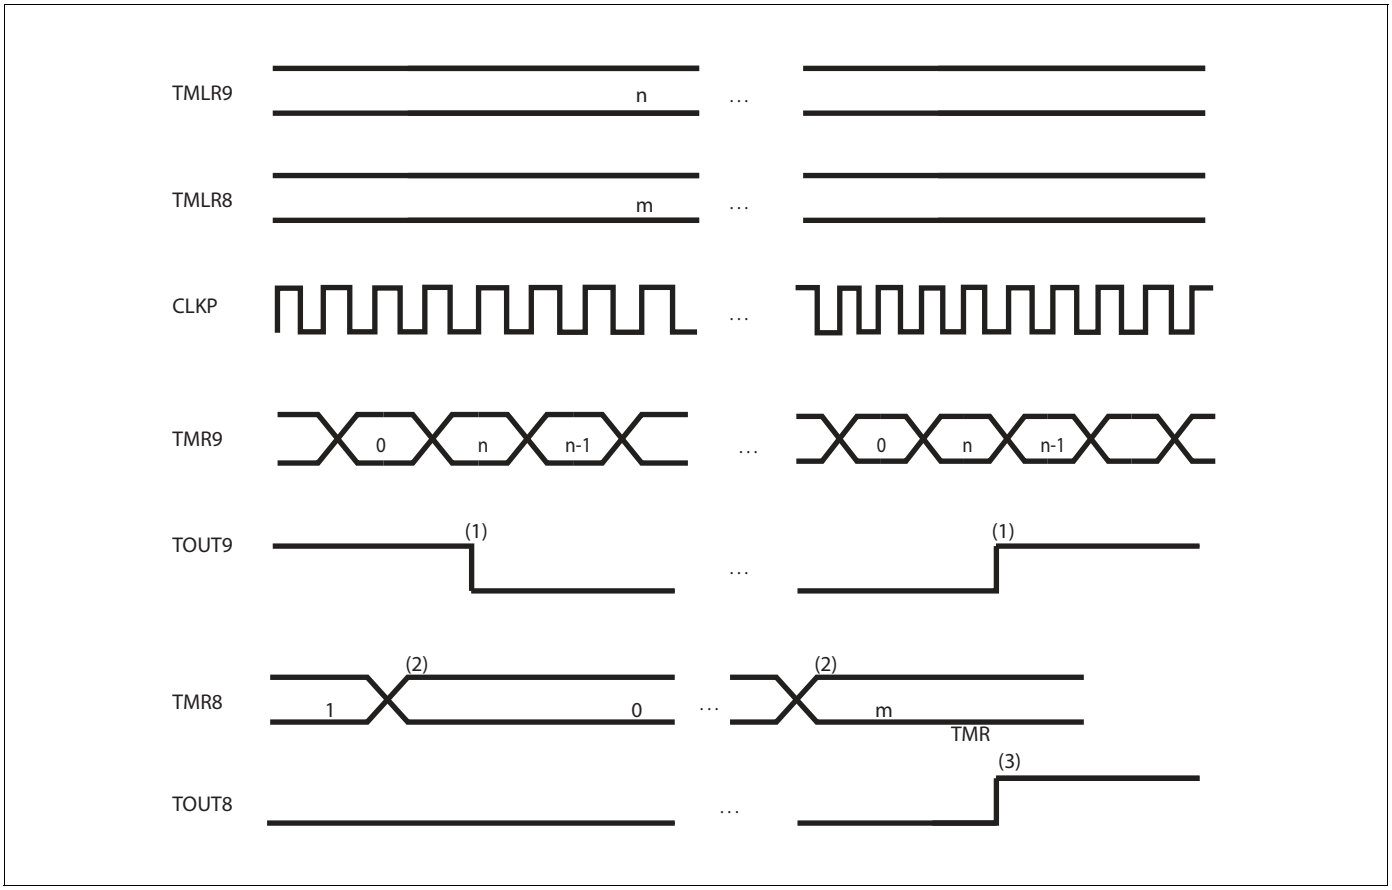
The count values of cascaded reload timers can be read out through the timer register TMRC at the same time. Upper halfword contain TMRn, lower halfword TMRn+1.
Please perform the read out using word access.

6.3.4 TMRLR: Reload register

- TMRLR8 (Reload timer 8): Address: 0590H (Access: Half-word)
- TMRLR9 (Reload timer 9): Address: 0598H (Access: Half-word)
- TMRLR10 (Reload timer 10): Address: 05A0H (Access: Half-word)
- TMRLR11 (Reload timer 11): Address: 05A8H (Access: Half-word)
- TMRLR12 (Reload timer 12): Address: 05B0H (Access: Half-word)
- TMRLR13 (Reload timer 13): Address: 05B8H (Access: Half-word)
- TMRLR14 (Reload timer 14): Address: 05C0H (Access: Half-word)
- TMRLR15 (Reload timer 15): Address: 05C8H (Access: Half-word)

6.4 Cascading Operation

In reload mode Reload timer 9 Output is set as Count event for Reload timer 8, both edge modes.



(1) TOUT9 signal change caused by underflow TMR9
(2) TMR8 decreased by TOUT9
(3) TOUT8 signal change caused by underflow of TMR8

7. Additional PPGs

7.1 Register

7.1.1 PCSR: PPG Cycle Setting Register

Controls the cycle of the PPG.

- PCSR16 (PPG16): Address 0512h (Access: Half-word)
- PCSR17 (PPG17): Address 0518h (Access: Half-word)
- PCSR18 (PPG18): Address 0522h (Access: Half-word)
- PCSR19 (PPG19): Address 0528h (Access: Half-word)
- PCSR20 (PPG20): Address 0532h (Access: Half-word)
- PCSR21 (PPG21): Address 0538h (Access: Half-word)
- PCSR22 (PPG22): Address 0542h (Access: Half-word)
- PCSR23 (PPG23): Address 0548h (Access: Half-word)
- PCSR24 (PPG24): Address 0552h (Access: Half-word)
- PCSR25 (PPG25): Address 0558h (Access: Half-word)
- PCSR26 (PPG26): Address 0562h (Access: Half-word)
- PCSR27 (PPG27): Address 0568h (Access: Half-word)
- PCSR28 (PPG28): Address 0572h (Access: Half-word)
- PCSR29 (PPG29): Address 0578h (Access: Half-word)
- PCSR30 (PPG30): Address 0582h (Access: Half-word)
- PCSR31 (PPG31): Address 0588h (Access: Half-word)

7.1.2 PDUT: PPG Duty Setting Register

Sets the duty of the PPG output waveform.

- PDUT16 (PPG16): Address 0514h (Access: Half-word)
- PDUT17 (PPG17): Address 051Ch (Access: Half-word)
- PDUT18 (PPG18): Address 0524h (Access: Half-word)
- PDUT19 (PPG19): Address 052Ch (Access: Half-word)
- PDUT20 (PPG20): Address 0534h (Access: Half-word)
- PDUT21 (PPG21): Address 053Ch (Access: Half-word)
- PDUT22 (PPG22): Address 0544h (Access: Half-word)
- PDUT23 (PPG23): Address 054Ch (Access: Half-word)
- PDUT24 (PPG24): Address 0554h (Access: Half-word)
- PDUT25 (PPG25): Address 055Ch (Access: Half-word)
- PDUT26 (PPG26): Address 0564h (Access: Half-word)
- PDUT27 (PPG27): Address 056Ch (Access: Half-word)
- PDUT28 (PPG28): Address 0574h (Access: Half-word)
- PDUT29 (PPG29): Address 057Ch (Access: Half-word)
- PDUT30 (PPG30): Address 0584h (Access: Half-word)
- PDUT31 (PPG31): Address 058Ch (Access: Half-word)

7.1.3 PCN: PPG Control Status register

Controls the operations and status of PPGs.

- PCN16 (PPG16): Address 0516h (Access: Byte, Half-word)
- PCN17 (PPG17): Address 051Eh (Access: Byte, Half-word)
- PCN18 (PPG18): Address 0526h (Access: Byte, Half-word)
- PCN19 (PPG19): Address 052Eh (Access: Byte, Half-word)
- PCN20 (PPG20): Address 0536h (Access: Byte, Half-word)
- PCN21 (PPG21): Address 053Eh (Access: Byte, Half-word)
- PCN22 (PPG22): Address 0546h (Access: Byte, Half-word)
- PCN23 (PPG23): Address 054Eh (Access: Byte, Half-word)
- PCN24 (PPG24): Address 0556h (Access: Byte, Half-word)
- PCN25 (PPG25): Address 055Eh (Access: Byte, Half-word)
- PCN26 (PPG26): Address 0566h (Access: Byte, Half-word)
- PCN27 (PPG27): Address 056Eh (Access: Byte, Half-word)
- PCN28 (PPG28): Address 0576h (Access: Byte, Half-word)
- PCN29 (PPG29): Address 057Eh (Access: Byte, Half-word)
- PCN30 (PPG30): Address 0586h (Access: Byte, Half-word)
- PCN31 (PPG31): Address 058Eh (Access: Byte, Half-word)

7.1.4 GCN1: General Control register 1

Selects a trigger input to PPG0 PPG16-PPG19, PPG20-PPG23, PPG24-PPG27 and PPG28-PPG31.

- GCN14 (PPG16-PPG19): Address 0500h (Access: Half-word)
- GCN15 (PPG20-PPG23): Address 0504h (Access: Half-word)
- GCN16 (PPG24-PPG27): Address 0505h (Access: Half-word)
- GCN17 (PPG28-PPG31): Address 050Ch (Access: Half-word)

7.1.5 GCN2: General Control register 2

Generates PPG16-PPG19, PPG20-PPG23, PPG24-PPG27 and PPG28-PPG31 internal trigger levels using software.

- GCN24 (PPG16-PPG19): Address 0503h (Access: Byte)
- GCN25 (PPG20-PPG23): Address 0507h (Access: Byte)
- GCN26 (PPG24-PPG27): Address 050Bh (Access: Byte)
- GCN27 (PPG28-PPG31): Address 050Fh (Access: Byte)

7.1.6 PTMR: PPG Timer Register

Reads the counts of PPGs.

- PTMR16 (PPG16): Address 0510h (Access: Half-word)
- PTMR17 (PPG17): Address 0518h (Access: Half-word)
- PTMR18 (PPG18): Address 0520h (Access: Half-word)
- PTMR19 (PPG19): Address 0528h (Access: Half-word)
- PTMR20 (PPG20): Address 0530h (Access: Half-word)
- PTMR21 (PPG21): Address 0538h (Access: Half-word)
- PTMR22 (PPG22): Address 0540h (Access: Half-word)
- PTMR23 (PPG23): Address 0548h (Access: Half-word)
- PTMR24 (PPG24): Address 0550h (Access: Half-word)
- PTMR25 (PPG25): Address 0558h (Access: Half-word)
- PTMR26 (PPG26): Address 0560h (Access: Half-word)
- PTMR27 (PPG27): Address 0568h (Access: Half-word)
- PTMR28 (PPG28): Address 0570h (Access: Half-word)
- PTMR29 (PPG29): Address 0578h (Access: Half-word)
- PTMR30 (PPG30): Address 0581h (Access: Half-word)
- PTMR31 (PPG31): Address 0588h (Access: Half-word)

8. A/D Converter / New Features (CY91F467PA)

CY91F467PA has two 10-bit A/D Converter macros. The original ADC, which is available on all CY91460 series devices, is now called “ADC 0”, the second macro is called “ADC 1”.

8.1 A/D Converter Features

- Both ADC 0 and ADC 1 are 10-bit / 1 µs macros used on other CY91460 series devices.
- Both ADCs have the new digital part with separated A/D Result registers and 4-channel Range Comparator, see chapter 9.“A/D Converter / Range Comparator (CY91F467PA)”.
- Both ADCs can be triggered from Reload Timer RLT7.
- Both ADCs can be triggered from the same external ATGX pin (GP16_7).
- On CY91F467PA, ADC0 and ADC1 share the same analog power and reference supply ($AV_{CC}5$,AVRH5,AV_{SS}).

8.2 Analog Input Connections

8.2.1 Global ADC Analog Channel Enable

The global ADC channel enable feature makes the ADC analog inputs independend of PFR/EPFR settings. It was introduced for 2 reasons:

- Some new ADC channels are assigned to ports whose PFR/EPFR combinations are already used completely for other resources.
- Customers may measure digital output signals with the ADC to check for external shortages. PFR/EPFR settings for ADC always switch the digital port to HiZ mode.

The global ADC channel enable is controlled by bit ADCHE in PORTEN register:

PORTEN Register Address: 0x0498 Access: Byte

7	6	5	4	3	2	1	0	Bit
-	-	-	-	-	**ADCHE**	CPORTEN	GPORTEN	
X	X	X	X	X	0	0	0	Initial value
RX, W0	RX, W0	RX, W0	RX, W0	RX, W0	R, W	R, W	R, W	Attribute

Bit7-3: Reserved bits. Always write 0 to these bits.

Bit2: ADCHE Global A/D Channel Enable.

ADCHE	Function
0 [initial]	Global A/D Channel Enable is OFF. The ADC analog lines of channels 0-31 are enabled by setting of the ADC enable bits (ADEn) in the ADERH,ADERL register and PFR/EPFR. PFR/EPFR will set the digital output to HiZ mode and disable the digital input lines of the port.
1	Global A/D Channel Enable is ON. The ADC analog lines of channels **6-7** are enabled by setting of the ADC enable bits (ADEn) in the ADERH,ADERL register only. ADEn will disable the digital input lines of the port, but the digital outputs are not changed. For analog measurement, the user has to switch the port to input direction.

This bit is cleared by software reset (RST) and can be written and read by CPU.

Note: For new ADC channels (AN32 to AN53, device depending), the ADCHE feature is always ON.
For old ADC channels (AN0 to AN31), the ADCHE feature is always OFF if the channels are re-located to other pins. On CY91F467PA, the ADCHE feature is only available on the non-relocated ADC channels 6-7 on ports P29[6,7].

Bit1:0: CPORTEN,GPORTEN Global Port Input Enable

CPORTEN	GPORTEN	Function
0 [initial]	0 [initial]	All port input lines are disabled.
1	0	The Port Input for LIN-USART 4 is enabled. This functionality is used by the Boot ROM to establish a serial communication with Softune for flash programming.
X	1	All port input lines are enabled.

- These bits are cleared by software reset (RST) and can be written and read by CPU.
- After execution of the Boot ROM the bits are in initial state.

8.2.2 ADC 0 Analog Inputs

ADC 0 serves the analog inputs AN0 to AN31. There are 2 methods for enabling the analog inputs:

- For all channels: Set ADC channel enable bits (ADEn) in the ADERH,ADERL register and set PFR/EPFR of the attached I/O port
- For channels 6-7: Set ADC channel enable bits (ADEn) in the ADERH,ADERL register and set global ADC channel enable, see 8.2.1“Global ADC Analog Channel Enable”.

Note : To use the channels AN0 to AN5 and AN8 to AN31, port multiplexing must be set. See chapter 5.“Port Multiplexing” and chapter 3.“Pin Description” for details. The ADC channel enable feature ADCHE is not available on the re-located channels.

8.2.3 ADC 1 Analog Inputs

ADC 1 serves the analog inputs AN37 to AN42, AN44 to AN46.

The analog inputs are enabled just by setting the ADC channel enable bits ADEn in the AD1ERH, AD1ERL registers. The Global ADC Analog Channel Enable feature is fixed ON here.

9. A/D Converter / Range Comparator (CY91F467PA)

The new A/D Converter with Range Comparator is available on CY91FV460B and CY91F467PA and is backward compatible to the A/D converter used on older devices.

This chapter provides an overview of the A/D converter, describes the register structure and functions, and describes the operation of the A/D converter.

9.1 Overview of A/D Converter and A/D Range Comparator

The A/D converter converts analog input voltages into digital values and provides the following features. Any ADC channel can be assigned to one of 4 Range Comparators.

9.1.1 Features of the A/D converter:

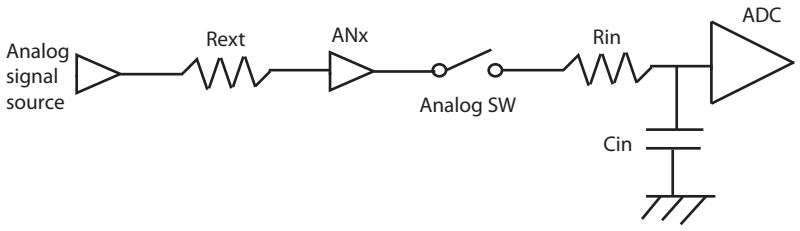
- Conversion time: minimum 1µs per channel.
- RC type successive approximation conversion with sample & hold circuit
- 10-bit or 8-bit resolution
- Program section analog input from 32 channels
- 1 common result data register and 32 dedicated channel result data registers
- Single conversion mode: Convert the specified channel(s) only once.
- Continuous mode: Repeatedly convert the specified channels.
- Scan conversion mode: Continuous conversion of multiple channels, programmable for up to 32 channels
- Stop mode: Convert one channel, then temporarily halt until the next activation. (Enables synchronization of the conversion start timing.)
- A/D conversion can be followed by an A/D conversion interrupt request to CPU. This interrupt, an option that is ideal for continuous processing can be used to start a DMA transfer of the results of A/D conversion to memory.
- A/D conversion of all enabled channels (scan conversion) can be followed by an A/D End of Scan interrupt request to CPU. The data is stored into dedicated channel result registers, which can be read out using DMA transfer.
- Conversion startup may be by software, external trigger (falling edge) or timer (rising edge).

9.1.2 Features of the A/D Range Comparator (RCO):

- 4 conversion result Range Comparator channels, comparing the upper 8 bit of the conversion result with an upper and a lower threshold. The thresholds are programmable for the 4 comparators independently.
- Any ADC channel can be assigned to one of the 4 range comparators.
- The comparison results will set “overflow” and “interrupt” flags per ADC channel, depending on the configuration. It is possible to configure the comparison for:
  - “out of range”: The flags are set if the A/D result is below the lower OR above the upper threshold.
  - “inside range”: The flags are set if the A/D result is above the lower AND below the upper threshold.
- The configuration can be set individually per ADC channel.
- Range comparison can be followed by an A/D Range Comparator interrupt request to CPU.

9.2 A/D Converter Input Impedance

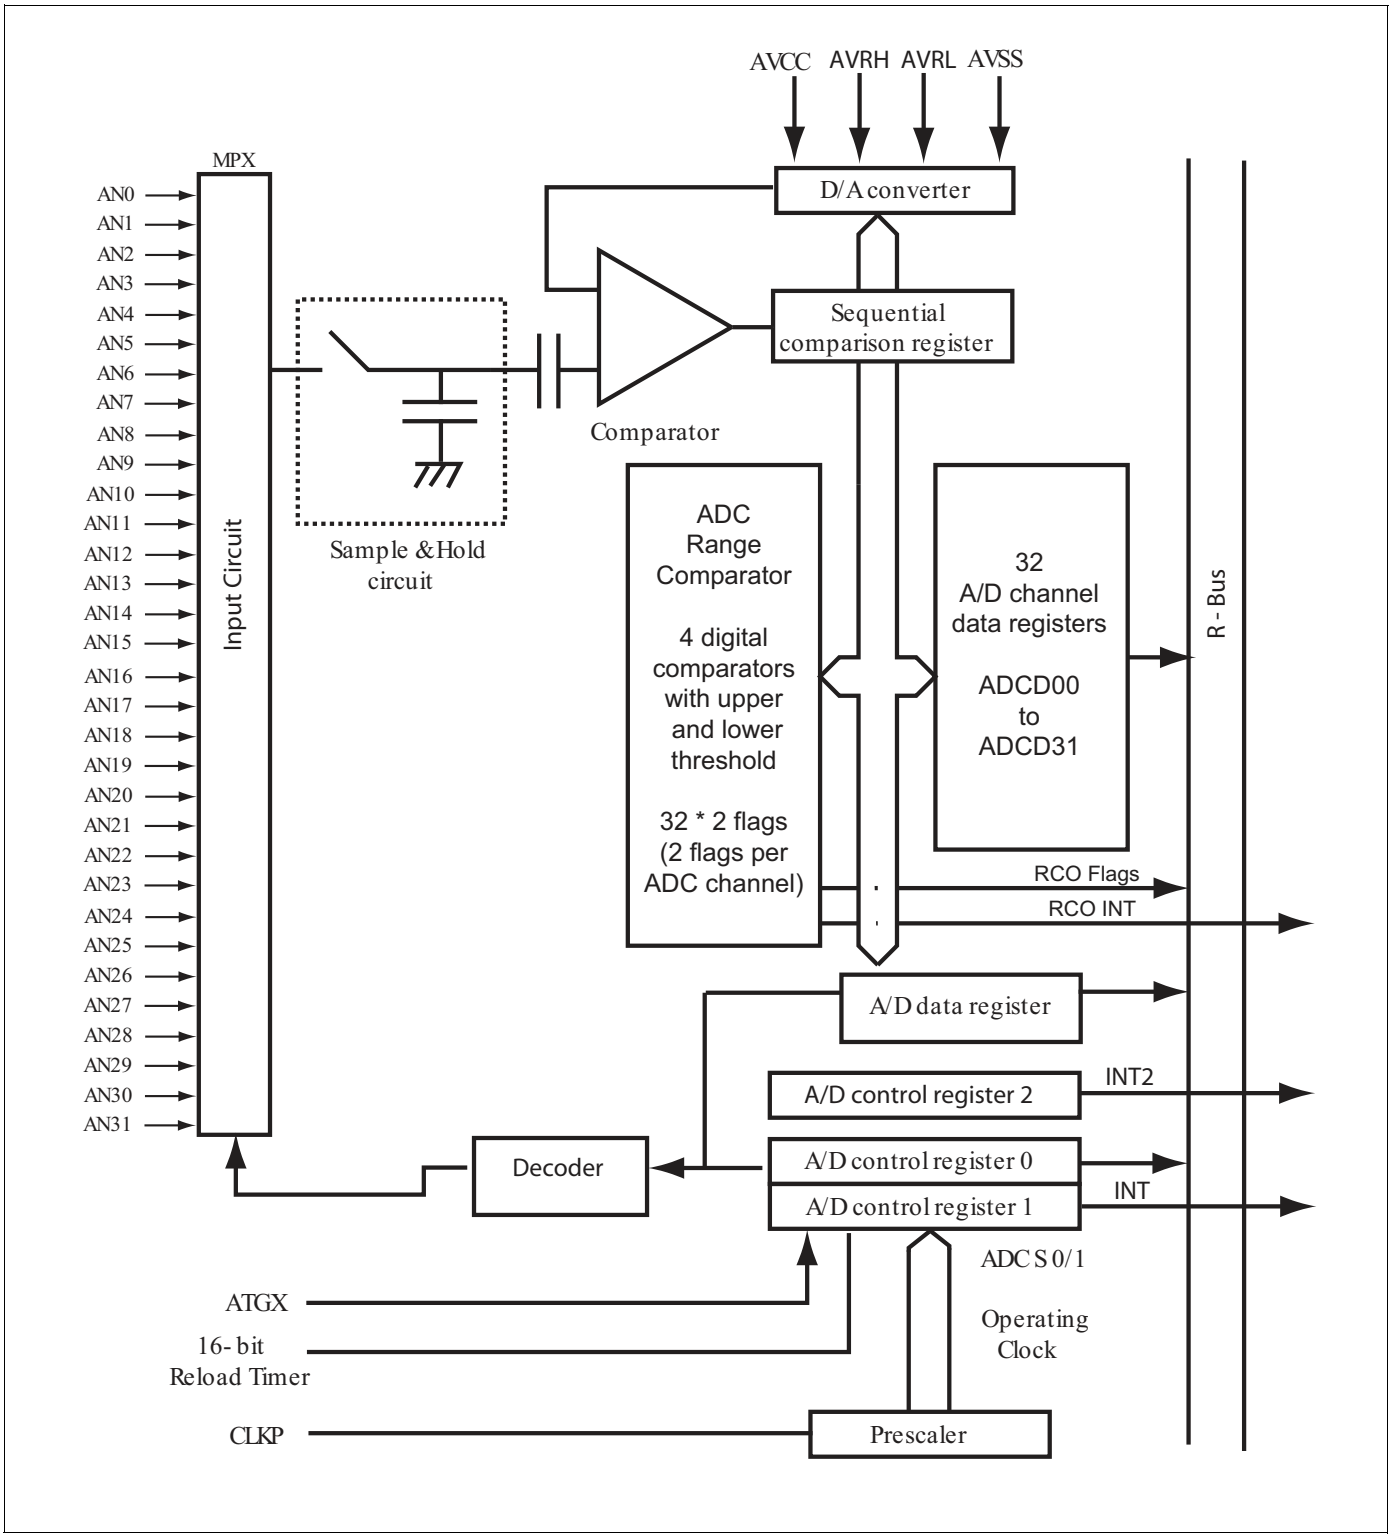
The following figure shows the sampling circuit of the A/D converter:



Do not set Rext over maximum sampling time (Tsamp).
Rext = Tsamp / (7*Cin) - Rin

9.3 Block Diagram of A/D Converter

The following figure shows block diagram of A/D converter.



9.4 Registers of the A/D Converter

The A/D converter with Range Comparator has the following registers:

Address (ADC 0)	Address (ADC 1)	x=0 or 1 for ADC0, ADC1 respectively				Register
		+0	+1	+2	+3	
$0001A0_H$	$0005E0_H$	ADxERH		ADxERL		A/D channel Enable register
$0001A4_H$	$0005E4_H$	ADxCS1	ADxCS0	ADxCR1	ADxCR0	A/D Control / Status register 0 + 1, A/D Conversion Result register
$0001A8_H$	$0005E8_H$	ADxCT1	ADxCT0	ADxSCH	ADxECH	Sampling timer setting register, Start Channel setting register, End Channel setting register
$0006B0_H$	$0006DC_H$	ADxCS2	-	-	-	A/D Control / Status register 2
000688_H	$0006B4_H$	RCOxH0	RCOxL0	RCOxH1	RCOxL1	Range Comparator 0,1 High/Low threshold registers
$00068C_H$	$0006B8_H$	RCOxH2	RCOxL2	RCOxH3	RCOxL3	Range Comparator 2,3 High/Low threshold registers
000690_H	$0006BC_H$	RCOxIRS				Range Comparator Inverted Range Select control
000694_H	$0006C0_H$	RCOxOF				Range Comparator Overflow flags
000698_H	$0006C4_H$	RCOxINT				Range Comparator Interrupt flags
$0006A0_H$	$0006CC_H$	ADxCC0	ADxCC1	ADxCC2	ADxCC3	Channel control for ch 0 to 7
$0006A4_H$	$0006D0_H$	ADxCC4	ADxCC5	ADxCC6	ADxCC7	Channel control for ch 8 to 16
$0006A8_H$	$0006D4_H$	ADxCC8	ADxCC9	ADxCC10	ADxCC11	Channel control for ch 16 to 23
$0006AC_H$	$0006D8_H$	ADxCC12	ADxCC13	ADxCC14	ADxCC15	Channel control for ch 24 to 31

9.4.1 A/D Input Enable Register (ADER)

This register enables the analog input functions of the A/D converter. On CY91F467PA, additionally the bit **ADCHE** in PORTEN register influences the enabling of analog input.

ADERH : Access: Word, Half-word, Byte

31	30	29	28	27	26	25	24	Bit
ADE31	**ADE30**	**ADE29**	**ADE28**	**ADE27**	**ADE26**	**ADE25**	**ADE24**	
0	0	0	0	0	0	0	0	Initial value
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Attribute

23	22	21	20	19	18	17	16	Bit
ADE23	**ADE22**	**ADE21**	**ADE20**	**ADE19**	**ADE18**	**ADE17**	**ADE16**	
0	0	0	0	0	0	0	0	Initial value
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Attribute

ADERL : Access: Word, Half-word, Byte

15	14	13	12	11	10	9	8	Bit
ADE15	**ADE14**	**ADE13**	**ADE12**	**ADE11**	**ADE10**	**ADE9**	**ADE8**	
0	0	0	0	0	0	0	0	Initial value

7	6	5	4	3	2	1	0	Bit
ADE7	**ADE6**	**ADE5**	**ADE4**	**ADE3**	**ADE2**	**ADE1**	**ADE0**	
0	0	0	0	0	0	0	0	Initial value
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Attribute

[ADE31-0]: A/D Input Enable

ADEn	PORTEN.ADCHE	Function
0 [initial]	X	Analog input of A/D channel n is disabled. The ADC will not sample/convert this channel.
1	0 [initial]	Analog input of the channel n is enabled. Additionally, the port function register (PFR,EPFR) of the corresponding port must be set . The PFR/EPFR will switch the port to input direction (output driver = HiZ) and disable the digital input lines.
	1	Analog input of the channel n is enabled. Setting the port function register(s) is not necessary. ADEn will disable the digital input lines of the ports, but it does not change the port's direction.

- Software reset (RST) clears ADEn and PORTEN.ADCHE to 0.
- Be sure to set start channel and end channel to cover all enabled channels.

9.4.2 A/D Control Status Registers (ADCS2, ADCS1, ADCS0)

The A/D control status registers control and show the status of A/D converter. Do not overwrite ADCS0 register during A/D converting.

ADCS2 : Access: Byte

15	14	13	12	11	10	9	8	Bit
BUSY	**INT**	**INTE**	**PAUS**	**-**	**-**	**INT2**	**INTE2**	
0	0	0	0	0	0	0	0	Initial value
R	R	R	R	R0	R0	R/W	R/W	Attribute

[bits 15:12] BUSY, INT, INTE, PAUS

These bits are a mirror of the corresponding bits in ADCS1, intended to quickly read out all status and interrupt information using only one register access. To write the bits, access them via ADCS1.

[bits 11:10] -

These bits do not exist. Read operation returns 0.

[bit 9] INT2 (End of Scan Flag)

The End of Scan flag is set when conversion data of the last channel is stored in ADCR, whereas the last channel is defined by ADECH register setting.

- If bit 8 (INTE2) is "1" when this bit is set, and the ADC runs in continuous conversion mode, an End of Scan interrupt request is generated or, if activation of DMA is enabled, DMA is activated.
- Only clear this bit by writing "0" when A/D conversion is halted.
- Initialized to "0" by a reset.
- If DMA is used, this bit is cleared at the end of DMA transfer.
- Read-modify-write operations read this bit as “1”.

[bit 8] INTE2 (Enable End of Scan Interrupt)

INTE2 enables the End of Scan interrupt in continuous conversion mode. In the other conversion modi, this bit has no effect. Additionally, setting INTE2 changes the protect function of converted data (see description of ADCS1.PAUS).

INTE2	Function
0 [initial]	Disable End of Scan interrupt, ADC result protection protects the ADCR register data.
1	Enable End of Scan interrupt, ADC result protection protects the ADCD0...ADCD31 register data (in continuous conversion mode only)

ADCS1 : Access: Half-word, Byte

15	14	13	12	11	10	9	8	Bit
BUSY	**INT**	**INTE**	**PAUS**	**STS1**	**STS0**	**STRT**	**reserved**	
0	0	0	0	0	0	0	0	Initial value
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Attribute

[bit 15] BUSY (busy flag and stop)

BUSY	Function
Reading	A/D converter operation indication bit. Set on activation of A/D conversion and cleared on completion.
Writing	Writing "0" to this bit during A/D conversion forcibly terminates conversion. Use to forcibly terminate in continuous and stop modes.

- Read-modify-write instructions read the bit as "1".
- Cleared on the completion of A/D conversion in single conversion mode.
- In continuous and stop mode, the flag is not cleared until conversion is terminated by writing "0".
- Initialized to "0" by a software reset (RST).
- Do not specify forcible termination and software activation (BUSY="0" and STRT="1") at the same time.

[bit 14] INT (End of Conversion Interrupt flag)

This bit is set when conversion data is stored in ADCR.

- If bit 5 (INTE) is "1" when this bit is set, an interrupt request is generated or, if activation of DMA is enabled, DMA is activated.
- Only clear this bit by writing "0" when A/D conversion is halted.
- Initialized to "0" by a software reset (RST).
- If DMA is used, this bit is cleared at the end of DMA transfer.

[bit 13] INTE (End of Conversion Interrupt enable)

This bit is enables or disables the conversion completion interrupt.

INTE	Function
0	Disable interrupt [Initial value]
1	Enable interrupt

- Cleared by a software reset (RST).

[bit 12] PAUS (A/D converter pause)

This bit is set when A/D conversion temporarily halts.

The A/D converter has one register to store the conversion result (ADCR) and additionally 32 ADC channel data registers. If a conversion is finished and the data of the previous conversion has not been read out before, previous data would be overwritten.

To avoid this problem, the next conversion data is not stored in the data registers until the previous value has been read out (e.g. by DMA). A/D conversion halts during this time. A/D conversion resumes when the ADC interrupt flag ADCR1.INT is cleared.

The register protection function depends on the conversion mode and the setting of ADCR2.INTE2:

Mode	INTE2	Function
Single, Stop	X	Protect ADCR (the common result register)
Continuous	0	Protect ADCR (the common result register)
	1	Protect ADCD0...ADCD31 (the dedicated channel data registers)

- In continuous mode with INTE2==1, PAUS is set when data of the start channel (set by ADSCH) is ready for writing to the registers, but IRQ2 (End of Scan interrupt) is active.
- In the other modes or if INTE2==0, PAUS is set when data of any channel is ready for writing to the registers, but IRQ (End of Conversion) is active.
- PAUS is cleared by writing “0” or by a reset. (Not cleared at the end of DMA transfer.) However when waiting condition of DMA transfer, this bit cannot be cleared.
- Regarding protect function of converted data, see Section 9.6“Operation of A/D Converter”.

[bit 11, 10] STS1, STS0 (Start source select)

These bits select the A/D activation source.

STS1	STS0	Function
0	0	Software activation [Initial value]
0	1	External trigger pin activation and software activation
1	0	Timer activation and software activation
1	1	External trigger pin activation, timer activation and software activation

- These bits are initialized "00" by software reset (RST).
- In multiple-activation modes, the first activation to occur starts A/D conversion.
- The activation source changes immediately on writing to the register. Therefore care is required when switching activation mode during A/D operation.
- The A/D converter detects falling edges on the external trigger pin. When external trigger level is “L” and if these bits are changed to external trigger activation mode, A/D converting may starts.
- Selecting the timer selects the 16-bit reload timer 7.

[bit 9] STRT (Start)

Writing "1" to this bit starts A/D conversion (software activation).

- Write "1" again to restart conversion.
- Initialized to "0" by a software reset (RST).
- In continuous and stop mode, restarting is not occurred. Check BUSY bit before writing "1". (Activate conversion after clearing.)
- Do not specify forcible termination and software activation (BUSY="0" and STRT="1") at the same time.

[bit 8] reserved bit

Always write "0" to this bit.

ADCS0 : Access: Half-word, Byte

7	6	5	4	3	2	1	0	Bit
MD1	**MD0**	**S10**	**ACH4**	**ACH3**	**ACH2**	**ACH1**	**ACH0 / ACHMD**	
0	0	0	0	0	0	0	0	Initial value
R/W	R/W	R/W	R	R	R	R	R,**W**	Attribute

[bit 7, 6] MD1, MD0 (A/D converter mode set)

These bits the operation mode.

MD1	MD0	Operating mode
0	0	Single mode 1 (Reactivation during A/D conversion is allowed)
0	1	Single mode 2 (Reactivation during A/D conversion is not allowed)
1	0	Continuous mode (Reactivation during A/D conversion is not allowed)
1	1	Stop mode (Reactivation during A/D conversion is not allowed)

- Single mode: A/D conversion is continuous performed from the selected start channel (ADSCH) to the selected end channel (ADECH). The conversion stops once it has been done for all these channels.
- Continuous mode: A/D conversion is repeatedly performed from the selected start channel (ADSCH) to the selected end channel (ADECH) in a row.
- Stop mode: A/D conversion is performed from the selected start channel (ADSCH) to the selected end channel (ADECH), followed by a pause after each channel.
  The conversion is resumed upon activation.

When A/D conversion is started in continuous mode or stop mode, conversion operation continued until stopped by the BUSY bit.

Conversion is stopped by writing “0” to the BUSY bit.

On activation after forcibly stopping, conversion starts from the start channel, selected by ADSCH register.

Reactivation during A/D conversion is disabled for any of the timer, external trigger and software start sources in single mode 2, continuous and stop mode.

[bit 5] S10

This bit defines resolution of A/D conversion. If this bit set "0", the resolution is 10-bit. In the other case, resolution is 8-bit and the conversion result is stored to ADCR0 and in the lower 8 bits of the dedicated ADC result registers.

Initialized to "0" by a reset.

[bit 4 to 0] ACH4-0 (Analog convert select channel, read-only)

These bits show the number of the currently or previously converted analog channel, depending on bit ACHMD (see below).

ACH4	ACH3	ACH2	ACH1	ACH0	Converted channel
0	0	0	0	0	AN0
0	0	0	0	1	AN1
...					...
1	1	1	1	0	AN30
1	1	1	1	1	AN31

- Writing these bits has no effect (bit 0 is writable with special function ADCHMD).
- Initialized to "0000" by software reset (RST).

[bit 0] ACHMD (ACH register mode, write-only)

For reading out the ACH4-0 register bits (see below), there is a *direct* mode and a *latched* mode.

In direct mode, ACH4-0 shows the number of the ADC channel which is *currently in conversion*, e.g. the internal conversion channel pointer. This pointer is incremented immediately after a conversion is finished.

In latched mode, ACH4-0 shows the number of the ADC channel whose conversion was *finished previously.* After a conversion is finished, the conversion channel pointer is latched and the latched data can be read in this mode. At the end of the next conversion, the latch is overwritten if no PAUSE condition exists.

ACHMD	Function
0	Direct ACH register mode [Initial value]
1	Latched ACH register mode

- ACHMD is a write-only bit.
- Read- or read-modify-write access returns the value of bit ACH0, see below.
- Initial value is 0.

9.4.3 Common Data Register (ADCR1, ADCR0)

These registers store the conversion results of the A/D converter. ADCR0 stores lower 8-bit. ADCR1 stores upper 2-bit. The register values are updated at the completion of each conversion. The registers normally store the results of the previous conversion.

ADCR1 : Access: Word, Half-word, Byte

15	14	13	12	11	10	9	8	Bit
-	-	-	-	-	-	**D9**	**D8**	
0	0	0	0	0	0	X	X	Initial value
R0, W0	R0, W0	R0, W0	R0, W0	R0, W0	R0, W0	R	R	Attribute

ADCR0 : Access: Word, Half-word, Byte

7	6	5	4	3	2	1	0	Bit
D7	**D6**	**D5**	**D4**	**D3**	**D2**	**D1**	**D0**	
X	X	X	X	X	X	X	X	Initial value
R	R	R	R	R	R	R	R	Attribute

- Bit 15 to 10 of ADCR1 are read as "0".
- The A/D converter has a conversion data protection function. See the "Operation" section for further information.

9.4.4 Dedicated A/D Channel Data Register (ADCD0 to ADCD31)

There are 32 ADC result data registers, one per channel. The registers are written by hardware at the end of conversion of the attached channel. ADCD0 is attached to channel 0, ADCD31 is attached to channel 31.

ADCD0 ... ADCD31 : Access: Word, Half-word, Byte

15	14	13	12	11	10	9	8	Bit
-	-	-	-	-	-	**D9**	**D8**	
0	0	0	0	0	0	X	X	Initial value
R0	R0	R0	R0	R0	R0	R	R	Attribute
7	6	5	4	3	2	1	0	Bit
D7	**D6**	**D5**	**D4**	**D3**	**D2**	**D1**	**D0**	
X	X	X	X	X	X	X	X	Initial value
R	R	R	R	R	R	R	R	Attribute

- Bit 15 to 10 of the ADCD registers are read as "0".
- The A/D converter has a conversion data protection function. In continuous conversion mode, the protection function can be changed to protect the A/D Channel Data registers rather then the A/D Data Register (ADCR1).
  See section 9.6.6“Protection of the ADC Channel Data Registers” for further information.

9.4.5 Sampling Timer Setting Register (ADCT)

ADCT register controls the sampling time and comparison time of analog input. This register sets A/D conversion time. Do not update value of this register during A/D conversion operation.

ADCT1: Access: Word, Half-word, Byte

15	14	13	12	11	10	9	8	Bit
CT5	**CT4**	**CT3**	**CT2**	**CT1**	**CT0**	**ST9**	**ST8**	
0	0	0	1	0	0	0	0	Initial value
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Attribute

ADCT0: Access: Word, Half-word, Byte

7	6	5	4	3	2	1	0	Bit
ST7	**ST6**	**ST5**	**ST4**	**ST3**	**ST2**	**ST1**	**ST0**	
0	0	1	0	1	1	0	0	Initial value
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Attribute

[bit 15 to 10] CT5-0 (A/D comparison time set)

These bits specify clock division of comparison time.

- Setting "000001" means one division (=CLKP).
- Do not set these bits "000000".
- Initialized these bits to "000100" by software reset (RST).
- Comparison time = CT value * CLKP cycle * 10 + (4 * CLKP)
- Do not set comparison time over 500 µs.

[bit 9 to 0] ST9-0 (Analog input sampling time set)

These bits specify sampling time of analog input.

- Initialized these bits to "0000101100" by software reset (RST).
- Sampling time = ST value * CLKP cycle
- Do not set sampling time below 1.2 µs when AVCC is below 4.5 V.

Necessary sampling time and ST value are calculated by following.

- Necessary sampling time (Tsamp) = (Rext + Rin) * Cin * 7
- ST9 to ST0 = Tsamp / CLKP cycle

ST has to be set that sampling time is over Tsamp.
Example: CLKP = 32MHz, AVCC >= 4.5V, Rext = 200KΩ

Tsamp = ($200 * 10^3 + 2.52 * 10^3$) * $10.7 * 10^{-12} * 7 = 15.17$ [µs]
ST = $15.17^{-6} / 31.25^{-9} = 485.44$
ST has to be set over 486_D (111100110_B).

Tsamp is decided by Rext. Thus conversion time should be considered together with Rext.

9.4.6 A/D Channel Setting Register (ADSCH, ADECH)

These registers specify the channels for the A/D converter to convert. Do not update these registers while the A/D converting is operating.

ADSCH: Access: Word, Half-word, Byte

15	14	13	12	11	10	9	8	Bit
-	-	-	ANS4	ANS3	ANS2	ANS1	ANS0	
-	-	-	0	0	0	0	0	Initial value
RX, W0	RX, W0	RX, W0	R/W	R/W	R/W	R/W	R/W	Attribute

ADECH : Access: Word, Half-word, Byte

7	6	5	4	3	2	1	0	Bit
-	-	-	ANE4	ANE3	ANE2	ANE1	ANE0	
-	-	-	0	0	0	0	0	Initial value
RX, W0	RX, W0	RX, W0	R/W	R/W	R/W	R/W	R/W	Attribute

These bits set the start and end channel for A/D converter.

- Setting of ANE4 to ANE0 the same channel as in ANS4 to ANS0 specifies conversion for that channel only. (Single conversion)
- In continuous or stop mode, conversion is performed up to the channel specified by ANE4 to ANE0. Conversion then starts again from the start channel specified by ANS4 to ANS0.
- If ANS > ANE, conversion starts with the channel specified by ANS, continuous up to channel 31, starts again from channel 0, and ends with the channel specified by ANE.
- Initialized to ANS="00000", ANE="00000" by a software reset (RST).

Example: Channel Setting ANS=30ch, ANE=3ch, single conversion mode

Operation : Conversion channel 30ch -> 31ch -> 0ch -> 1ch -> 2ch -> 3ch end

[bit 12 to 8] ANS4-0 (Analog start channel set)

[bit 4 to 0] ANE4-0 (Analog end channel set)

ANS4 ANE4	ANS3 ANE3	ANS2 ANE2	ANS1 ANE1	ANS0 ANE0	Start / End Channel
0	0	0	0	0	AN0
0	0	0	0	1	AN1
0	0	0	1	0	AN2
0	0	0	1	1	AN3
...					...
1	1	1	0	1	AN29
1	1	1	1	0	AN30
1	1	1	1	1	AN31

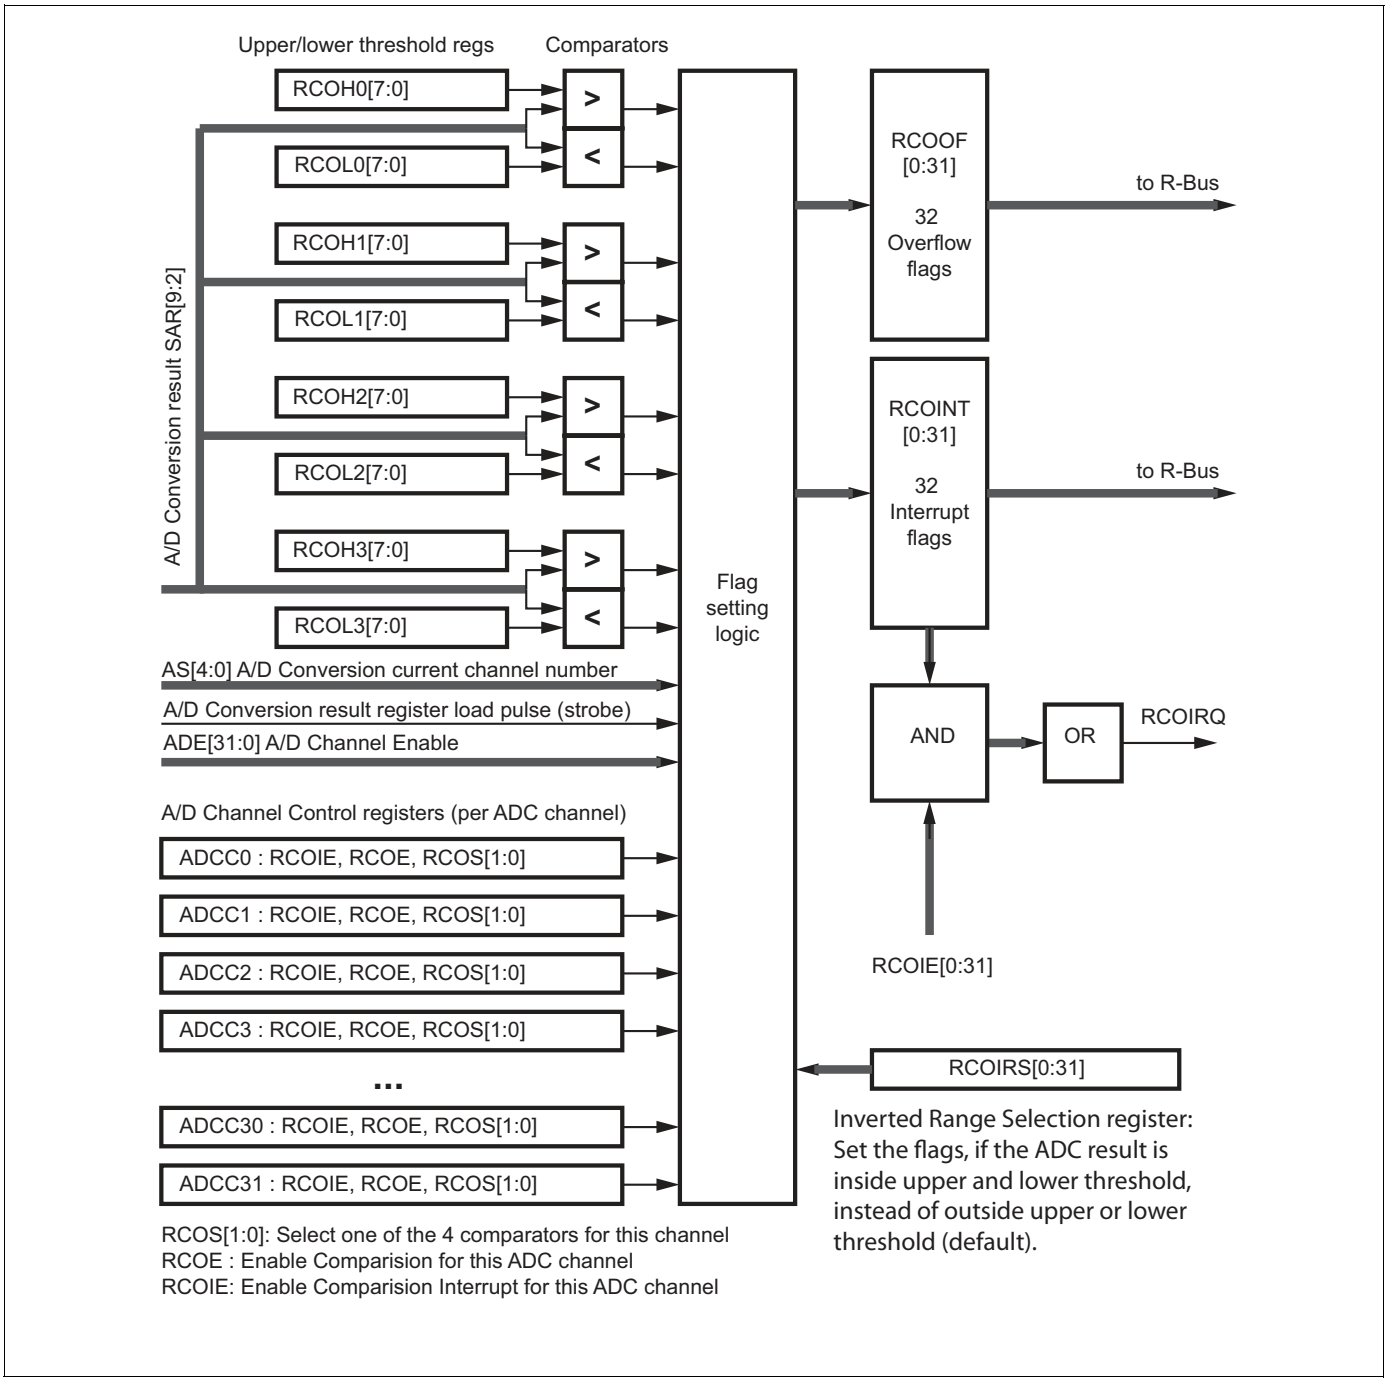
9.5 Range Comparator

9.5.1 Range Comparator Structure

The Range Comparator has 4 comparison groups with an upper and a lower threshold register each. The 32 ADC channels can be enabled for range comparison and assigned to one of the 4 comparators individually. If enabled, the comparison will set up to 2 flags for this ADC channel:

- An interrupt flag RCOINT, signalling that the ADC result is outside the range or, by “inverted” configuration, inside the range.
- An overflow flag RCOOF, showing that the range violation was an overflow and no underflow.

Furthermore, each ADC channel can be enabled to send an interrupt request to the CPU, if the RCOINT flag is set.



9.5.2 Range Comparator Registers

The Range Comparator (RCO) has the following registers:

- RCOHx[7:0] : Upper threshold register, one register per comparator block (x = 0...3)
- RCOLx[7:0] : Lower threshold register, one register per comparator block (x = 0...3)
- ADCCm[7:0] : ADC channel control, one register per 2 ADC channels (m = 0...15)
- RCOIRS[0:31] : RCO Inverted Range Selection, one bit per ADC channel
- RCOOF[0:31] : RCO Overflow Flags, one bit per ADC channel, read-only
- RCOINT[0:31] : RCO Interrupt Flags, one bit per ADC channel

Range Comparator Threshold registers (RCOH0/L0 to RCOH3/L3)

RCOH0-3 : Higher threshold, access: Word, Half-word, Byte

15	14	13	12	11	10	9	8	Bit
RCOH7	**RCOH6**	**RCOH5**	**RCOH4**	**RCOH3**	**RCOH2**	**RCOH1**	**RCOH0**	
1	1	1	1	1	1	1	1	Initial value
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Attribute

[bit 7:0] RCOH[7:0] (Range Comparator High threshold)

The RCOH bits define the higher comparison threshold of the Range Comparator channel.

The upper Range Comparator compares that the upper 8 bits of the ADC conversion result are higher then RCOH[7:0] .

RCOL0-3 : Lower threshold, access: Word, Half-word, Byte

7	6	5	4	3	2	1	0	Bit
RCOL7	**RCOL6**	**RCOL5**	**RCOL4**	**RCOL3**	**RCOL2**	**RCOL1**	**RCOL0**	
0	0	0	0	0	0	0	0	Initial value
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Attribute

[bit 7:0] RCOL[7:0] (Range Comparator Low threshold)

The RCOL bits define the lower comparison threshold of the Range Comparator channel.

The lower Range Comparator compares that the upper 8 bits of the ADC conversion result are lower then RCOL[7:0] .

A/D Converter Channel Control registers (ADCC0 to ADCC15)

The A/D channel control registers serve 2 ADC channels per register and control the range comparison for these channels.

ADCC0 register controls A/D channels 0 + 1,
ADCC1 register controls A/D channels 2 + 3,
...
ADCC15 register controls A/D channels 30 + 31

ADCC0-15: Access: Word, Half-word, Byte

7	6	5	4	3	2	1	0	Bit
RCOIE1	**RCOE1**	**RCOS11**	**RCOS10**	**RCOIE0**	**RCOE0**	**RCOS01**	**RCOS00**	
0	0	0	0	0	0	0	0	Initial value
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Attribute
Bits 7:4 control A/D channels 1,3,5,7,...31				Bits 3:0 control A/D channels 0,2,4,6,...,30				

[bit 7,3] RCOIE1, RCOIE0 (Range Comparator Interrupt enable)

The RCOIE bits enable the Range Comparator interrupt for the corresponding ADC channel.

RCOIE	Function
0	RCO interrupt for this ADC channel is disabled [default]
1	RCO interrupt for this ADC channel is enabled

[bit 6,2] RCOE1, RCOE0 (Range Comparator operation enable)

The RCOE bits enable the Range Comparison for the corresponding ADC channel:

RCOE	Function
0	RCO disabled, RCO flags for this ADC channel will not be set [default]
1	RCO enabled for this ADC channel

[bits 5:4,1:0] RCOS1[1:0], RCOS0[1:0] (converter channel select)

These bits select the A/D converter channel to be assigned to the Range Comparator channel:

RCOS[1:0]	Function
00	Select range comparator channel 0 for this ADC channel [default]
01	Select range comparator channel 1 for this ADC channel
10	Select range comparator channel 2 for this ADC channel
11	Select range comparator channel 3 for this ADC channel

Inverted Range Selection register

The RCOIRS register controls that the comparison should check for “out of range” or “inside range”.
The 32 bits of RCOIRS is organized “per ADC channel”. ADC channel 0 is located on the MSB of the register and ADC channel 31 is on the LSB.

RCOnIRS : Access: Word, Half-word, Byte

31	30	29	28	27	26	259	24	Bit

Note that bit[31] is assigned to ADC channel 0, bit[30] is assigned to ADC channel one and so on.

[bits 31:0] RCOIRS[0:31] (Inverted Range Select)

The RCOIRS bits control how the Range Comparator result flags are set.

- If the RCOIRS[n] is 0, the flags are set when the ADC result is above the upper threshold OR below the lower threshold. That is called “**out of range**” mode.
- If the RCOIRS[n] is 1, the flags are set when the ADC result is below or equal the upper threshold AND above or equal the lower threshold. That is called “**inside range**” mode.

RCOIRSn	Function
0	Range comparison for this ADC channel checks for “out of range” (default)
1	Range comparison for this ADC channel checks for “inside range”

Range Comparator Result Flags

The result of range comparison is stored in 2 flag registers:

- RCOINT[0:31]:Range comparison interrupt flags
- RCOOF[0:31]: Range comparison overflow flags

The Range Comparator Result flags are organized “per ADC channel”. There are 32 Range Comparator overflow flags and 32 interrupt flags. In case of a RCO interrupt, all interrupt flags can be read out by one 32-bit read operation and analyzed using the Bit Search Unit. The Bit Search Unit will return the number of the interrupting channel. Since bit search works from MSB to LSB (from left to right), ADC channel 0 is located on the MSB of the registers and ADC channel 31 is on LSB.

Note that bit[31] is assigned to ADC channel 0, bit[30] is assigned to ADC channel one and so on.

[bits 31:0] RCOINT[0:31] (Range Comparator Interrupt flags)

The RCOINT flags show that a “out of range” or “inside range” condition has been found on the ADC channel.

The bits are set under the following condition:

- the ADC channel is enabled — ADER.ADE[i] is set — and
- the range comparison for this channel is enabled — ADCCn.RCOE[i] is set — and
- the conversion of the ADC channel is just finished — and
- an interrupt condition was found (see the table on next page).

- The bits are cleared by writing 0 or by software reset (RST). Writing 1 has no effect.
- Read-modify-write operations read 1.

The interrupt condition depends on the comparison results and the RCOIRS setting for this channel:

Mode	RCOIRS	Upper threshold comparator	Lower threshold comparator	Interrupt condition
out of range	0	1	x	INT condition: above range, RCOOF is set
		0	0	-
		x	1	INT condition: below range, RCOOF is cleared
inside range	1	1	x	-
		0	0	INT condition: inside range
		x	1	-

Note: The upper threshold comparator returns 1 if the upper 8 bits of the ADC result are greater then the threshold value in RCOH[7:0]. The lower threshold comparator returns 1 if the upper 8 bits of the ADC result are smaller then the threshold value in RCOL[7:0].

Note that bit[31] is assigned to ADC channel 0, bit[30] is assigned to ADC channel one and so on.

[bits 31:0] RCOOF[0:31] (Range Comparator Overflow flag)

The RCOOF read-only flags store the output signal of the upper threshold comparator at the time when an interrupt condition (see above) appeared and the corresponding RCOINT flag was **not** set. So the RCOOF flags indicate the upper comparator state when the RCOINT flag had the last rising edge.

The RCOOF flag for a ADC channel is loaded with the upper threshold comparator output signal under the following condition:

- the corresponding RCOINT flag is not yet setand
- the corresponding RCOINT flag has a set condition in this cycle.

The flags are initialized by software reset (RST).

RCOOFn	Function
0	The output of the upper threshold comparator was 0 [default]
1	The output of the upper threshold comparator was 1

9.5.3 Range Comparator Interrupt request

The Range Comparator has one interrupt output line RCOIRQ. The interrupt output line becomes active if at least one of the Range Comparator interrupt flags RCOINT[31:0] is set and the corresponding interrupt enable bit in the ADCC registers is set.

It is not possible to activate a DMA request from the range comparator interrupts.

9.6 Operation of A/D Converter

The A/D converter operates using the successive approximation method with 10-bit or 8-bit resolution. There is one 16-bit register provided to store conversion results (ADCR), which is updated each time conversion completes. Additionally, there is one ADC Channel Data register per channel (ADCD0...31), which is updated each time the assigned channel is converted. The Channel Data registers especially improve the continuous conversion mode.
It is recommended to use the DMA service. The following describes the operation modes.

9.6.1 Single Mode

In single conversion mode, the analog input signals selected by the ANS bits and ANE bits are converted in order until the completion of conversion on the end channel determined by the ANE bits. A/D conversion then ends. If the start channel and end channel are the same (ANS=ANE), only a single channel conversion is performed.

Examples:

- ANS=00000b, ANE=00011b
  Start -> AN0 -> AN1 -> AN2 -> AN3 -> End
- ANS=00010b, ANE=00010b
  Start -> AN2 -> End

9.6.2 Continuous Mode

In continuous mode the analog input signals selected by the ANS bits and ANE bits are converted in order until the completion of conversion on the end channel determined by the ANE bits, then the converter returns to the ANS channel for analog input and repeats the process continuously. When the start and end channels are the same (ANS=ANE), conversion is performed continuously for that channel.

Examples:

- ANS=00000b, ANE=00011b
  Start -> AN0 -> AN1 -> AN2 -> AN3 -> AN0 ... -> repeat
- ANS=00010b, ANE=00010b
  Start -> AN2 -> AN2 -> AN2 ... -> repeat

In continuous mode, conversion is repeated until '0' is written to the BUSY bit. (Writing '0' to the BUSY bit forcibly stops the conversion operation.) Note that forcibly terminating operation halts the current conversion during mid-conversion. (If operation is forcibly terminated, the value in the conversion register is the result of the most recently completed conversion.)

9.6.3 Stop Mode

In stop mode the analog input signal selected by the ANS bits and ANE bits are converted in order, but conversion operation pauses after each channel. The pause is released by applying another start signal.

At the completion of conversion on the end channel determined by the ANE bits, the converter returns to the ANS channel for analog input signal and repeats the conversion process continuously. When the start and end channel are the same (ANS=ANE), only a signal channel conversion is performed.

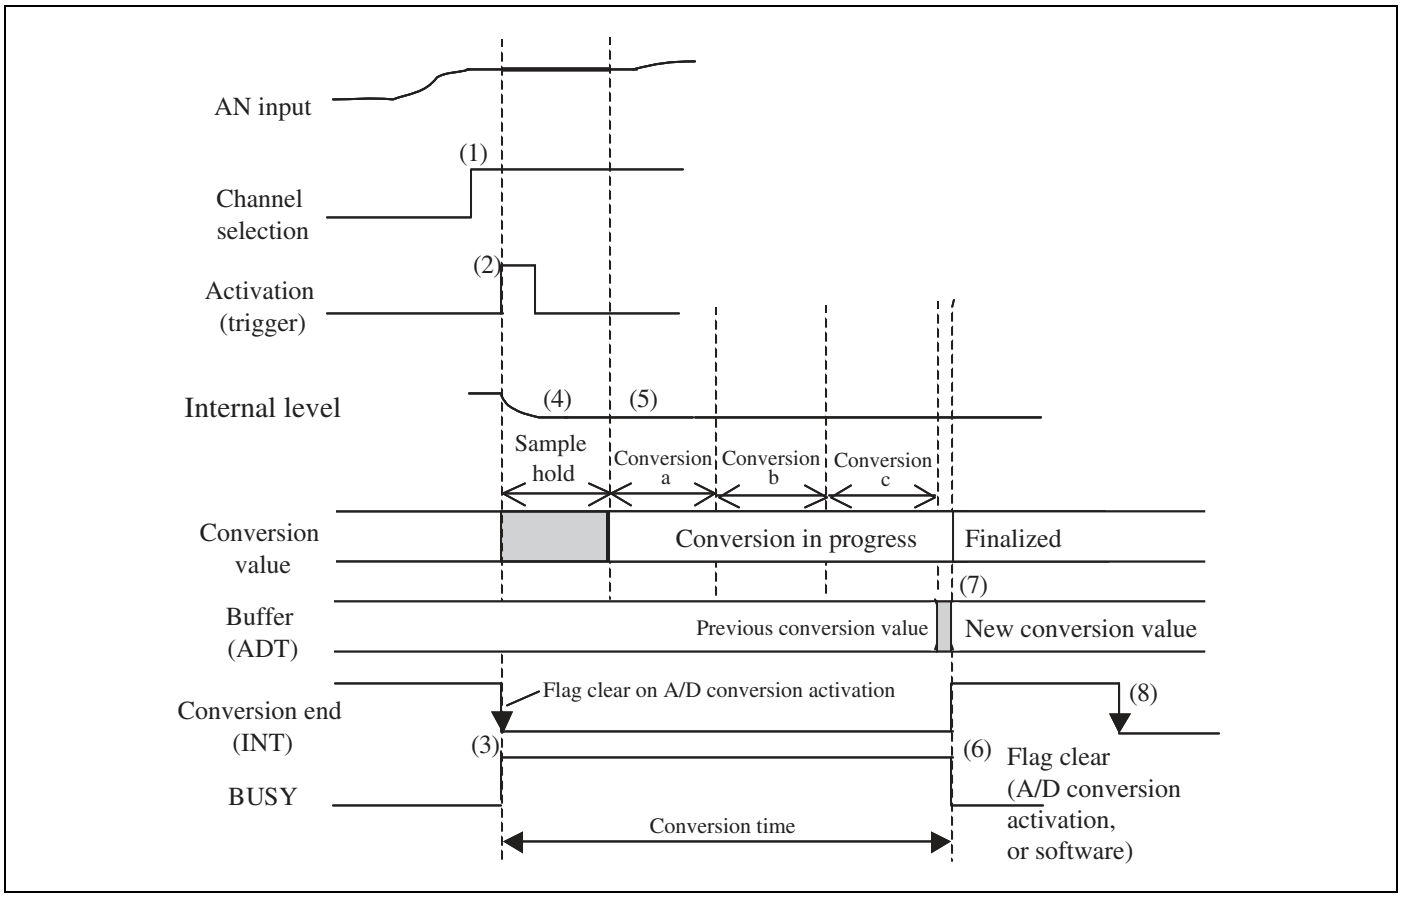
Examples:

- ANS=00000b, ANE=00011b
  Start -> AN0 -> stop -> start -> AN1 -> stop -> start -> AN2 -> stop -> start -> AN3 -> stop -> start -> AN0 ... -> repeat
- ANS=00010b, ANE=00010b
  Start -> AN2 -> stop -> start -> AN2 -> stop -> start -> AN2 ... -> repeat

In stop mode the startup source is the source determined by the STS1, STS0 bits. This mode enables synchronization of the conversion start signal.

9.6.4 Single-shot Conversion

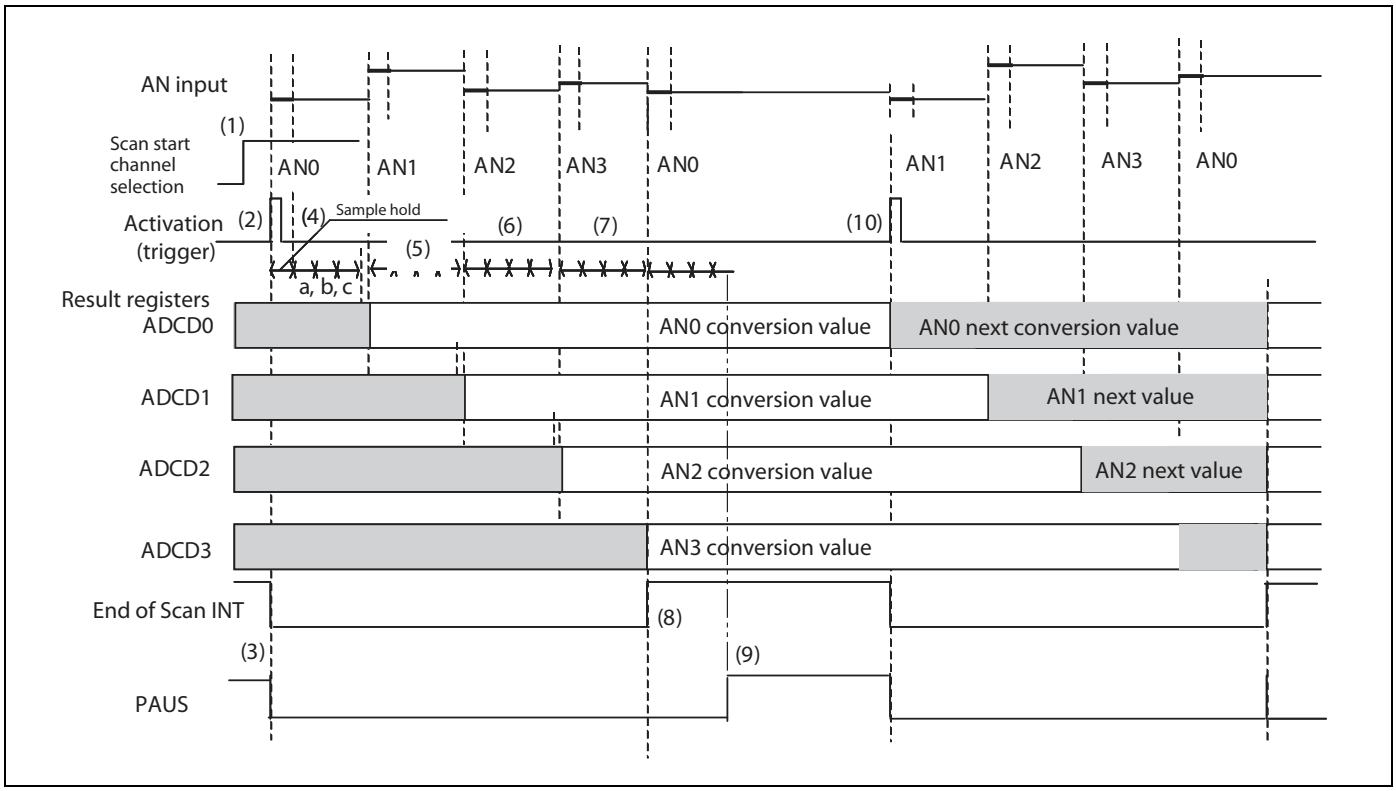
The following figure shows the operation of A/D converter in Single-shot conversion mode



(1) Channel selection
(2) A/D conversion activation (Trigger input: Software trigger/Reload timer/External trigger)
(3) INT flag clear, BUSY flag set
(4) Sample hold
(5) Conversion (Conversion a + Conversion b + Conversion c)
(6) Conversion end, INT flag set, BUSY flag clear
(7) Buffers the conversion value. Buffered data storage
(8) Software-based INT flag clear

9.6.5 Scan Conversion

The following figure shows the operation of A/D converter in Scan conversion mode



(1) Activation channel selection

(2) A/D activation (Trigger: Software trigger/Reload timer/External trigger)

(3) INT flag clear, PAUS flag clear

(4) AN0 conversion
a. Sample hold, conversion (conversion a + conversion b + conversion c)
b. Conversion end
c. Buffers the conversion value.

(5) AN1 conversion

(6) AN2 conversion

(7) AN3 conversion

(8) INT2 (End of Scan) flag is set, AN0 conversion starts

(9) Because INT2 has not been cleared yet, the ADC protects the result register of AN0 against overwriting and enters PAUSE state.

(10) INT2 flag cleared by DMA or by software, the ADC stores the result of AN0 and continues sampling AN1.

9.6.6 Protection of the ADC Channel Data Registers

There are 32 ADC result data registers, one register per channel. The registers are written by hardware at the end of conversion of the attached channel. ADCD0 is attached to channel 0, ADCD31 is attached to channel 31.

The CPU can read the data registers any time.

If a conversion is finished and the data of the previous conversion has not been read out before, previous data would be overwritten. To avoid this problem, the next conversion data is not stored in the data registers until the previous value has been read out (e.g. by DMA). A/D conversion halts during this time and the PAUS flag is set. A/D conversion restarts when the ADC interrupt flag ADCR1.INT is cleared.

The register protection function depends on the conversion mode and the setting of ADCR2.INTE2:

Mode	INTE2	Function
Single, Stop	X	Protection of ADCR
Continuous	0	Protection of ADCR
	1	Protection of ADCD0...ADCD31

Protection of ADCD0...31

In continuous mode with INTE2==1, PAUS is set when data of the **start channel (set by ADSCH)** is ready for writing to the registers, but IRQ2 (End of Scan interrupt) is already active.

Example: Start channel =4, end channel=7, continous mode, ADCS1.INTE=0, ADCS2.INTE2=1

Start by CPU --> convert channel 4 + safe data to ADCD4,
convert channel 5 + safe data to ADCD5,
convert channel 6 + safe data to ADCD6,
convert channel 7 + safe data to ADCD7 ---> End of Scan interrupt (IRQ2),
convert channel 4 + set PAUS (protect ADCD4...7).

After the CPU or DMA have read the data registers and cleared IRQ2, the scan conversion continues.

Protection of ADCR

In the other modes or if INTE2==0, PAUS is set when data of any channel is ready for writing to the registers, but IRQ (End of Conversion) is active. Because in this mode the protection function is active after each single conversion, the ADCR register is protected.

9.7 ADC Interrupt Generation and DMA Access

There are 2 ADC interrupt sources: End of Conversion and End of Scan.

9.7.1 End of Conversion

The End of Conversion (EoC) interrupt is enabled by ADCS1.INTE bit and is compatible to the A/D converts in old devices of CY91460 series. If EoC is enabled, it appears after any conversion cycle. It is recommended to use DMA transfer to read out the data from ADCR.

9.7.2 End of Scan

The End of Scan (EoS) interrupt is enabled by ADCS2.INTE2 bit. If EoS is enabled, it appeares after the conversion of the end channel, which is defined by the setting of ADECH register.

If the End of Conversion interrupt is enabled in parallel, both interrupt bits are set. In this case it is recommended that the interrupt routine reads out ADCS2 register (containing mirrored bits of ADCS1[7:4]) to check where the interrupt comes from.

9.7.3 DMA Transfer

DMA transfer can be triggered by End of Conversion interrupt or by End of Scan interrupt. The interrupts are assigned to separate DMA resource numbers (please refer to the Interrupt Vector Table).

The automatic interrupt clear after DMA transfer works for End of Conversion and for End of Scan separately.

10. Handling Devices

10.1 Preventing Latch-up

Latch-up may occur in a CMOS IC if a voltage higher than ($V_{DD}5$, $V_{DD}35$ or $HV_{DD}5$ *1) or less than ($V_{SS}5$ or $HV_{SS}5$ *1) is applied to an input or output pin or if a voltage exceeding the rating is applied between the power supply pins and ground pins. If latch-up occurs, the power supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Therefore, be very careful not to apply voltages in excess of the absolute maximum ratings.

Note *1: $HV_{DD}5$, $HV_{SS}5$ are available only on devices having Stepper Motor Controller.

10.2 Handling of unused input pins

If unused input pins are left open, abnormal operation may result. Any unused input pins should be connected to pull-up or pull-down resistor (2KΩ to 10KΩ) or enable internal pullup or pulldown resisters (PPER/PPCR) before the input enable (PORTEN) is activated by software. The mode pins MD_x can be connected to $V_{SS}5$ or $V_{DD}5$ directly. Unused ALARM input pins can be connected to $AV_{SS}5$ directly.

10.3 Power supply pins

In CY91460 series, devices including multiple power supply pins and ground pins are designed as follows; pins necessary to be at the same potential are interconnected internally to prevent malfunctions such as latch-up. All of the power supply pins and ground pins must be externally connected to the power supply and ground respectively in order to reduce unnecessary radiation, to prevent strobe signal malfunctions due to the ground level rising and to follow the total output current ratings. Furthermore, the power supply pins and ground pins of the CY91460 series must be connected to the current supply source via a low impedance.
It is also recommended to connect a ceramic capacitor of approximately 0.1 µF as a bypass capacitor between power supply pin and ground pin near this device.
This series has a built-in step-down regulator. Connect a bypass capacitor of 4.7 µF (use a X7R ceramic capacitor) to VCC18C pin for the regulator.

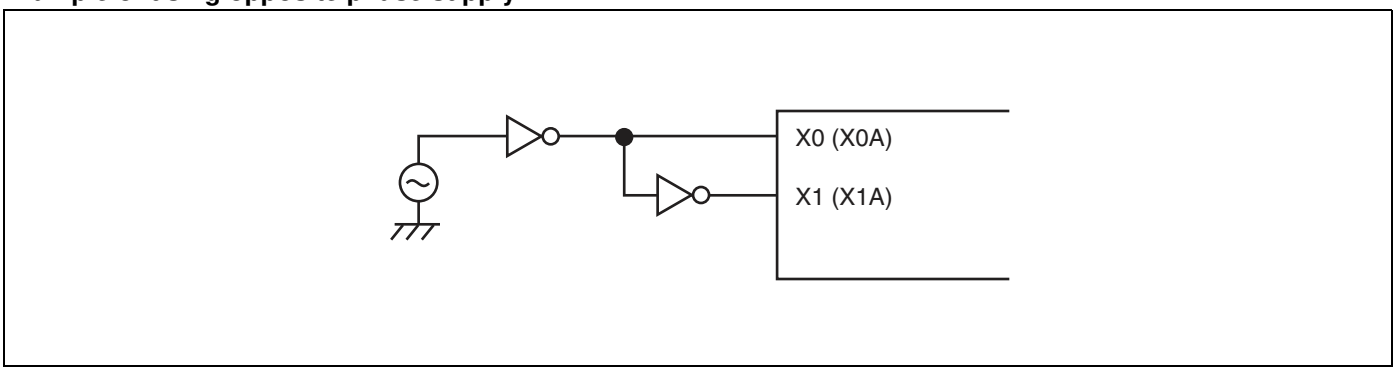
10.4 Crystal oscillator circuit

Noise in proximity to the X0 (X0A) and X1 (X1A) pins can cause the device to operate abnormally. Printed circuit boards should be designed so that the X0 (X0A) and X1 (X1A) pins, and crystal oscillator, as well as bypass capacitors connected to ground, are located near the device and ground.
It is recommended that the printed circuit board layout be designed such that the X0 and X1 pins or X0A and X1A pins are surrounded by ground plane for the stable operation.
Please request the oscillator manufacturer to evaluate the oscillational characteristics of the crystal and this device.

10.5 Notes on using external clock

When using the external clock, it is necessary to simultaneously supply the X0 (X0A) and the X1 (X1A) pins. In the described combination, X1 (X1A) should be supplied with a clock signal which has the opposite phase to the X0 (X0A) pins. At X0 and X1, a frequency up to 16 MHz is possible.

Example of using opposite phase supply



10.6 Mode pins (MD_x)

These pins should be connected directly to the power supply or ground pins. To prevent the device from entering test mode accidentally due to noise, minimize the lengths of the patterns between each mode pin and power supply pin or ground pin on the printed circuit board as possible and connect them with low impedance.

10.7 Notes on operating in PLL clock mode

If the oscillator is disconnected or the clock input stops when the PLL clock is selected, the microcontroller may continue to operate at the free-running frequency of the self-oscillating circuit of the PLL. However, this self-running operation cannot be guaranteed.

10.8 Pull-up control

The AC standard is not guaranteed in case a pull-up resistor is connected to the pin serving as an external bus pin.

11. Notes on Debugger

11.1 Execution of the RETI Command

If single-step execution is used in an environment where an interrupt occurs frequently, the corresponding interrupt handling routine will be executed repeatedly to the exclusion of other processing. This will prevent the main routine and the handlers for low priority level interrupts from being executed (For example, if the time-base timer interrupt is enabled, stepping over the RETI instruction will always break on the first line of the time-base timer interrupt handler).

Disable the corresponding interrupts when the corresponding interrupt handling routine no longer needs debugging.

11.2 Break function

If the range of addresses that cause a hardware break (including event breaks) is set to the address of the current system stack pointer or to an area that contains the stack pointer, execution will break after each instruction regardless of whether the user program actually contains data access instructions.

To prevent this, do not set (word) access to the area containing the address of the system stack pointer as the target of the hardware break (including an event breaks).

11.3 Operand break

It may cause malfunctions if a stack pointer exists in the area which is set as the DSU operand break. Do not set the access to the areas containing the address of system stack pointer as a target of data event break.

11.4 Notes on PS register

As the PS register is processed in advance by some instructions, when the debugger is being used, the exception handling may result in execution breaking in an interrupt handling routine or the displayed values of the flags in the PS register being updated.
As the microcontroller is designed to carry out reprocessing correctly upon returning from such an EIT event, the operation before and after the EIT always proceeds according to specification.

The following behavior may occur if any of the following occurs in the instruction immediately after a DIV0U/DIV0S instruction:

(a) a user interrupt or NMI is accepted;

(b) single-step execution is performed;

(c) execution breaks due to a data event or from the emulator menu.

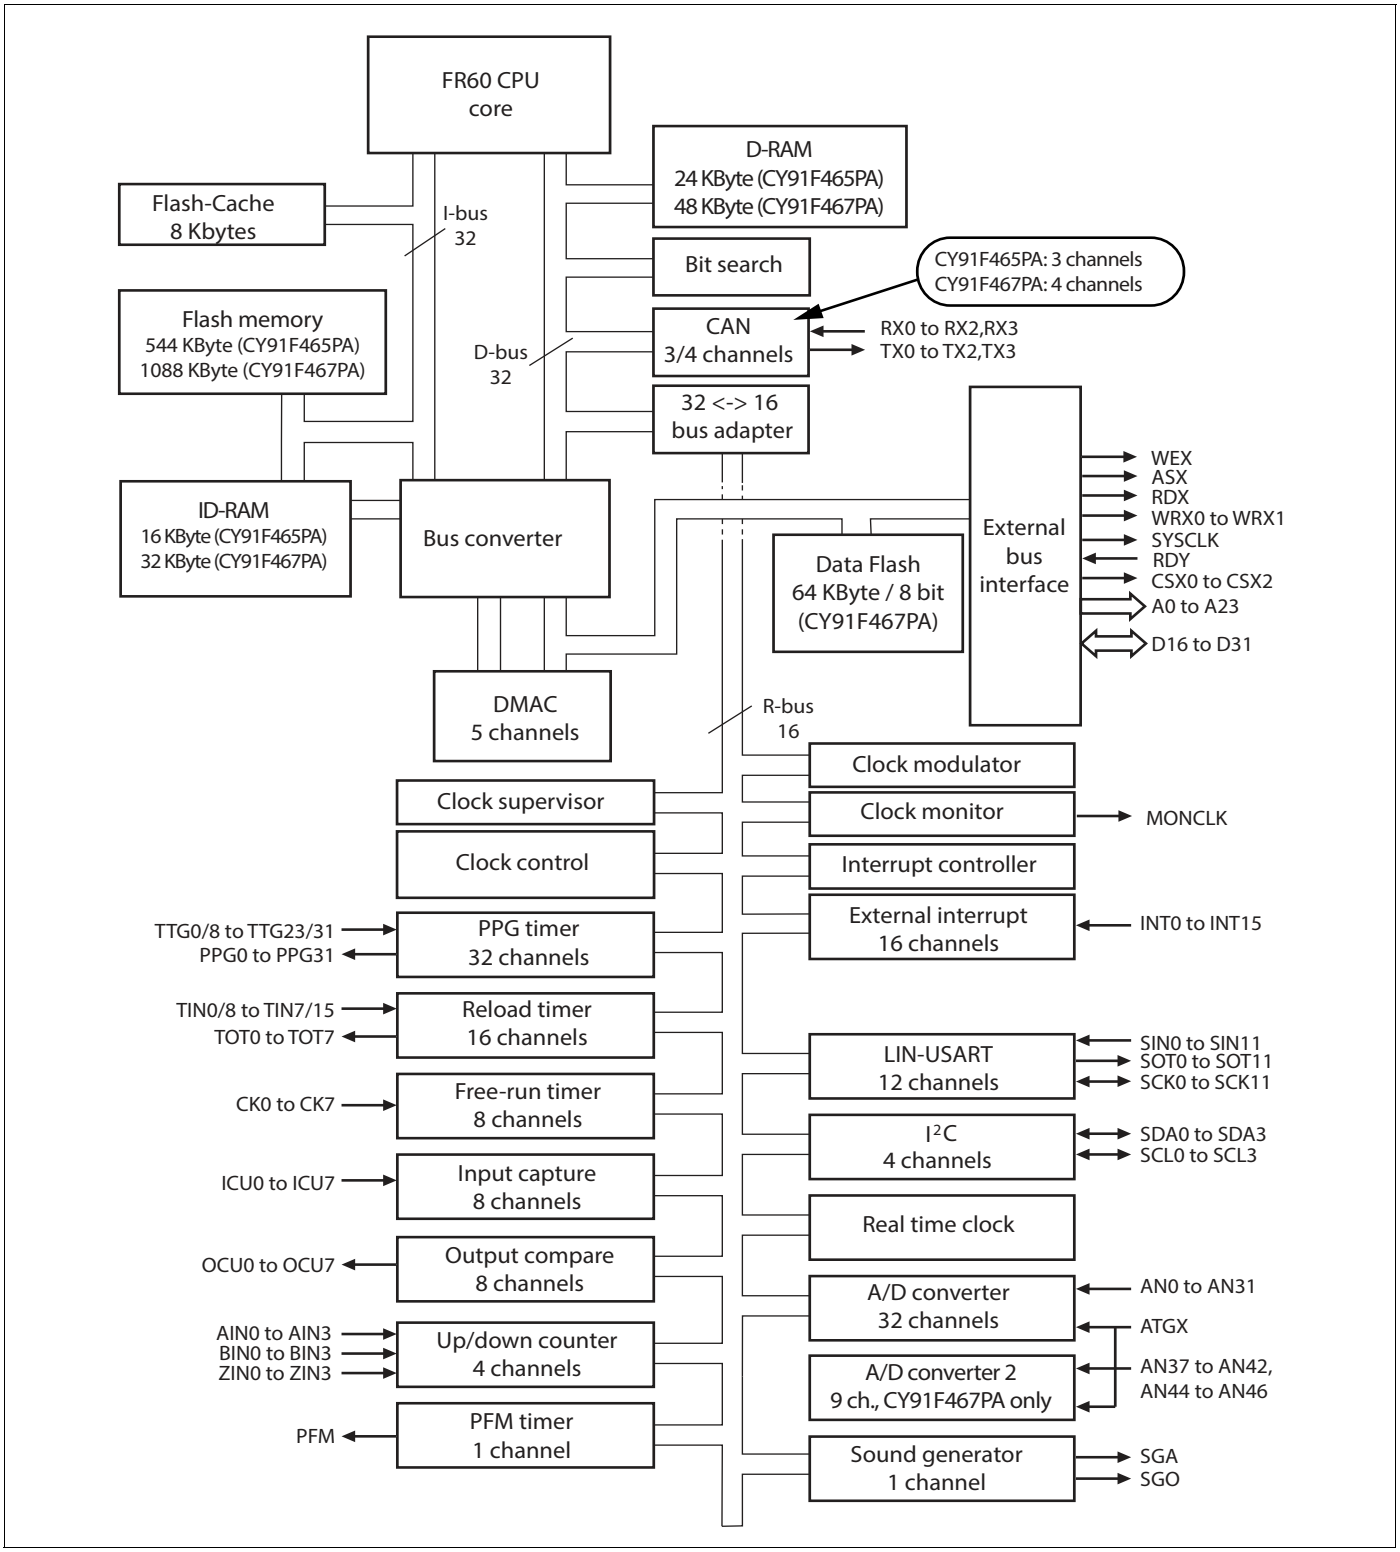
1. D0 and D1 flags are updated in advance.
2. An EIT handling routine (user interrupt/NMI or emulator) is executed.
3. Upon returning from the EIT, the DIV0U/DIV0S instruction is executed and the D0 and D1 flags are updated to the same values as those in 1.

The following behavior occurs when an ORCCR, STILM, MOV Ri,PS instruction is executed to enable a user interrupt or NMI source while that interrupt is in the active state.

1. The PS register is updated in advance.
2. An EIT handling routine (user interrupt/NMI or emulator) is executed.
3. Upon returning from the EIT, the above instructions are executed and the PS register is updated to the same value as in 1.

12. Block Diagram

12.1 CY91F465PA, CY91F467PA



13. CPU and Control Unit

The FR family CPU is a high performance core that is designed based on the RISC architecture with advanced instructions for embedded applications.

13.1 Features

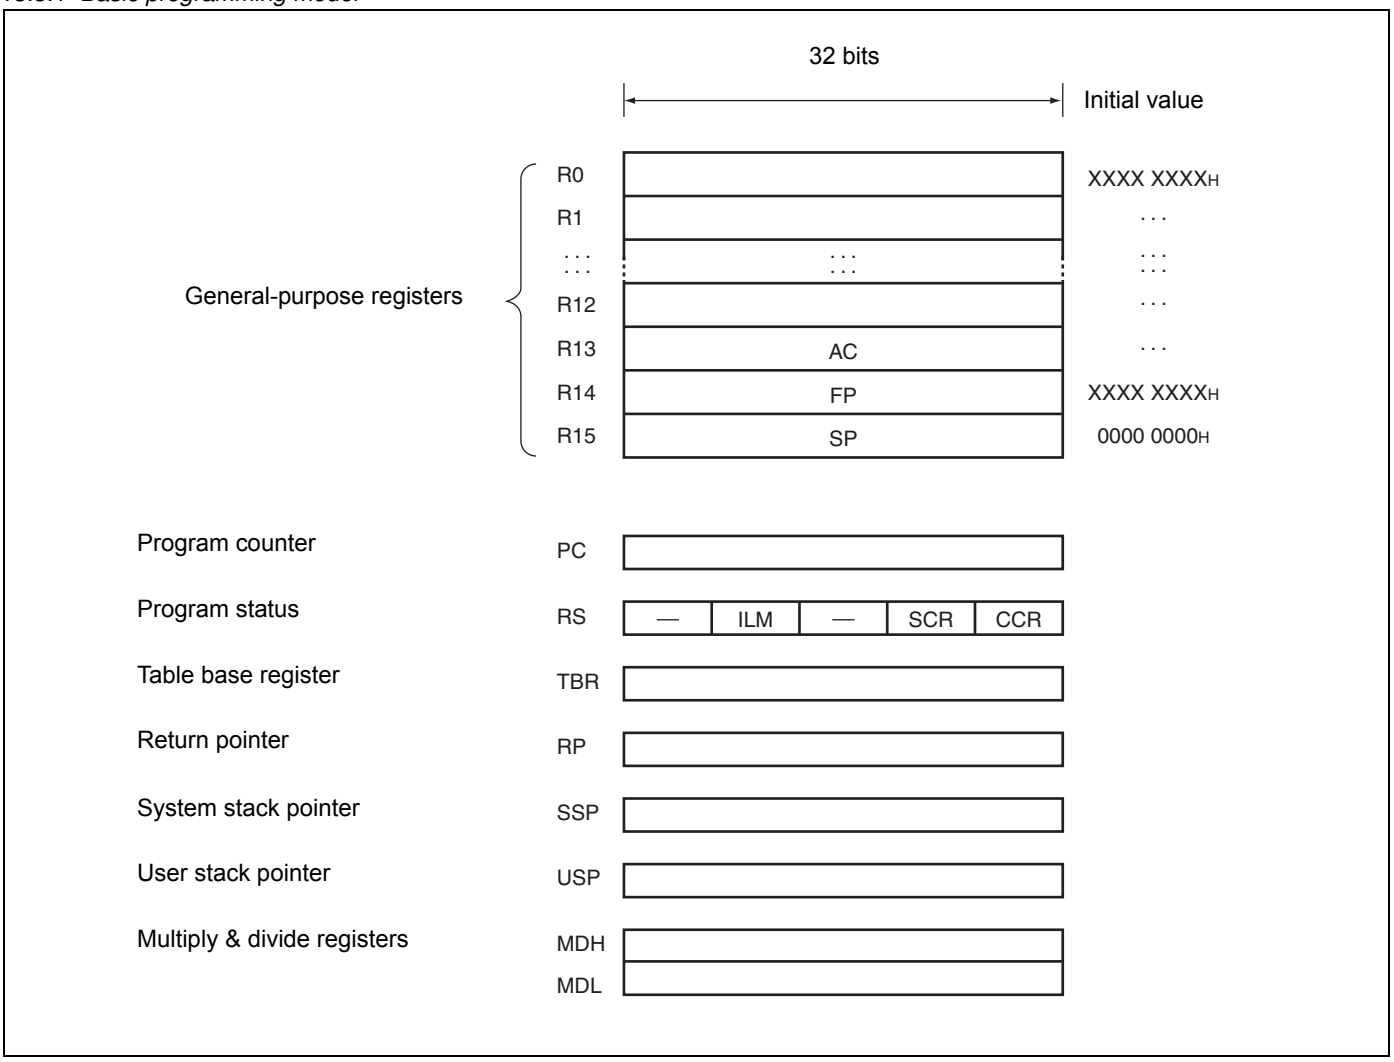
- Adoption of RISC architecture
  Basic instruction: 1 instruction per cycle
- General-purpose registers: 32-bit × 16 registers
- 4 Gbytes linear memory space
- Multiplier installed
  32-bit × 32-bit multiplication: 5 cycles
  16-bit × 16-bit multiplication: 3 cycles
- Enhanced interrupt processing function
  Quick response speed (6 cycles)
  Multiple-interrupt support
  Level mask function (16 levels)
- Enhanced instructions for I/O operation
  Memory-to-memory transfer instruction
  Bit processing instruction
  Basic instruction word length: 16 bits
- Low-power consumption
  Sleep mode/stop mode

13.2 Internal architecture

- The FR family CPU uses the Harvard architecture in which the instruction bus and data bus are independent of each other.
- A 32-bit ↔ 16-bit buffer is connected to the 32-bit bus (D-bus) to provide an interface between the CPU and peripheral resources.
- A Harvard ↔ Princeton bus converter is connected to both the I-bus and D-bus to provide an interface between the CPU and the bus controller.

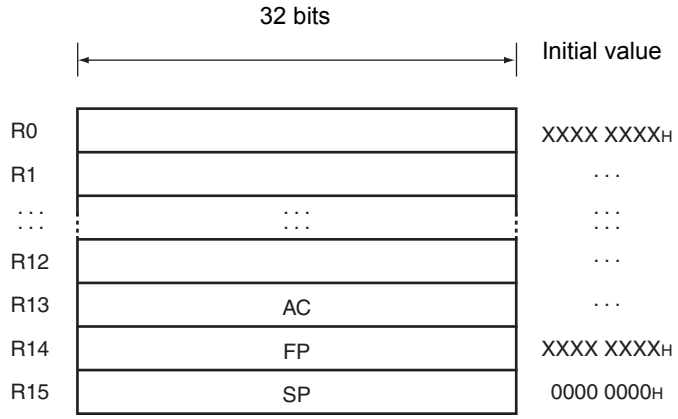
13.3 Programming model

13.3.1 Basic programming model



13.4 Registers

13.4.1 General-purpose register



Registers R0 to R15 are general-purpose registers. These registers can be used as accumulators for computation operations and as pointers for memory access.

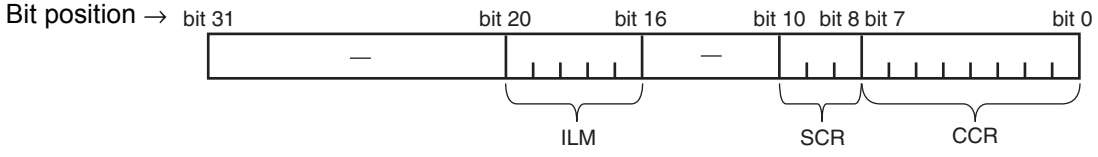
Of the 16 registers, enhanced commands are provided for the following registers to enable their use for particular applications.

R13 : Virtual accumulator
R14 : Frame pointer
R15 : Stack pointer

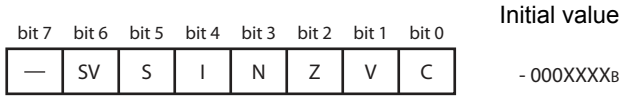
Initial values at reset are undefined for R0 to R14. The value for R15 is 00000000_H (SSP value).

13.4.2 PS (Program Status)

This register holds the program status, and is divided into three parts, ILM, SCR, and CCR.
All undefined bits (-) in the diagram are reserved bits. The read values are always “0”. Write access to these bits is invalid.

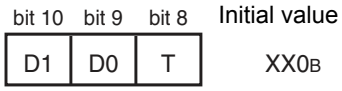


13.4.3 CCR (Condition Code Register)



SV : Supervisor flag
S : Stack flag
I : Interrupt enable flag
N : Negative enable flag
Z : Zero flag
V : Overflow flag
C : Carry flag

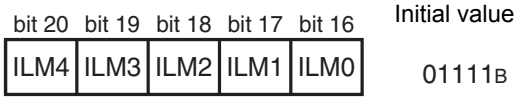
13.4.4 SCR (System Condition Register)



Flag for step division (D1, D0)
This flag stores interim data during execution of step division.

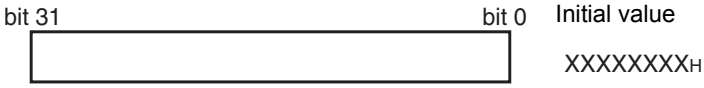
Step trace trap flag (T)
This flag indicates whether the step trace trap is enabled or disabled.
The step trace trap function is used by emulators. When an emulator is in use, it cannot be used in execution of user programs.

13.4.5 ILM (Interrupt Level Mask register)



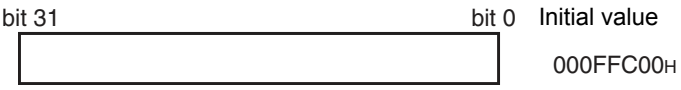
This register stores interrupt level mask values, and the values stored in ILM4 to ILM0 are used for level masking.
The register is initialized to value "01111_B" at reset.

13.4.6 PC (Program Counter)



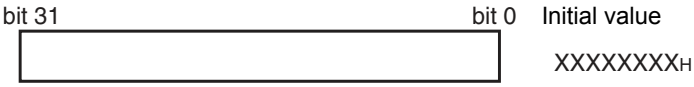
The program counter indicates the address of the instruction that is being executed.
The initial value at reset is undefined.

13.4.7 TBR (Table Base Register)



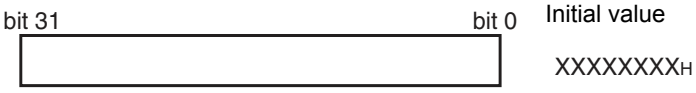
The table base register stores the starting address of the vector table used in EIT processing.
The initial value at reset is $000FFC00_H$.

13.4.8 RP (Return Pointer)



The return pointer stores the address for return from subroutines.
During execution of a CALL instruction, the PC value is transferred to this RP register.
During execution of a RET instruction, the contents of the RP register are transferred to PC.
The initial value at reset is undefined.

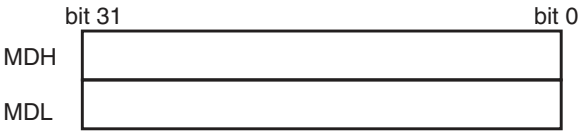
13.4.9 USP (User Stack Pointer)



The user stack pointer, when the S flag is “1”, this register functions as the R15 register.

- The USP register can also be explicitly specified.
  The initial value at reset is undefined.
- This register cannot be used with RETI instructions.

13.4.10 Multiply & divide registers



These registers are for multiplication and division, and are each 32 bits in length.
The initial value at reset is undefined.

14. Embedded Program/Data Memory (Flash)

14.1 Flash features

- CY91F465PA: 544 KBytes (8 × 64 Kbytes + 4 × 8 KBytes = 4.25 Mbits)
- CY91F467PA: 1088 KBytes (16 × 64 Kbytes + 8 × 8 KBytes = 8.5 Mbits)
- Programmable wait states for read/write access
- Flash and Boot security with security vector at 0x0014:8000 - 0x0014:800F
- Boot security
- Basic specification: Same as MBM29LV400TC (except size and part of sector configuration)

14.2 Operation modes:

1. 64-bit CPU mode (available on CY91F467PA only) :
   - CPU reads and executes programs in word (32-bit) length units.
   - Flash writing is not possible.
   - Actual Flash Memory access is performed in d-word (64-bit) length units.
2. 32-bit CPU mode:
   - CPU reads and executes programs in word (32-bit) length units.
   - Actual Flash Memory access is performed in word (32-bit) length units.
3. 16-bit CPU mode:
   - CPU reads and writes in half-word (16-bit) length units.
   - Program execution from the Flash is not possible.
   - Actual Flash Memory access is performed in word (16-bit) length units.

Note: The operation mode of the flash memory can be selected using a Boot-ROM function. The function start address is 0xBF60. The parameter description is given in the Hardware Manual in chapter 54.6 “Flash Access Mode Switching”.

14.3 Flash access in CPU mode

14.3.1 Flash configuration

Flash memory map CY91F465PA

14.3.2 Flash access timing settings in CPU mode

The following tables list all settings for a given maximum Core Frequency (through the setting of CLKB or maximum clock modulation) for Flash read and write access.

Flash read timing settings (synchronous read)

Core clock (CLKB)	ATD	ALEH	EQ	WEXH	WTC	Remark
to 24 MHz	0	0	0	-	1	
to 48 MHz	0	0	1	-	2	
to 100 MHz	1	1	3	-	4	

Flash write timing settings (synchronous write)

Core clock (CLKB)	ATD	ALEH	EQ	WEXH	WTC	Remark
to 16 MHz	0	-	-	0	3	
to 32 MHz	0	-	-	0	4	
to 48 MHz	0	-	-	0	5	
to 64 MHz	1	-	-	0	6	
to 96 MHz	1	-	-	0	7	
to 100 MHz	1	-	-	1	8	

14.3.3 Address mapping from CPU to parallel programming mode

The following tables show the calculation from CPU addresses to flash macro addresses which are used in parallel programming.

Address mapping CY91F465PA

CPU Address (addr)	Condition	Flash sectors	FA (flash address) Calculation
14:8000h to 14:FFFFh	addr[2]==0	SA4, SA6 (8 Kbyte)	FA := addr - addr%00:4000h + (addr%00:4000h)/2 - (addr/2)%4 + addr%4 - 0D:0000h
14:8000h to 14:FFFFh	addr[2]==1	SA5, SA7 (8 Kbyte)	FA := addr - addr%00:4000h + (addr%00:4000h)/2 + 00:2000h - (addr/2)%4 + addr%4 - 0D:0000h
08:0000h to 13F:FFFFh	addr[2]==0	SA12, SA14, SA16, SA18 (64 Kbyte)	FA := addr - addr%02:0000 + (addr%02:0000h)/2 - (addr/2)%4 + addr%4
08:0000h to 13F:FFFFh	addr[2]==1	SA13, SA15, SA17, SA19 (64 Kbyte)	FA := addr - addr%02:0000h + (addr%02:0000h)/2 + 01:0000h - (addr/2)%4 + addr%4

Note: FA result is without 10:0000h offset for parallel Flash programming.
Set offset by keeping FA[20] = 1 as described in section “Parallel Flash programming mode”.

Address mapping CY91F467PA

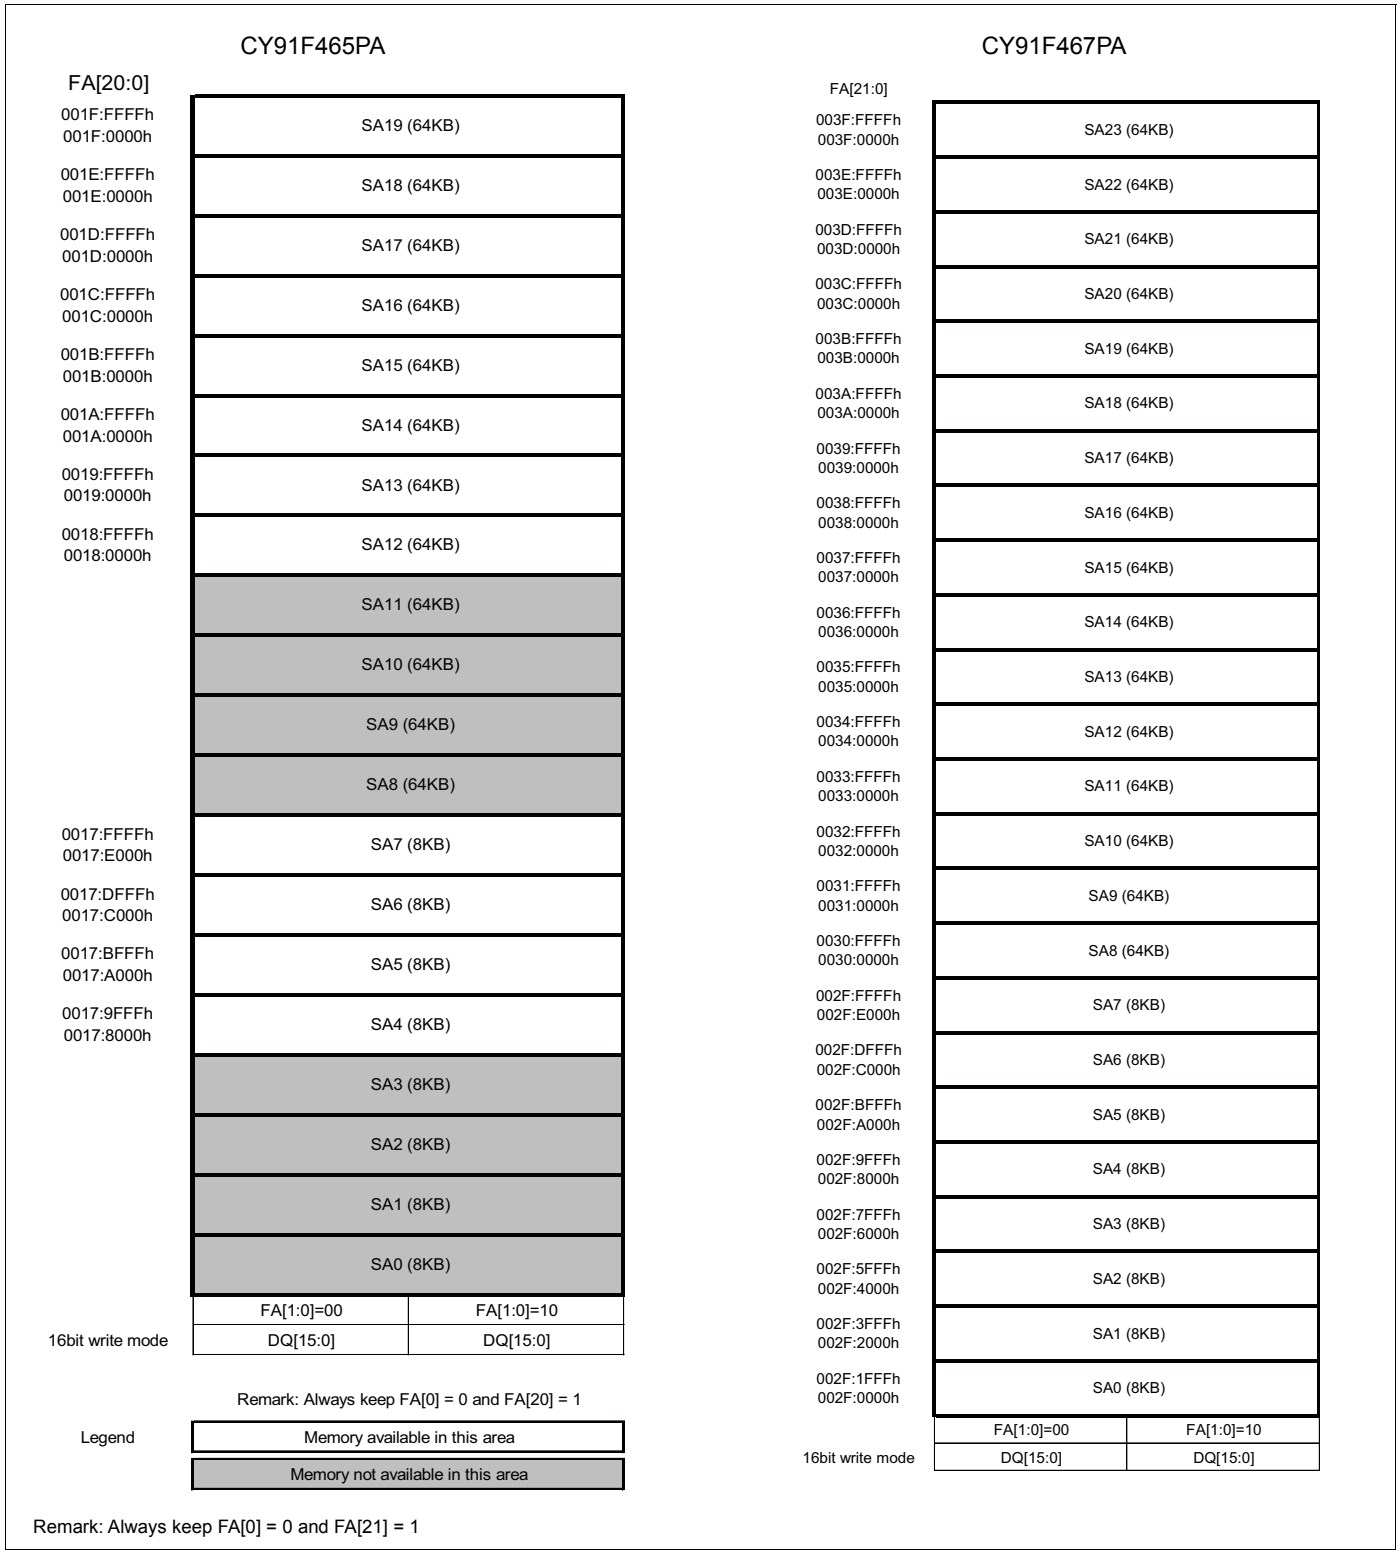
CPU Address (addr)	Condition	Flash sectors	FA (flash address) Calculation
14:0000h to 14:FFFFh	addr[2]==0	SA0, SA2, SA4, SA6 (8 Kbyte)	FA := addr - addr%00:4000h + (addr%00:4000h)/2 - (addr/2)%4 + addr%4 - 05:0000h
14:0000h to 14:FFFFh	addr[2]==1	SA1, SA3, SA5, SA7 (8 Kbyte)	FA := addr - addr%00:4000h + (addr%00:4000h)/2 - (addr/2)%4 + addr%4 - 05:0000h + 00:2000h
04:0000h to 13:FFFFh	addr[2]==0	SA8, SA10, SA12, SA14, SA16, SA18, SA20, SA22 (64 Kbyte)	FA := addr - addr%02:0000 + (addr%02:0000h)/2 - (addr/2)%4 + addr%4 + 0C:0000h
04:0000h to 13:FFFFh	addr[2]==1	SA9, SA11, SA13, SA15, SA17, SA19, SA21, SA23 (64 Kbyte)	FA := addr - addr%02:0000h + (addr%02:0000h)/2 - (addr/2)%4 + addr%4 + 0C:0000h + 01:0000h

Note: FA result is without 20:0000h offset for parallel Flash programming.
Set offset by keeping FA[21] = 1 as described in section “Parallel Flash programming mode”.

14.4 Parallel Flash programming mode

14.4.1 Flash configuration in parallel Flash programming mode

Parallel Flash programming mode (MD[2:0] = 111):



14.4.2 Pin connections in parallel programming mode

Resetting after setting the MD[2:0] pins to [111] will halt CPU functioning. At this time, the Flash memory's interface circuit enables direct control of the Flash memory unit from external pins by directly linking some of the signals to GP-Ports. Please see table below for signal mapping.

In this mode, the Flash memory appears to the external pins as a stand-alone unit. This mode is generally set when writing/erasing using the parallel Flash programmer. In this mode, all operations of the 8.5 Mbits Flash memory's Auto Algorithms are available.

Correspondence between MBM29LV400TC and Flash Memory Control Signals

MBM29LV400TCExternal pins	FR-CPU mode	CY91F465PA, CY91F467PA external pins			Comment
		Flash memory mode	Normal function	Pin number

DQ8 to DQ15		DQ8 to DQ15	P00_0 to P00_7	32 to 39	

14.5 Poweron Sequence in parallel programming mode

The flash memory can be accessed in programming mode after a certain wait time, which is needed for Security Vector fetch:

- Minimum wait time after VDD5/VDD5R power on: 2.76 ms
- Minimum wait time after INITX rising: 1.0 ms

14.6 Flash Security

14.6.1 Vector addresses

Two Flash Security Vectors (FSV1, FSV2) are located parallel to the Boot Security Vectors (BSV1, BSV2) controlling the protection functions of the Flash Security Module:

FSV1: 0x14:8000 BSV1: 0x14:8004
FSV2: 0x14:8008 BSV2: 0x14:800C

14.6.2 Security Vector FSV1

The setting of the Flash Security Vector FSV1 is responsible for the read and write protection modes and the individual write protection of the 8 Kbytes sectors.

FSV1 (bit31 to bit16)

The setting of the Flash Security Vector FSV1 bits [31:16] is responsible for the read and write protection modes.

Explanation of the bits in the Flash Security Vector FSV1[31:16]

FSV1[31:19]	FSV1[18] Write Protection Level	FSV1[17] Write Protection	FSV1[16] Read Protection	Flash Security Mode
set all to ‘0’	set to ‘0’	set to ‘0’	set to ‘1’	Read Protection (all device modes, except INTVEC mode MD[2:0]=”000”)
set all to ‘0’	set to ‘0’	set to ‘1’	set to ‘0’	Write Protection (all device modes, without exception)
set all to ‘0’	set to ‘0’	set to ‘1’	set to ‘1’	Read Protection (all device modes, except INTVEC mode MD[2:0]=”000”) and Write Protection (all device modes)
set all to ‘0’	set to ‘1’	set to ‘0’	set to ‘1’	Read Protection (all device modes, except INTVEC mode MD[2:0]=”000”)
set all to ‘0’	set to ‘1’	set to ‘1’	set to ‘0’	Write Protection (all device modes, except INTVEC mode MD[2:0]=”000”)
set all to ‘0’	set to ‘1’	set to ‘1’	set to ‘1’	Read Protection (all device modes, except INTVEC mode MD[2:0]=”000”) and Write Protection (all device modes except INTVEC mode MD[2:0]=”000”)

FSV1 (bit15 to bit0)

The setting of the Flash Security Vector FSV1 bits [15:0] is responsible for the individual write protection of the 8 Kbytes sectors. It is only evaluated if write protection bit FSV1[17] is set.

Explanation of the bits in the Flash Security Vector FSV1[15:0]

FSV1 bit	Sector	Enable Write Protection	Disable Write Protection	Comment
FSV1[0]	SA0 (CY91F467PA)	set to “0”	set to “1”	not available
FSV1[1]	SA1 (CY91F467PA)	set to “0”	set to “1”	not available
FSV1[2]	SA2 (CY91F467PA)	set to “0”	set to “1”	not available
FSV1[3]	SA3 (CY91F467PA)	set to “0”	set to “1”	not available
FSV1[4]	SA4	set to “0”	—	Write protection is mandatory!
FSV1[5]	SA5	set to “0”	set to “1”	
FSV1[6]	SA6	set to “0”	set to “1”	
FSV1[7]	SA7	set to “0”	set to “1”	
FSV1[8]	—	set to “0”	set to “1”	not available
FSV1[9]	—	set to “0”	set to “1”	not available
FSV1[10]	—	set to “0”	set to “1”	not available
FSV1[11]	—	set to “0”	set to “1”	not available
FSV1[12]	—	set to “0”	set to “1”	not available
FSV1[13]	—	set to “0”	set to “1”	not available
FSV1[14]	—	set to “0”	set to “1”	not available
FSV1[15]	—	set to “0”	set to “1”	not available

Note: It is mandatory to always set the sector where the Flash Security Vectors FSV1 and FSV2 are located to write protected (here sector SA4). Otherwise it is possible to overwrite the Security Vector to a setting where it is possible to either read out the Flash content or manipulate data by writing.
See section “Flash access in CPU mode” for an overview about the sector organization of the Flash Memory.

14.6.3 Security Vector FSV2

The setting of the Flash Security Vector FSV2 bits [31:0] is responsible for the individual write protection of the 64 kByte sectors. It is only evaluated if write protection bit FSV1[17] is set.

Explanation of the bits in the Flash Security Vector FSV2[31:0]

FSV2 bit	Sector	Enable Write Protection	Disable Write Protection	Comment
FSV2[0]	SA8 (CY91F467PA)	set to “0”	set to “1”	
FSV2[1]	SA9 (CY91F467PA)	set to “0”	set to “1”	
FSV2[2]	SA10 (CY91F467PA)	set to “0”	set to “1”	
FSV2[3]	SA11 (CY91F467PA)	set to “0”	set to “1”	
FSV2[4]	SA12	set to “0”	set to “1”	
FSV2[5]	SA13	set to “0”	set to “1”	
FSV2[6]	SA14	set to “0”	set to “1”	
FSV2[7]	SA15	set to “0”	set to “1”	
FSV2[8]	SA16	set to “0”	set to “1”	
FSV2[9]	SA17	set to “0”	set to “1”	
FSV2[10]	SA18	set to “0”	set to “1”	
FSV2[11]	SA19	set to “0”	set to “1”	
FSV2[12]	SA20 (CY91F467PA)	set to “0”	set to “1”	
FSV2[13]	SA21 (CY91F467PA)	set to “0”	set to “1”	
FSV2[14]	SA22 (CY91F467PA)	set to “0”	set to “1”	
FSV2[15]	SA23 (CY91F467PA)	set to “0”	set to “1”	
FSV2[31:16]	—	set to “0”	set to “1”	not available

Note : See section “Flash access in CPU mode” for an overview about the sector organisation of the Flash Memory.

14.7 Notes About Flash Memory CRC Calculation

The Flash Security macro contains a feature to calculate the 32-bit checksum over addresses located in the Flash Memory address space. This feature is described in the CY91460 Series Hardware Manual, chapter 55.4.1 “Flash Security Control Register”.

Additional notes are given here:

The CRC calculation runs on the internal RC clock. It is recommended to switch the RC clock frequency to 2 MHz for shortening the calculation time. However, the CPU clock (CLKB) must be faster then RC clock, otherwise the CRC calculation may not start correctly.

15. Embedded Data Flash (CY91F467PA)

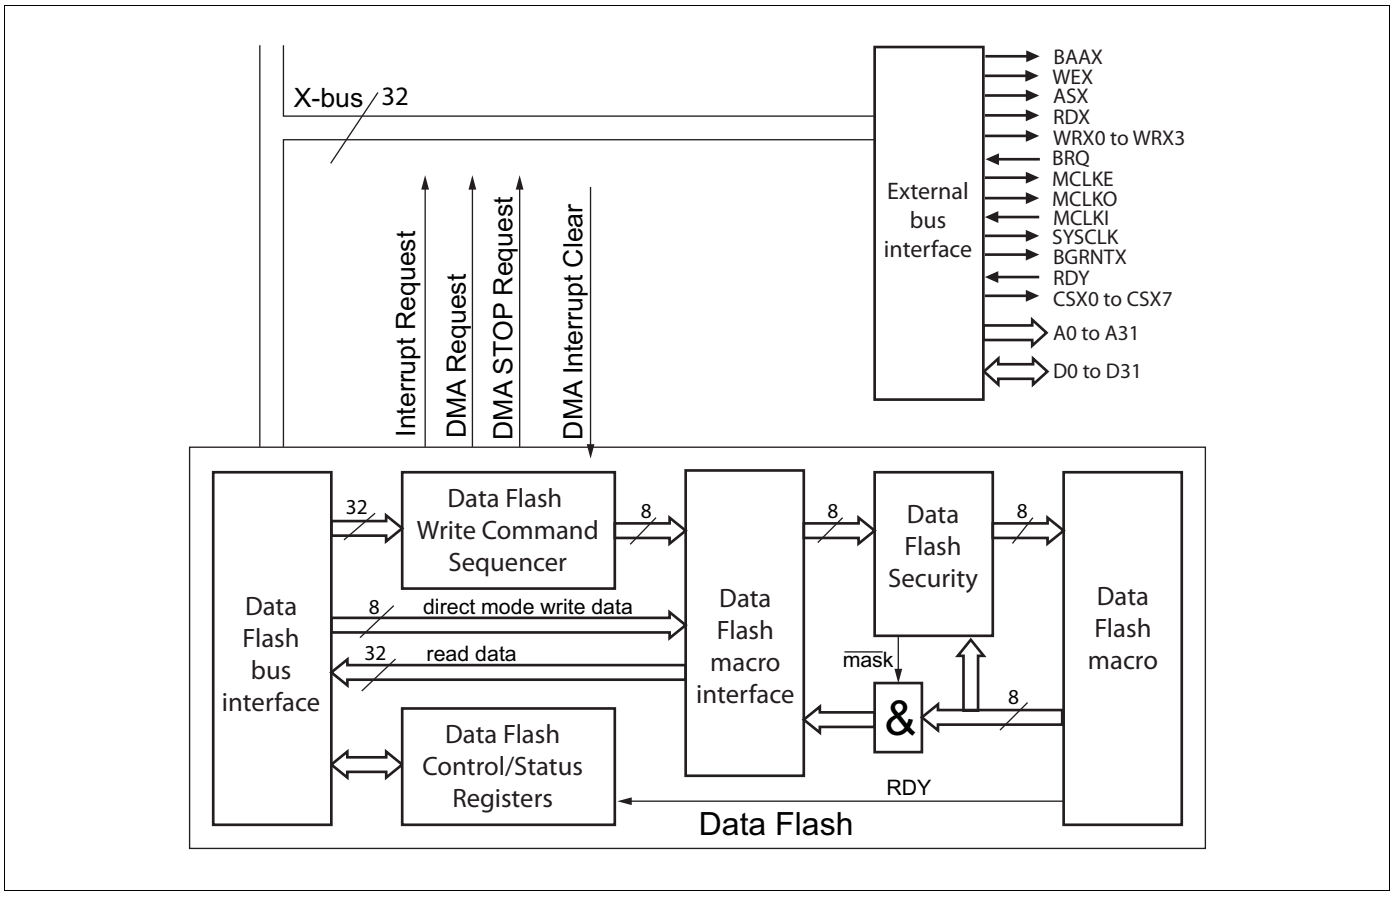
CY91F467PA contains a 64 KByte internal data flash.

15.1 Data Flash Features

- CY91F467PA: 64 Kbytes (4 × 16 Kbytes + 1 × 256 bytes security sector)
- Data width of flash macro: 8 bit
- Synchronous flash interface and flash macro
- 2 access modes (direct access, command sequencer access)
- Read access 8/16/32-bit by internal sequencer hardware
- Write access 8-bit in direct access mode, 8/16/32-bit in command sequencer write mode
- Programmable wait states for read/write access
- Data Flash Security feature (read and write protection)
- CRC calculation feature
- Interrupt- and DMA request, DMA stop request

15.2 Data Flash Block Diagram

The Data Flash consists of the flash macro and interface, control, status, command sequencer and security logic. On CY91460 series devices, the Data Flash is connected to the X-Bus in parallel to the External Bus interface:



15.3 Data Flash Operation Modes

The data flash is located in the top address space of external bus area. Per **default** (after software reset RST), the data flash is **disabled** and does not accept any read/write access. The data flash can be enabled by setting the bit DFCS:FLASHEN (DFCS is the Data Flash Control/Status register).

15.3.1 Direct Access mode:

The Direct Access mode provides data flash access similar to the access of the embedded program/data flash (main flash). For write/program operations, the flash command sequences must be written by the CPU. The command sequences are the same as used for the embedded program/data flash (main flash).

- CPU reads data in byte, halfword or word (8/16/32-bit) length units, whereas 16- or 32-bit read operations are split into 2 or 4 sequential 8-bit flash macro read accesses by hardware.
- CPU writes data in byte (8-bit) width units.
- For write/program operations, the flash command sequences must be written by the CPU.
- The flash macro auto algorithms (Chip Erase, Sector Erase, Sector Erase Suspend,...) can only be activated in direct access mode.
- Direct access mode is the default mode after software reset (RST).

15.3.2 Command Sequencer Mode:

In command sequencer mode, the flash macro command sequences for data write operation are generated by hardware.

- CPU reads data in byte, halfword or word (8/16/32-bit) length units (same as in direct access mode).
- CPU writes data in byte, halfword or word (8/16/32-bit) length units using normal “store” instructions. The flash macro command sequences are generated by internal command sequencer hardware. For 16- or 32-bit write, 2 or 4 command sequences are generated, respectively.
- The data flash interface will not issue wait states after a command sequencer write operation was started. The CPU can continue working during data flash programming.
- If a command sequencer write operation is ongoing, and the CPU writes data again, this second write request is ignored! The error flag DFWS:PAERF is set in case of such a prohibited access. It is recommended to use the data flash interrupts, which indicate that the proceeding write sequence was finished and successful.
- If a command sequencer write operation is ongoing, and the CPU tries to read data, 0x00 is returned and the error flag DFWS:PAERF is set.
- The flash macro auto algorithms (Chip Erase, Sector Erase, Sector Erase Suspend,...) cannot be activated.
- Command Sequencer mode is enabled by setting the bit DFWC:WE (Data Flash Write Control register).
- After software reset (RST), the command sequencer mode is disabled.

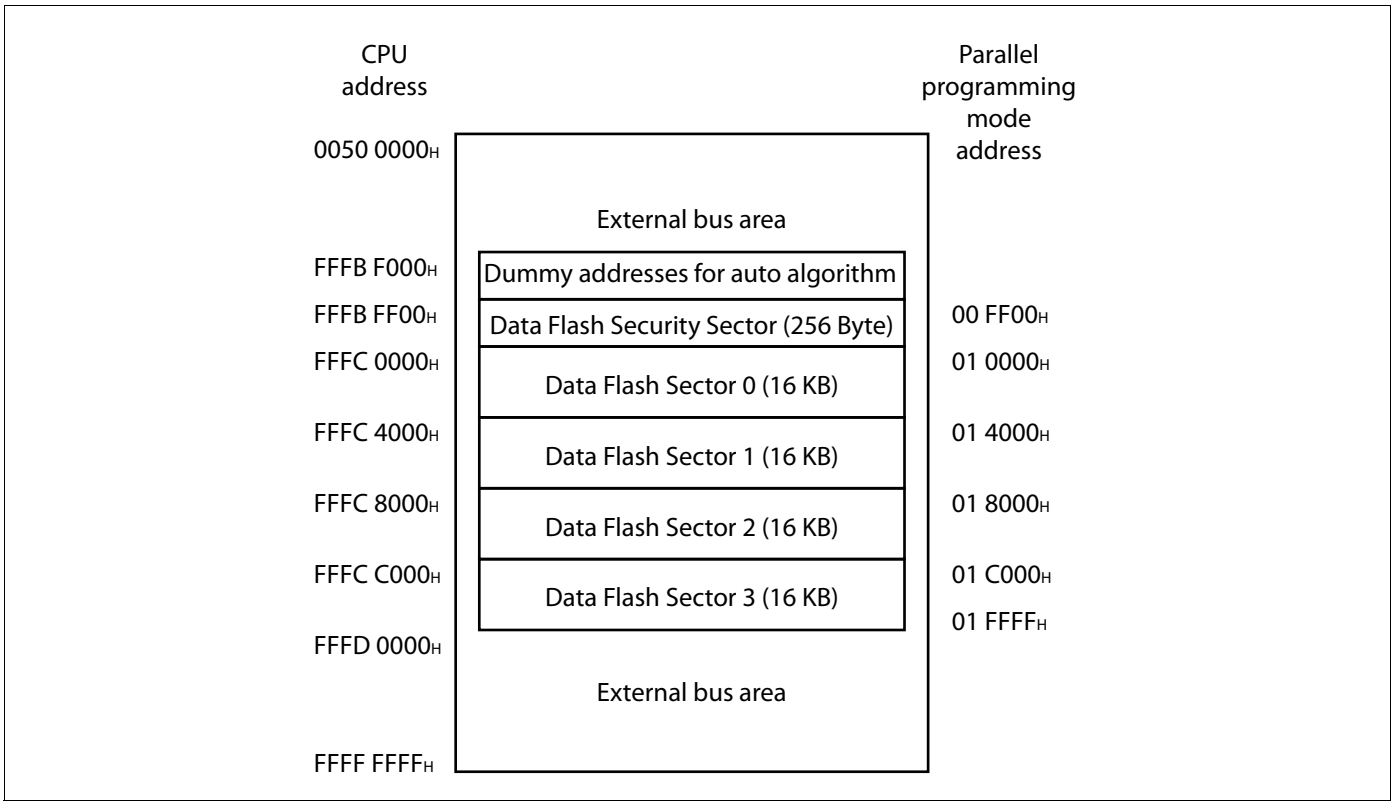
15.3.3 Parallel Programming mode:

- The parallel programming mode works similar to the main flash memory. The function/timing of some external control lines are different.
- In parallel programming mode, it is not necessary to set the Data Flash enable bit (DFCS:FLASHEN).
- Data Flash Memory access is performed in byte (8-bit) length units.

15.4 Data Flash access in CPU mode

15.4.1 Data Flash memory map CY91F467PA

The Data Flash macro is 8 bit wide. It is located in the top address space of external bus area:



Note: The address in parallel programming mode is listed here without 10:0000h offset.
Set the offset by keeping FA[22:20] = 001 the same kind as used for programming of the main flash.

Note: The “Dummy addresses for auto algorithm” are accepted although they are located below the physical addresses of the flash macro. This address space is needed to apply correct addresses in auto algorithms.
See the example in 15.4.4“Auto Program Algorithms”. However, toggle flags cannot be read using the dummy addresses.

15.4.2 Data Flash and External Bus

If the Data Flash is disabled (see 15.3“Data Flash Operation Modes”), the complete address space can be used for the external bus.

If the Data Flash is enabled, the user should take care that no external bus chip select area overlaps the address range of the Data Flash.

If a chip select area overlaps the Data Flash addresses, the following scenario may appear:

- Write operations will be sent to data flash and external bus in parallel. This may cause heavy problems, especially if the data flash is written in direct mode, where the CPU sends the command sequences for programming (see 15.3.1“Direct Access mode:”).
- Read operations will return unpredictable results.

15.4.3 Flash access timing settings in CPU mode

The Data Flash can be accessed up to CLKB = 100 MHz. For timing and wait state setup, please refer to the description of the bits TMG2, TMG1, TMG0 in 15.5.1“Data Flash Control and Status Register”.

Although the data flash is located in the address space of external bus, there is no dependency between external bus timing and data flash timing.

15.4.4 Auto Program Algorithms

The auto program algorithms can only be applied in direct access mode, while the “Program” sequence can be generated by hardware if the Command Sequencer Mode is used.
The data flash supports command sequences similar to the main flash:

Command Sequence	Bus Write Cycle	1st bus Write cycle		2nd bus Write cycle		3rd bus Write cycle		4th bus Write cycle		5th bus Write cycle		6th bus Write cycle	
		Address	Data	Address	Data	Address	Data			Address	Data	Address	Data
Read/Reset	1	XXX	F0	RA	RD								
Read/Reset	3	AA8	AA	554	55	AA8	F0	RA	RD				
Program	4	AA8	AA	554	55	AA8	A0	PA	PD				
Chip Erase	6	AA8	AA	554	55	AA8	80	AA8	AA	554	55	AA8	10
Sector Erase	6	AA8	AA	554	55	AA8	80	AA8	AA	554	55	SA	30
Sector Erase Suspend	Sector Erase Suspend by input of address “XXX" and data “B0”												
Sector Erase Resume	Sector Erase Resume by input of address “XXX" and data “30”												
Unlock Bypass set	3	AA8	AA	554	55	AA8	20						
Unlock Bypass program	2	XXX	A0	PA	PD								
Unlock Bypass Reset	2	XXX	90	XXX	F0/ 00								

PA: Program Address
PD: Program Data. Data to be programmed at location PA.
RA: Read Address
RD: Data to read at location RA.
SA: Sector Address (points into the sector to be erased)

It is recommended that the addresses “AA8” and “554” point to the sector which is to be programmed.
For **example**, to program a byte into sector SAS, the following sequence should be used:

AddressPA=0xFFFBFF83 is inside sector SAS.

1. write addr=0xFFFBFAA8 data=0xAA
2. write addr=0xFFFBF554 data=0x55
3. write addr=0xFFFBFAA8 data=0xA0
4. write addr=0xFFFBFF83 =PA data=PD

Note: The address for the write sequence (1., 2., 3. write) points into the “Dummy addresses for auto algorithm” here. For polling of toggle bits, an address pointing inside the programmed sector has to be used, for example the programmed address (PA) itself.

15.4.5 Data Flash Hardware Sequence Flags (Toggle Bits)

In direct access mode, the data flash returns toggle bits shown in the following table.
In command sequencer mode, it is not necessary to read the toggle bits because they are observed by the command sequencer automatically.

Status				DQ7	DQ6	DQ5	DQ4	DQ3	DQ2
In Progress	Embedded Program Algorithm			~DQ7	Toggle	0	0	0	1
	Embedded Erase Algorithm (Erase Suspended Sector)	Busy to suspend		0	Toggle	0	1	1	Toggle
		Ready to suspend					0		
	Embedded Erase Algorithm (Non-Erase Suspended Sector)		Busy to suspend	0	Toggle	0	1	1	1
			Ready to suspend				0		
	Erase Suspended Mode	Erase Suspend Read (Erase Suspended Sector)		1	1	0	0	0	Toggle
		Erase Suspend Read (Non-Erase Suspended Sector)		Data	Data	Data	Data	Data	Data
		Erase Suspend Program (Non-Erase Suspended Sector)		~DQ7	Toggle	0	0	0	1
Exceeded Time Limits	Embedded Program Algorithm			~DQ7	Toggle	1	0	0	1
	Embedded Erase Algorithm			0	Toggle	1	N/A	1	N/A
	Erase Suspended Mode	Erase Suspend Program (Non-Erase Suspended Sector)		~DQ7	Toggle	1	0	0	N/A

Note: For polling of toggle bits, an address pointing inside the programmed sector has to be used, for example the programmed address itself. Do not use a “Dummy addresses for auto algorithm”.

15.5 Data Flash Registers

The Data Flash has the following control/status registers:

DFCS : Data Flash Control and Status Register

Address	31	30	29	28	27	26	25	24	bit
07114_H	RDYI	TMG2	TMG1	TMG0	FLASHEN	INTE	RDYINT	RDY	
	0	1	1	1	0	0	0	1	Initial value
	R/W	R/W	R/W	R/W	R/W	R/W	R/W0	R	Attribute

DFWC : Data Flash Write Command Sequencer Control Register

Address	23	22	21	20	19	18	17	16	bit
07115_H	-	-	-	ERINTE	FININTE	IDLINTE	IDLDMAE	WE	
	x	x	x	0	0	0	0	0	Initial value
	-	-	-	R/W	R/W	R/W	R/W	R/W	Attribute

DFWS : Data Flash Write Command Sequencer Status Register

Address	15	14	13	12	11	10	9	8	bit
07116_H	PAERF	WIERINT	WERINT	TOERINT	FININT	IDLINT	ST1	ST0	
	0	0	0	0	0	0	0	0	Initial value
	R/W0	R/W0	R/W0	R/W0	R/W0	R/W0	R	R	Attribute

DFSCR0 : Data Flash Security Control Register 0

Address	31:24	23:16	15:8	7:0	bit
07118_H	DFSCR0[31:0]				
	1111 1111	1111 1111	1111 1111	1111 1111	Initial value
	R/W, R	R	R	R	Attribute

DFSCR1 : Data Flash Security Control Register 1

Address	31:24	23:16	15:8	7:0	bit
$0711C_H$	DFSCR1[31:0]				
	0 - - - 0001	0000 0000	0000 0000	0000 0000	Initial value
	R, R/W	R, R/W	R, R/W	R, R/W	Attribute

15.5.1 Data Flash Control and Status Register

This section explains the Data Flash Control and Status register.

DFCS : Data Flash Control and Status register

Addr: 0x07114

31	30	29	28	27	26	25	24	bit
RDYI	TMG2	TMG1	TMG0	FLASHEN	INTE	RDYINT	RDY	
0	1	1	1	0	0	0	1	initial
R/W	R/W	R/W	R/W	R/W	R/W	R/W0	R	attribute

RDYI	Ready Inversion
0	(default) Normal flash operation
1	Setting this bit to ’1’ activates the RDYI input of the Flash. As a result, the RDY output of the Flash goes to ’0’ (used for test purposes only). Always write 0 to this bit.

- This bit is cleared by software reset (RST).
- Always write 0 to this bit.

TMG2	TMG1	TMG0	Data Flash Timing Control		
			CLKB Frequency up to	CLKB Cycles per Read Operation	CLKB Cycles per Write Operation
0	0	0	6.2 MHz	3	3
0	0	1	16.7 MHz	4	3
0	1	0	33.3 MHz	5	3
0	1	1	50 MHz	6	3
1	0	0	66.6 MHz	8	4
1	0	1	83.3 MHz	9	5
1	1	0	100 MHz	10	6
1	1	1	(default) 100 MHz	11	6

- These bits control the number of wait cycles for read and write operations.
- The bits are set to “111” by software reset (RST) and can be read and written

FLASHEN	Data Flash Enable
0	(default) Data Flash is disabled and does not accept read and write access
1	Data Flash is enabled and can be read and written depending on data flash security settings.

- This bit is cleared by software reset (RST) and can be read and written
- Before setting this bit, the user has to take care that no External Bus Chip Select area overlaps the data flash address space.

INTE	Ready Interrupt Enable
0	(default) Disable the interrupt of the RDYINT flag
1	Enable the interrupt of the RDYINT flag

- If this bit is cleared, no interrupt is generated when the RDYINT flag is set.
- If this bit is set, the interrupt by RDYINT flag is enabled.
- This bit is cleared by software reset (RST) and can be read and written.

RDYINT	Ready Interrupt Flag
0	(default) The flash macro has not entered the READY state
1	The flash macro has entered the READY state

- This bit is set after a rising edge of the RDY status line of the flash macro.
- This bit is cleared by software reset (RST) or by writing 0. Writing 1 has no effect.
- Read-modify-write operations will read 1.

RDY	Flash Macro Ready Status
0	Indicates that a program/erase command is currently executed. Only the reset and suspend commands are accepted in this state.
1	(default) Indicates that no program/erase command is currently executed. Any command can be written to the Flash.

- This bit shows the RDY status line of the flash macro after a certain response time t_{BUSY}:
  In direct access mode, t_{BUSY} is minimum 90 ns after the last write access of a program sequence.
  In write sequencer mode, the command sequencer cares about RDY signal. There is no need to poll RDY.
- This bit is read-only.

15.5.2 Data Flash Write Command Sequencer Control Register

This section explaines the Data Flash Sequencer Control register

DFWC : Data Flash Write Command Sequencer Control

Addr: 0x07115

23	22	21	20	19	18	17	16	bit
-	-	-	ERINTE	FININTE	IDLINTE	IDLDMAE	WE	
x	x	x	0	0	0	0	0	initial
-	-	-	R/W	R/W	R/W	R/W	R/W	attribute

- Always write 0 to the bits 7:5.

ERINTE	Error Interrupt Enable
0	(default) Disable the interrupt of the error flags
1	Enable the interrupt of the error flag

- If this bit is cleared, no interrupt is generated when a error flag (TOERINT, WERINT and WIERINT) is set.
- If this bit is set, an interrupt is generated when one of the error flags is set.
- This bit is cleared by software reset (RST) and can be read and written.

FININTE	Finish Interrupt Enable
0	(default) Disable the interrupt of the FININT flag
1	Enable the interrupt of the FININT flag

- If this bit is cleared, no interrupt is generated when the FININT flag is set.
- If this bit is set, an interrupt is generated when the FININT flag is set.
- This bit is cleared by software reset (RST) and can be read and written.

IDLINTE	Idle Interrupt Enable
0	(default) Disable the interrupt of the IDLINT flag
1	Enable the interrupt of the IDLINT flag

- If this bit is cleared, no interrupt is generated when the IDLINT flag is set.
- If this bit is set, an interrupt is generated when the IDLINT flag is set.
- This bit is cleared by software reset (RST) and can be read and written.

IDLDMAE	Idle DMA Enable
0	(default) Disable the DMA transfer request
1	Enable the DMA transfer request if the IDLINT flag is set

- If this bit is cleared, no DMA transfer request is generated when the IDLINT flag is set.
- If this bit is set, an DMA transfer request is generated when the IDLINT flag is set.
- This bit is cleared by software reset (RST) and can be read and written.

WE	Write Command Sequencer Enable
0	(default) Disable the Write Command Sequencer, Data Flash operates in direct mode
1	Enable the Write Command Sequencer Mode

- This bit enables the Command Sequencer mode.
- This bit is cleared by software reset (RST) and can be read and written.

15.5.3 Data Flash Write Command Sequencer Status Register

This section explaines the Data Flash Command Sequencer Status register.

DFWS : Data Flash Write Command Sequencer Status

Addr: 0x07116

15	14	13	12	11	10	9	8	bit
PAERF	WIERINT	WERINT	TOERINT	FININT	IDLINT	ST1	ST0	
0	0	0	0	0	0	0	0	initial
R/W0	R/W0	R/W0	R/W0	R/W0	R/W0	R	R	attribute

The command sequencer status flags are only set if the command sequencer is enabled (DFWC:WE=1).

PAERF	Prohibited Access Error Flag
0	(default) No prohibited access detected
1	Prohibited access detected

- This flag is set if the CPU tried to read or write into the Data Flash area while the Data Flash is accessed by the Command Sequencer.
- This flag cannot generate an interrupt.
- This bit is cleared by software reset (RST) or by writing 0. Writing 1 has no effect.
- Read-modify-write operations will read 1.

WIERINT	Write Incomplete Error Flag
0	(default) Command sequencer write operation was completed
1	Command sequencer was disabled while a write operation was ongoing

- This flag is set when the command sequencer is disabled (set DFWC:WE=0) in “not idle” state.
- If this flag is 0, it is no guarantee that the write operation was successful. Use the FININT flag!
- This flag can generate an interrupt if DFWC:ERINTE is set.
- This bit is cleared by software reset (RST) or by writing 0. Writing 1 has no effect.
- Read-modify-write operations will read 1.

WERINT	Write Error Flag
0	(default) No write error detected
1	Write operation returned error

- This flag is set after a write access returned error:
  - tried to write to an erase-suspended or write-protected sector,
  - tried to write a bit “1” although it is already “0” in flash.
- This flag can generate an interrupt if DFWC:ERINTE is set.
- This bit is cleared by software reset (RST) or by writing 0. Writing 1 has no effect.
- Read-modify-write operations will read 1.

TOERINT	Timeout Error Flag
0	(default) No timeout error detected
1	A write operation ended with timeout error

- This flag is set after a write operation ended in timeout state.
- This flag can generate an interrupt if DFWC:ERINTE is set.
- This bit is cleared by software reset (RST) or by writing 0. Writing 1 has no effect.
- Read-modify-write operations will read 1.

FININT	Command Sequence Finished Flag
0	(default) Write command was not (yet) finished successfully
1	Write command was finished successfully

- This flag is set after a command sequencer write operation was finished successfully.
- This flag can generate an interrupt if DFWC:FININTE is set.
- This bit is cleared by software reset (RST) or by writing 0. Writing 1 has no effect.
- This bit is also cleared after a DMA transfer (caused by IDLINT) was finished.
- Read-modify-write operations will read 1.

IDLINT	Command Sequencer Idle Flag
0	(default) Command sequencer is disabled or not in IDLE state
1	Command sequencer entered the IDLE state

- This flag is set after the command sequencer was enabled (set DFWC:WE=1) or entered the IDLE state after a write operation was finished.
- This flag can generate an interrupt if DFWC:INTE is set.
- This flag can generate a DMA transfer request if DFWC:IDLDMAE is set.
- This bit is cleared by software reset (RST) or by writing 0. Writing 1 has no effect.
- This bit is also cleared after a DMA transfer was finished.
- Read-modify-write operations will read 1.

ST1	ST0	Command Sequencer Status Flags
0	0	(default) Command sequencer is disabled or in IDLE state
0	1	Command sequencer is submitting the write command
1	0	Command sequencer is waiting for Flash program finish
1	1	Command sequencer was disabled in "not idle" state

- Status bit {ST1,ST0} =2'b11 show that the command sequencer was disabled in "not idle" state and direct access to Flash is not yet permitted (wait for proceeding Flash sequence to finish). Max duration of this wait can be 11 clock cycle after disabling Command Sequencer.

15.5.4 Data Flash security Control Register 0,1

Please refer to 15.8.5"Data Flash Security Registers".

15.6 Data Flash Interrupts and DMA Access

If a command sequencer write operation is ongoing, and the CPU writes data again, this second write request is ignored! Therefore, it is recommended to use the data flash interrupts or DMA, which indicates that the write sequence is finished and successful.

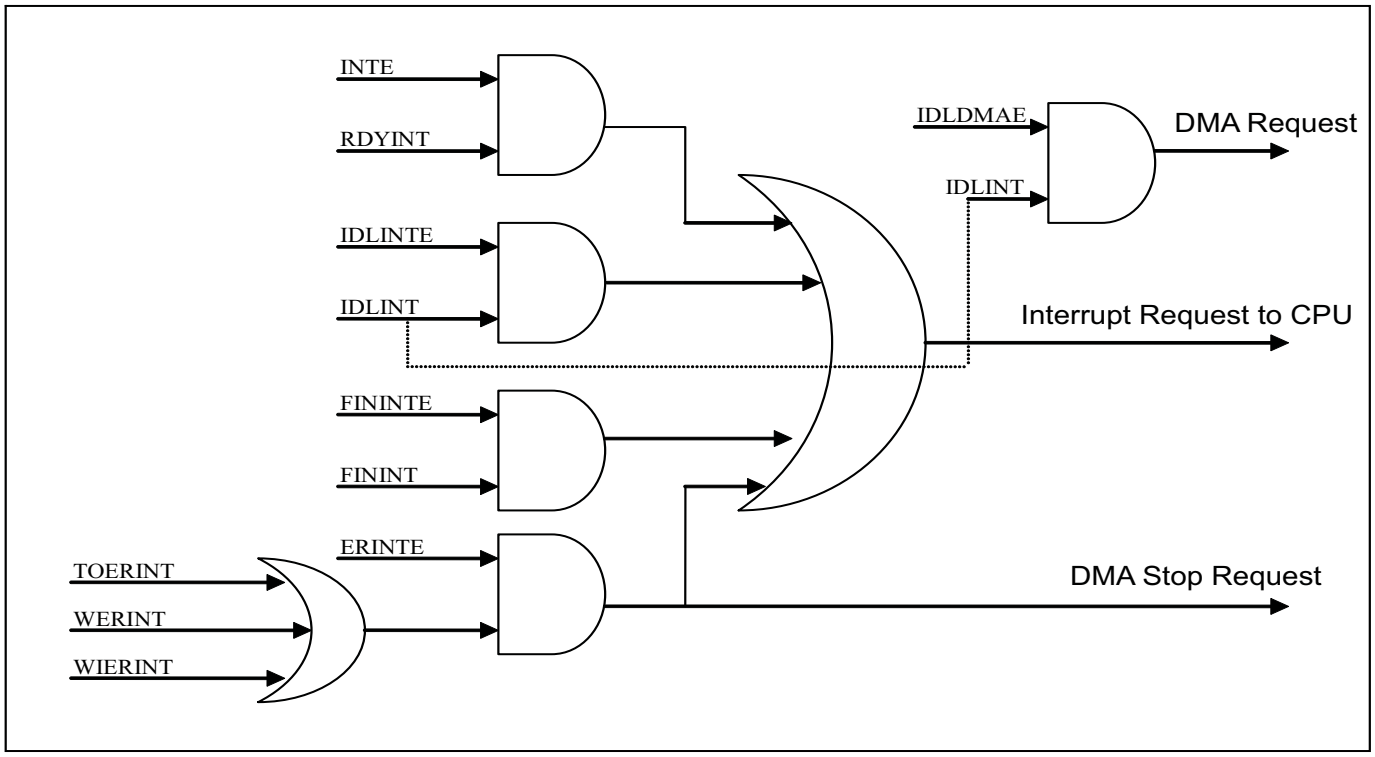
15.6.1 Data Flash Interrupt Flag Overview

The Data Flash interface has 6 interrupt flags with certain relationship to the 3 output lines for interrupt / DMA request:

Interrupt Flags:

- IDLINT — IDLE flag, indicates that the command sequencer has entered the IDLE state after a write sequence. This flag is also set just after the command sequencer was enabled by setting DFWC:WE.
- RDYINT — READY flag, indicates that the flash macro has entered READY state.
- FININT — FINISH flag, indicates that the command sequencer finished a write sequence successfully.
- TOERINT — TIMEOUT Error flag, indicates that a command sequencer write sequence ended in TIMEOUT error state.
- WERINT — Suspend Sector Write Error flag, indicates that there was a write request to a sector which is erase suspended or write-protected and not ready for writing.
- WIERINT — Write Incomplete Error flag, indicates that the command sequencer was disabled (DFWC:WE = 0) while a write sequence was ongoing.
- PAERF — Prohibited Access Error flag, indicates that the CPU tried a read or write access while a command sequencer write was ongoing. PAERF is a status flag and cannot generate an interrupt.

The following picture shows the interrupt flags and their enable bits.



The DMA request can be activated by the IDLE flag only and has a separate enable bit (DFWC:IDLDMAE).
DMA Stop request is activated by the error flags.

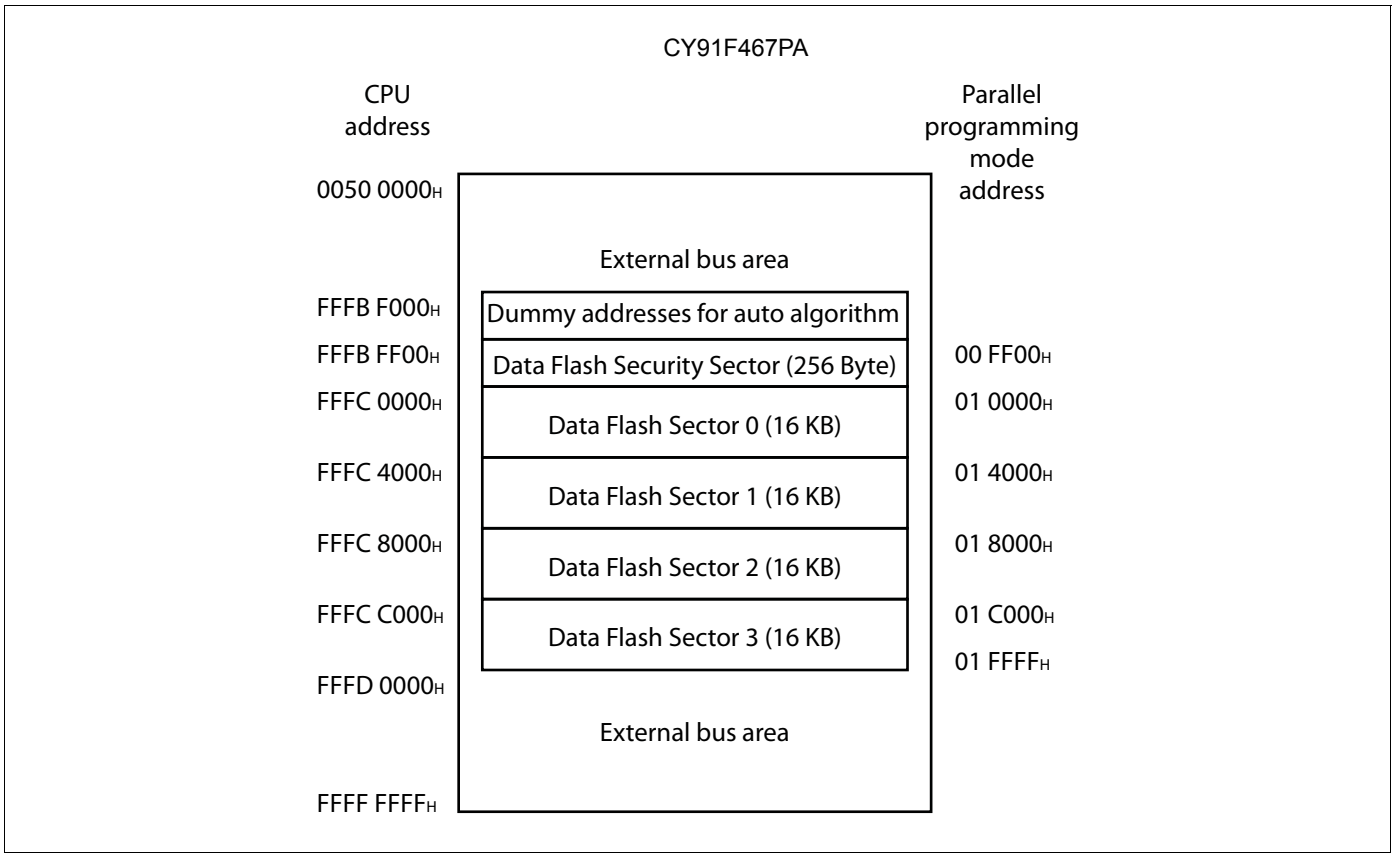
The CPU interrupt can be activated by all interrupt flags.

15.7 Data Flash parallel programming mode

Note: The currently available parallel flash programmers do not support the programming of the data flash. The programmers may be updated on request. This chapter is for information only.

15.7.1 Flash configuration in parallel Flash programming mode

Parallel Flash programming mode (MD[2:0] = 111):



Note: The address in parallel programming mode is listed here without 10:0000h offset.
Set the offset by keeping FA[22:20] = 001 the same kind as used for programming of the main flash.

Note: The “Dummy addresses for auto algorithm” are accepted although they are located below the physical addresses of the flash macro. This address space is needed to apply correct addresses in auto algorithms.
See the example in 15.4.4“Auto Program Algorithms”.

15.7.2 Address mapping from CPU to parallel programming mode

The following tables show the calculation from CPU addresses to data flash macro addresses which are used in parallel programming.

Address mapping CY91F467PA

CPU Address (addr)	Condition	Flash sectors	FA (flash address) Calculation
FFFB:FF00h to FFFC:FFFFh	-	SAS, SA0, SA1, SA2, SA3 (256 Byte + 64 Kbyte)	FA := addr - 0B:0000h

Note: FA result is without 10:0000h offset for parallel Flash programming .
Set the offset by keeping FA[22:20] = 001 the same kind as used for programming of the main flash.

15.7.3 Pin connections in parallel programming mode

Resetting after setting the MD[2:0] pins to [111] will halt CPU functioning. At this time, the Flash memory's interface circuit enables direct control of the Flash memory unit from external pins by directly linking some of the signals to General Purpose Ports. Please see table below for signal mapping.

In this mode, the Data Flash memory appears to the external pins as a stand-alone unit. This mode is generally set when writing/erasing using the parallel Flash programmer. In this mode, all operations of the Data Flash memory's Auto Algorithms are available.

Correspondence between flash macro and Flash Memory Control Signasl

Data Flash macro pins	FR-CPU mode	**CY91F467PA** external pins			Comment
—	INITX	—	INITX	104	
FRSTX	—	FRSTX	NMIX	105	
—	—	MD_2	MD_2	96	Set to '1'
—	—	MD_1	MD_1	95	Set to '1'
—	—	MD_0	MD_0	94	Set to '1'
RDY	FMCS:RDY bit	RY/BYX	P19_0	112	
FCLK		FCLK	P19_2	114	Clock input
WEX	Internal control signal + control via interface circuit	WEX	P18_0	118	
OEX		OEX	P19_6	117	
CEX		CEX	P19_5	116	
RAS		RAS	MD_3	98	
EQIN		EQIN	MONCLK	97	
LTIN		LTIN	P23_0	68	Set to '0'
—		TESTX	P19_4	115	Set to '1'
—		RDYI	P19_1	113	Set to '0'
FA0	Internal address bus	FA0	P17_5	125	
FA1 to FA8		FA1 to FA8	P06_0 to P06_7	6 to 13	
FA9 to FA16	Internal address bus	FA9 to FA16	P05_0 to P05_7	14 to 21	
—		FA17 to FA19	P18_1, P18_2, P18_4	119, 120, 121	Set to '0'
—		FA20,FA21	P18_5, P18_6	122, 123	Set to "10"
DI0 to DI7, DO0 to DO7	Internal data bus	DQ0 to DQ7	P01_0 to P01_7	24 - 31	

15.7.4 Wait time before data flash access in parallel programming mode

After power-on or the end of a Setting Initialization Request (INITX), the internal data flash security module fetches the security information. The parallel programmer cannot access the flash until the security vector fetch is finished and has to wait for the following time:

- Min waittime after VDD5/VDD5R power on : 2.9 ms
- Min waittime after INITX rising : 1.0 ms

15.8 Data Flash Security

15.8.1 Data Flash Security Operation

The data flash security protects the flash against unauthorized read and write access.

- A **read** access to protected flash will return data=0x00 without notification. There is no flag indicating that the read access was masked by data flash security module.
- A **write** access to a write-protected sector will be cancelled.
  The flash macro will be put into RESET state, and the security macro will re-fetch the security information.
  It may take up to 600µs until the data flash can be accessed again.
  In direct access mode, the toggle bits will not change and the bit DFCS:RDY will not go to low state.
  In command sequencer mode, the flag DFWS:WERINT is set, indicating that the write operation was not successful.
- The only possible write operation to a protected sector is Chip Erase.
- The data flash security can be disabled by setting the external pin FSC_DISABLE = 1.
- After INIT, please wait 3 ms before accessing the data flash. This time is needed for the security vector fetch as well as internal signal synchronization. This time is valid also if FSC_DISABLE = 1.

15.8.2 Security Vectors

Two 16-bit Data Flash Security Vectors (DFSV1, DFSV2) are located in the 256 byte security sector, controlling the protection functions of the Data Flash Security module:

DFSV1[15:0]: 0xFFFB:FF00
DFSV2[15:0]: 0xFFFB:FF02

	Vectors				
Address	**+0**	**+1**	**+2**	**+3**	**Block**
$FFFBFF00_H$	DFSV1[15:0]		DFSV2[15:0]		Data Flash Security Vectors

15.8.3 Security Vector DFSV1 (bit15 to bit0)

The setting of the Flash Security Vector DFSV1 is responsible for the read and write protection modes.

Explanation of the bits in the Flash Security Vector DFSV1 [15:0]

DFSV1[15:3]	DFSV1[2] Write Protection Level	DFSV1[1] Write Protection	DFSV1[0] Read Protection	Flash Security Mode
set all to “0”	set to “0”	set to “0”	set to “1”	Read Protection (all device modes, except INTVEC [1])
set all to “0”	set to “0”	set to “1”	set to “0”	Write Protection (all device modes, without exception)
set all to “0”	set to “0”	set to “1”	set to “1”	Read Protection (all device modes, except INTVEC) and Write Protection (all device modes, without exception)
set all to “0”	set to “1”	set to “0”	set to “1”	Read Protection (all device modes, except INTVEC)
set all to “0”	set to “1”	set to “1”	set to “0”	Write Protection (all device modes, except INTVEC)
set all to “0”	set to “1”	set to “1”	set to “1”	Read Protection (all device modes, except INTVEC) and Write Protection (all device modes, except INTVEC)

1. INTVEC mode is the Internal Vector Fetch mode (MD[2:0] = “000”)

Note : If Read Protection is set and the device is not in INTVEC mode and the data flash is written using the Command Sequencer write access, then the command sequencer will set the error flag because it cannot check that the flash programming was successful.

15.8.4 Security Vector DFSV2

The setting of the Flash Security Vector DFSV2 bits [15:0] is responsible for the individual write protection of the Data Flash sectors. It is only evaluated if write protection bit DFSV1 [1] is set.

Explanation of the bits in the Flash Security Vector DFSV2[15:0]

DFSV2 bit	Sector	Enable Write Protection	Disable Write Protection	Comment
DFSV2[0]	SA0	set to “0”	set to “1”	
DFSV2[1]	SA1	set to “0”	set to “1”	
DFSV2[2]	SA2	set to “0”	set to “1”	
DFSV2[3]	SA3	set to “0”	set to “1”	
DFSV2[7:4]	—	—	—	sectors not available
DFSV2[8]	SAS	set to “0”	—	write protection is mandatory!
DFSV2[15:9]	—	—	—	sectors not available

Note : It is mandatory to always set the sector where the Flash Security Vectors DFSV1 and DFSV2 are located to write protected (here sector SAS). Otherwise it is possible to overwrite the Security Vector to a setting where it is possible to either read out the Flash content or manipulate data by writing.
See section 15.4“Data Flash access in CPU mode” for an overview about the sector organisation of the Flash Memory.

15.8.5 Data Flash Security Registers

The Data Flash Security module can be used to calculate a CRC over the Data Flash contents. And it is possible to force a security vector re-fetch by using the following registers.

DFSCR0 : Data Flash Security Control Register 0

Address	31:24	23:16	15:8	7:0	bit
07118_H	S[7:0] CRC[31:24]	CRC[23:0]			
	1111 1111	1111 1111	1111 1111	1111 1111	Initial value
	W, R	R	R	R	Attribute

S[7:0]	Sequence Activation
0xA5 --> 0x5A	Start of a Flash Security Vector Re-Fetch Sequence (write only)
0xF0 --> 0x0F	Start of a Flash Memory CRC32 Checksum Sequence (write only)

- Continuously writing “$A5_H$”, “$5A_H$” in the DFSCR0[31:24] register will start a Flash Security Vector Re-fetch sequence immediately after writing “$5A_H$”. There is no time restrictions between “$A5_H$” and “$5A_H$”, but if “$A5_H$” is written followed by the one other than “$5A_H$”, it must be written “$A5_H$” again. If not, the Re-Fetch sequence cannot be started even if “$5A_H$” is written.
- Continuously writing “$F0_H$”, “$0F_H$” in the DFSCR0[31:24] register will start a CRC32 checksum sequence immediately after writing “$0F_H$”. There is no time restrictions between “$F0_H$” and “$0F_H$”, but if “$F0_H$” is written followed by the one other than “$0F_H$”, it must be written “$F0_H$” again. If not, the CRC checksum sequence cannot be started even if “$0F_H$” is written.
- These bits are cleared by an INIT signal from external pin (INITX) or hardware watchdog and can be written only.

Note: The Flash Security Vector Re-Fetch sequence is especially intended to be used after a chip erase command to update the security status without the need of applying an external INITX reset or after changing the status of the DFSV1 security vector.

Note: The CRC calculation runs on the internal RC clock. It is recommended to switch the RC clock frequency to 2 MHz for shortening the calculation time. However, the CPU clock (CLKB) must be faster then RC clock, otherwise the CRC calculation may not start correctly.

CRC[31:0]	CRC checksum result
	CRC checksum result (read only)

- This register contains the CRC32 checksum result after completion of the CRC32 checksum sequence (the sequence completion is indicated by DFSCR1.RDY). The CRC checksum is calculated in a standard CRC32/AAL5 algorithm with the polygon x^32+x^26+x^23+x^22+x^16+x^12+x^11+x^10+x^8+x^7+x^5+x^4+x^2+x+1.
- These bits are set to 0xFFFFFFFF by an INIT signal from external pin (INITX) or hardware watchdog and can be read only.

DFSCR1 : Data Flash Security Control Register 1

Address	31:24	23:16	15:8	7:0	bit
$0711C_H$	SVF_RDY--- --- RDY	- - - - CSZ[3:0]	CSA[15:0]		
	0xxx xxx1	0000 0000	0000 0000	0000 0000	Initial value
	R/Wx	R, R/W	R/W	R/W	Attribute

- Bit30-25: Reserved bits. The read value is always “X”.
- Bit23-20: Reserved bits. The read value is always “0”.

Bit 31:

SVF_RDY	Security Vector Fetch Ready (flag)
0	The security vector has not been fetched. The data flash is protected against read and write access. Read operations to data flash return 0x00. Write operations are ignored.
1	The security vector has been done. The data flash can be accessed according to the security settings.

Bit 24:

RDY	CRC Sequence Ready (flag)
0	CRC sequence running or not yet started
1	CRC sequence ready (data in the DFSCR0 register is valid)

Bit 19-16:

CSZ[3:0]	CRC Size Mask
0000	CRC size mask is 256 Byte
0001	CRC size mask is 512 Byte
0010	CRC size mask is 1 KByte
0011	CRC size mask is 2 KByte
0100	CRC size mask is 4 KByte
0101	CRC size mask is 8 KByte
0110	CRC size mask is 16 KByte
0111	CRC size mask is 32 KByte
1000	CRC size mask is 64 KByte
1001 - 1111	Not supported

- CSZ3-0 is used as an OR-mask for the address given by CSA15-0. See address calculation below.
- These bits are cleared by an INIT signal from external pin (INITX) or hardware watchdog.

Bit 15-0

CSA[15:0]	CRC Calculation Start Address
0x00FF	CRC start address is 0x0FF00 (sector SAS start)
0x0100	CRC start address is 0x10000 (sector SA0 start)
0x0140	CRC start address is 0x14000 (sector SA1 start)

Notes: The values given above are just examples. The addresses to be written in this register are flash memory addresses like used in the flash parallel programming mode and not the mapped addresses which are used in CPU mode. See 15.7.2“Address mapping from CPU to parallel programming mode”.

- The CSA register contains the CRC start address which is aligned to 256 Byte addresses. It is only possible to calculate the CRC checksum over addresses located in the Data Flash Memory address space. Other addresses are invalid and might lead to wrong checksums.

Calculation of the CRC Start- and End-addresses

The CSZ3-0 setting is first translated into a mask value:

CSZ3-0	MASK
0000	0000_0000_0000_0000
0001	0000_0000_0000_0001
0010	0000_0000_0000_0011
0011	0000_0000_0000_0111
0100	0000_0000_0000_1111
0101	0000_0000_0001_1111
0110	0000_0000_0011_1111
0111	0000_0000_0111_1111
1000	0000_0000_1111_1111
1001-1111	and so on...

- CRC Start address = CSA[15:0] << 8 + 0x00
- CRC End address = (CSA[15:0] or MASK) << 8 + 0xFF

16. Memory Space

The FR family has 4 Gbytes of logical address space (2^{32} addresses) available to the CPU by linear access.

Direct addressing area

The following address space area is used for I/O.

This area is called direct addressing area, and the address of an operand can be specified directly in an instruction.

The size of directly addressable area depends on the length of the data being accessed as shown below.

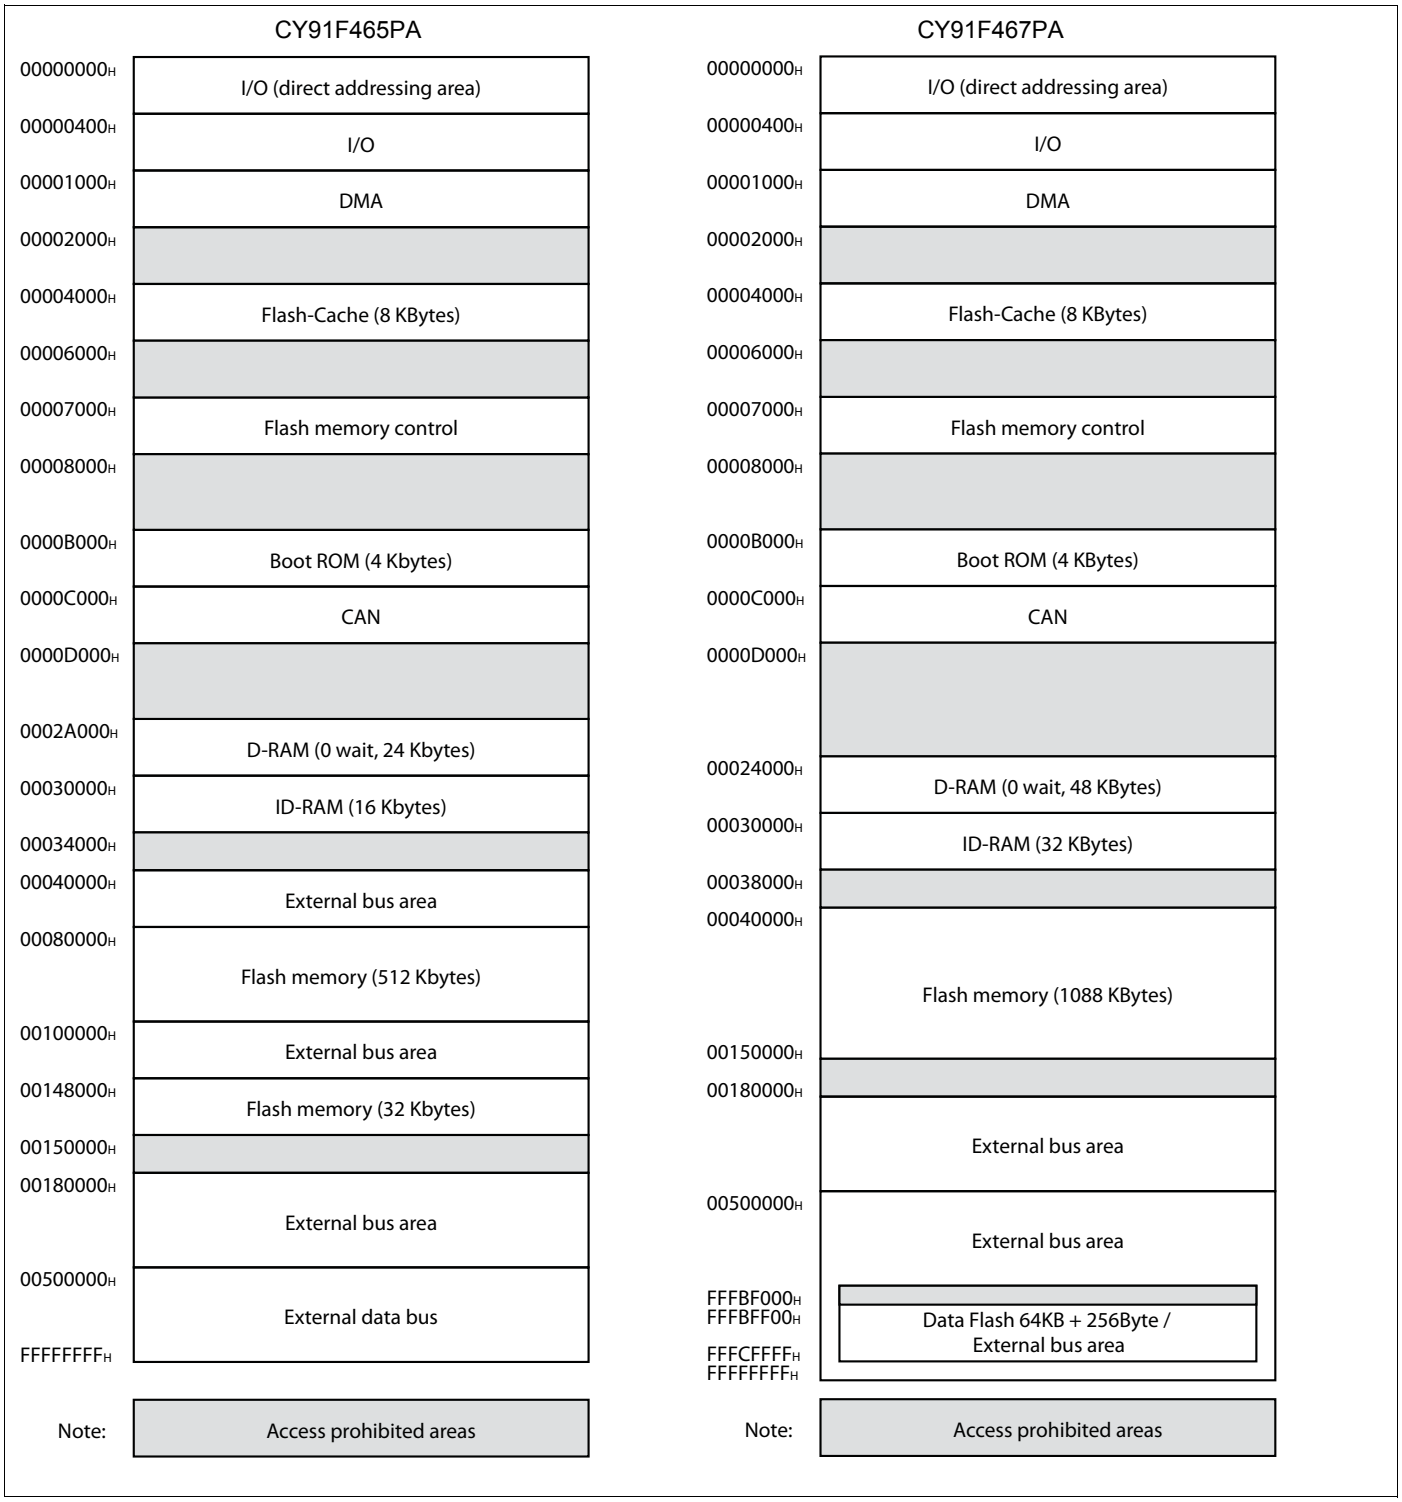
Byte data access : 000_H to $0FF_H$

Half word access : 000_H to $1FF_H$

Word data access : 000_H to $3FF_H$

17. Memory Maps

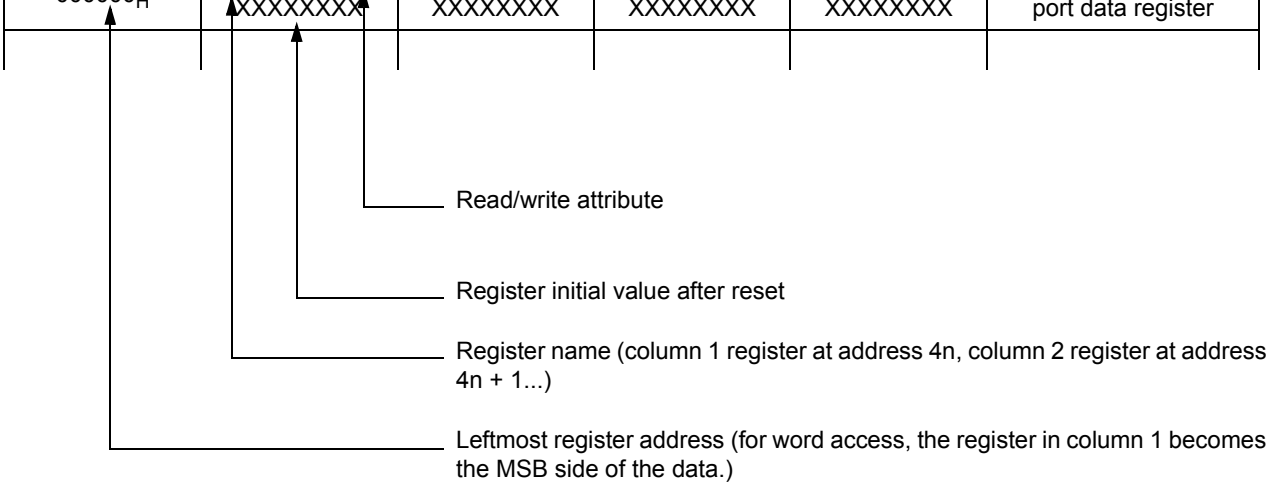
17.1 CY91F465PA, CY91F467PA



18. I/O Map

18.1 CY91F465PA, CY91F467PA

Address	Register				Block
	+ 0	+ 1	+ 2	+ 3	
000000_H	PDR0 [R/W] XXXXXXXX	PDR1 [R/W] XXXXXXXX	PDR2 [R/W] XXXXXXXX	PDR3 [R/W] XXXXXXXX	T-unit port data register



Note : Initial values of register bits are represented as follows:
" 1 " : Initial value " 1 "
" 0 " : Initial value " 0 "
" X " : Initial value " undefined "
" - " : No physical register at this location
Access is barred with an undefined data access attribute.

Address	Register				Block
	+0	+1	+2	+3

1. Writable only once and only as half-word. PPMUX is reset by INIT and RST.
2. PPMUX2 is available on CY91F467PA only. Writable only once and only as half-word, reset by INIT and RST.
3. Depends on the number of available CAN channels:
   CY91F465PA has 3 CAN channels - bits[2:0] exist
   CY91F467PA has 4 CAN channels - bits[3:0] exist

4. ADC1 is only available on CY91F467PA.
5. ACRO[11:10] depends on Modevector fetch information on buswidth.
6. TCR [3:0] INIT value = 0000, keeps value after RST.
7. Range Comparator for ADC0, ADC1 are only available on CY91F467PA.
8. ADC0, ADC1 channel data registers are only available on CY91F467PA.
9. On CY91F467PA, always write 1 to bit IOS[1].
10. PFR initial values for ports 00--10 depend on the selected mode at the modepins MD_0--MD_2:
    internal vector fetch mode (MD=000): PFR00--PFR10 initialized to all '0'
    external vector fetch mode (MD=001): PFR00--PFR10 initialized to all '1'

1. 32-bit write to flash memory only available on CY91F467PA.
2. Write operations to address 0FFFF8H and 0FFFFCH are not possible.
   When reading these addresses, the values shown above will be read.
3. Data Flash is only available on CY91F467PA.

18.3 Data Flash memory sector organisation

The Data Flash sectors can be accessed only after the data flash has been enabled by setting DFCS:FLASHEN. If the data flash is enabled, the user must ensure that no chip select area overlaps the data flash address space.

Notes:

*1 The Interrupt Control Registers (ICRs) are located in the interrupt controller and set the interrupt level for each interrupt request. An ICR is provided for each interrupt request.

*2 The vector address for each EIT (exception, interrupt or trap) is calculated by adding the listed offset to the table base register value (TBR). The TBR specifies the top of the EIT vector table. The addresses listed in the table are for the default TBR value ($000FFC00_H$). The TBR is initialized to this value by a reset. The TBR is set to $000FFC00_H$ after the internal boot ROM is executed.

*3 ICR23 and ICR47 can be exchanged by setting the REALOS compatibility bit (addr $0C03_H$: IOS[0])

*4 Used by REALOS

*5 Memory Protection Unit (MPU) support

*6 CAN 3, Data Flash, ADC1 and ADC0 (End of Scan) interrupts are available on CY91F467PA only.

20. Recommended Settings

20.1 PLL and Clockgear settings

Please note that for CY91F465PA the core base clock frequencies are valid in the 1.8V operation mode of the Main regulator and Flash.

Recommended PLL divider and clockgear settings

PLL Input (CLK) [MHz]	Frequency Parameter		Clockgear Parameter		PLL Output (X) [MHz]	Core Base Clock [MHz]	Remarks
	DIVM	DIVN	DIVG	MULG	MULG

4	12	3	16	32	144	12	

20.2 Clock Modulator settings

The following table shows all possible settings for the Clock Modulator in a base clock frequency range from 32MHz up to 88MHz.

The Flash access time settings need to be adjusted according to Fmax while the PLL and clockgear settings should be set according to base clock frequency.

Clock Modulator settings, frequency range and supported supply voltage

21. Electrical Characteristics

21.1 Absolute maximum ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply slew rate	—	—	50	V/ms	
Power supply voltage 1*1	$V_{DD}5R$	− 0.3	+ 6.0	V	
Power supply voltage 2*1	$V_{DD}5$	− 0.3	+ 6.0	V	
Power supply voltage 3*1	$V_{DD}35$	− 0.3	+ 6.0	V	
Relationship of the supply voltages	$AV_{CC}5$	$V_{DD}5$-0.3	$V_{DD}5$+0.3	V	At least one of the pins P07, P16, P20, P24, or P29 (ANn) is used as digital input or output.
		$V_{SS}5$-0.3	$V_{DD}5$+0.3	V	All pins of the ports P07, P16, P20, P24, or P29 (ANn) follow the condition of V_{IA}
Analog power supply voltage*1	$AV_{CC}5$	− 0.3	+ 6.0	V	*2
Analog reference power supply voltage*1	AVRH	− 0.3	+ 6.0	V	*2
Input voltage 1*1	V_{I1}	Vss5 − 0.3	$V_{DD}5$ + 0.3	V	
Input voltage 2*1	V_{I2}	Vss5 − 0.3	$V_{DD}35$ + 0.3	V	External bus
Analog pin input voltage*1	V_{IA}	AVss5 − 0.3	AVcc5 + 0.3	V	
Output voltage 1*1	V_{O1}	Vss5 − 0.3	$V_{DD}5$ + 0.3	V	
Output voltage 2*1	V_{O2}	Vss5 − 0.3	$V_{DD}35$ + 0.3	V	External bus
Maximum clamp current	I_{CLAMP}	− 4.0	+ 4.0	mA	*3
Total maximum clamp current	$\Sigma \lvert I_{CLAMP} \rvert$	—	20	mA	*3
"L" level maximum output current*4	I_{OL}	—	10	mA	
"L" level average output current*5	I_{OLAV}	—	8	mA	
"L" level total maximum output current	ΣI_{OL}	—	100	mA	
"L" level total average output current*6	ΣI_{OLAV}	—	50	mA	
"H" level maximum output current*4	I_{OH}	—	− 10	mA	
"H" level average output current*5	I_{OHAV}	—	− 4	mA	
"H" level total maximum output current	ΣI_{OH}	—	− 100	mA	
"H" level total average output current*6	ΣI_{OHAV}	—	− 25	mA	
Permitted operating frequency	$f_{max, CLKB}$	—	100	MHz	$T_A \leq 105$ °C
	$f_{max, CLKP}$	—	50		
	$f_{max, CLKT}$	—	50		
	$f_{max, CLKCAN}$	—	50		

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Permitted operating frequency	$f_{max, CLKB}$	—	96	MHz	$T_A \leq 125$ °C
	$f_{max, CLKP}$	—	48		
	$f_{max, CLKT}$	—	48		
	$f_{max, CLKCAN}$	—	48		
Permitted power dissipation *7	P_D	—	1250 *8	mW	$T_A \leq 85$ °C
		—	630 *8	mW	$T_A \leq 105$ °C
		—	1400 *8	mW	$T_A \leq 105$ °C, no Flash program/erase *9
		—	1100 *8	mW	$T_A \leq 115$ °C, no Flash program/erase *9
		—	780 *8	mW	$T_A \leq 125$ °C, no Flash program/erase *9
Operating temperature	T_A	− 40	+ 125	°C	
Storage temperature	Tstg	− 55	+ 150	°C	

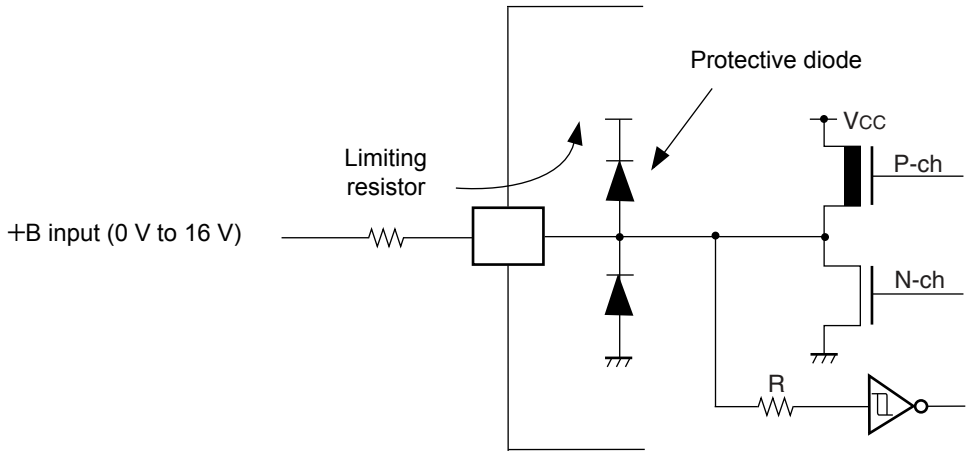
*1 : The parameter is based on $V_{SS}5 = AV_{SS}5 = 0.0$ V.

*2 : $AV_{CC}5$ and AVRH5 must not exceed $V_{DD}5$ + 0.3 V.

*3 :
- Use within recommended operating conditions.
- Use with DC voltage (current).
- +B signals are input signals that exceed the $V_{DD}5$ voltage. +B signals should always be applied by connecting a limiting resistor between the +B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed the rated value at any time, either instantaneously or for an extended period, when the +B signal is input.
- Note that when the microcontroller drive current is low, such as in the low power consumption modes, the +B input potential can increase the potential at the power supply pin via a protective diode, possibly affecting other devices.
- Note that if the +B signal is input when the microcontroller is off (not fixed at 0 V), power is supplied through the +B input pin; therefore, the microcontroller may partially operate.
- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.

- Do not leave +B input pins open.
- Example of recommended circuit :

Input/output equivalent circuit



*4 : Maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

*5 : Average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 100 ms period.

*6 : Total average output current is defined as the value of the average current flowing through all of the corresponding pins for a 100 ms period.

*7 : The maximum permitted power dissipation depends on the ambient temperature, the air flow velocity and the thermal conductance of the package on the PCB.

The actual power dissipation depends on the customer application and can be calculated as follows:

$P_D = P_{IO} + P_{INT}$

$P_{IO} = \Sigma (V_{OL} * I_{OL} + V_{OH} + I_{OH})$ (IO load power dissipation, sum is performed on all IO ports)

$P_{INT} = V_{DD}5R * I_{CC} + AV_{CC}5 * I_A + AVRH5 * I_R$ (internal power dissipation)

*8 : Worst case value for the QFP package mounted on a 4-layer PCB at specified T_A without air flow.

*9 : Please contact Cypress for reliability limitations when using under these conditions.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

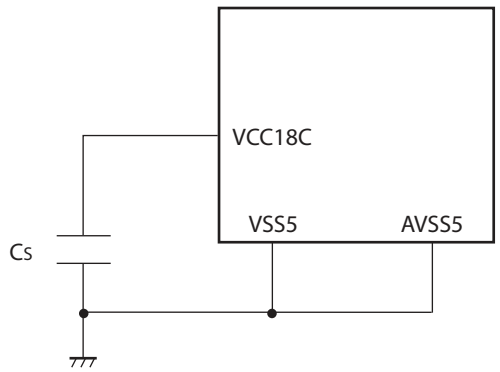
21.2 Recommended operating conditions

($V_{SS}5 = AV_{SS}5 = 0.0$ V)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power supply voltage	$V_{DD}5$	3.0	—	5.5	V	
	$V_{DD}5R$	3.0	—	5.5	V	Internal regulator
	$V_{DD}35$	3.0	—	5.5	V	External bus
	$AV_{CC}5$	3.0	—	5.5	V	A/D converter
Smoothing capacitor at VCC18C pin	C_S	—	4.7	—	µF	Use a X7R ceramic capacitor or a capacitor that has similar frequency characteristics.
Power supply slew rate		—	—	50	V/ms	
Main Oscillation stabilisation time		10			ms	
Lock-up time PLL (4 MHz ->16 ...100MHz)				0.6	ms	
ESD Protection (Human body model)	V_{surge}	2			kV	$R_{discharge}$ = 1.5kΩ $C_{discharge}$ = 100pF
RC Oscillator	$f_{RC100kHz}$ f_{RC2MHz}	50 1	100 2	200 4	kHz MHz	$VDD_{CORE} \geq 1.65V$

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges.
Operation outside these ranges may adversely affect reliability and could result in device failure.
No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet.
Users considering application outside the listed conditions are advised to contact their representatives beforehand.



21.3 DC characteristics

Note: In the following tables, "V_{DD}" means $V_{DD}35$ for pins of ext. bus or $V_{DD}5$ for other pins.
In the following tables, "V_{SS}" means ground Pins $V_{SS}5$ for the other pins.
($V_{DD}5 = AV_{CC}5 = 3.0$ V to 5.5 V, $V_{SS}5 = AV_{SS}5 = 0$ V, $T_A = -40$ °C to + 125 °C)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ	Max		
Input "H" voltage	V_{IH}	—	Port inputs if CMOS Hysteresis 0.8/0.2 input is selected	$0.8 \times V_{DD}$	—	V_{DD} + 0.3	V	CMOS hysteresis input
		—	Port inputs if CMOS Hysteresis 0.7/0.3 input is selected	$0.7 \times V_{DD}$	—	V_{DD} + 0.3	V	4.5 V ≤ V_{DD} ≤ 5.5 V
				$0.74 \times V_{DD}$	—	V_{DD} + 0.3	V	3 V ≤ V_{DD} < 4.5 V
		—	AUTOMOTIVE Hysteresis input is selected	$0.8 \times V_{DD}$	—	V_{DD} + 0.3	V	
		—	Port inputs if TTL input is selected	2.0	—	V_{DD} + 0.3	V	
	V_{IHR}	INITX	—	$0.8 \times V_{DD}$	—	V_{DD} + 0.3	V	INITX input pin (CMOS Hysteresis)
	V_{IHM}	MD_2 to MD_0	—	V_{DD} − 0.3	—	V_{DD} + 0.3	V	Mode input pins
	V_{IHX0S}	X0, X0A	—	2.5	—	V_{DD} + 0.3	V	External clock in "Oscillation mode"
	V_{IHX0F}	X0	—	$0.8 \times V_{DD}$	—	V_{DD} + 0.3	V	External clock in "Fast Clock Input mode"

1. Pnn_m includes all GPIO pins. Analog (AN) channels and PullUp/PullDown are disabled.
2. ANn includes all pins where AN channels are enabled.
3. Pnn_m includes all GPIO pins. The pull up resistors must be enabled by PPER/PPCR setting and the pins must be in input direction.

4. Pnn_m includes all GPIO pins. The pull down resistors must be enabled by PPER/PPCR setting and the pins must be in input direction.
5. Main regulator OFF, sub regulator set to 1.2V, Low voltage detection disabled.
6. CY91F467PA target data
7. Main regulator OFF, sub regulator set to 1.2V, Low voltage detection disabled.

21.4 A/D converter characteristics

($V_{DD}5 = AV_{CC}5 = 3.0$ V to 5.5 V, $V_{SS}5 = AV_{SS}5 = 0$ V, $T_A = -40$ °C to + 125 °C)

Parameter	Symbol	Pin name	Value			Unit	Remarks
			Min	Typ	Max		
Resolution	—	—	—	—	10	bit	
Total error	—	—	− 3	—	+ 3	LSB	
Nonlinearity error	—	—	− 2.5	—	+ 2.5	LSB	
Differential nonlinearity error	—	—	− 1.9	—	+ 1.9	LSB	
Zero reading voltage	V_{OT}	ANn	AVRL−1.5 LSB	AVRL + 0.5 LSB	AVRL + 2.5 LSB	V	
Full scale reading voltage	V_{FST}	ANn	AVRH−3.5 LSB	AVRH−1.5 LSB	AVRH + 0.5 LSB	V	
Compare time	T_{comp}	—	0.6	—	16,500	µs	4.5 V ≤ $AV_{CC}5$ ≤5.5
			2.0	—	—	µs	3.0 V ≤ $AV_{CC}5$ ≤ 4.5 V
Sampling time	T_{samp}	—	0.4	—	—	µs	4.5 V ≤ $AV_{CC}5$ ≤ 5.5 V, R_{EXT} < 2 kΩ
			1.0	—	—	µs	3.0 V ≤ $AV_{CC}5$ ≤ 4.5 V, R_{EXT} < 1 kΩ
Conversion time	T_{conv}	—	1.0	—	—	µs	4.5 V ≤ $AV_{CC}5$ ≤ 5.5 V

Analog input leakage current	I_{AIN}	ANn	− 1	—	+ 1	µA	T_A = + 25 °C
			− 3	—	+ 3	µA	T_A = + 125 °C
Analog input voltage range	V_{AIN}	ANn	AVRL	—	AVRH	V	
Offset between input channels	—	ANn	—	—	4	LSB	

(Continued)

Note : The accuracy gets worse as AVRH - AVRL becomes smaller

(Continued)

Parameter	Symbol	Pin name	Value			Unit	Remarks
			Min	Typ	Max		
Reference voltage range	AVRH	AVRH5	$0.75 \times AV_{CC}5$	—	$AV_{CC}5$	V	
	AVRL	$AV_{SS}5$	$AV_{SS}5$	—	$AV_{CC}5 \times 0.25$	V	
Power supply current per ADC macro *3	I_A	$AV_{CC}5$	—	2.5	5	mA	A/D Converter active
	I_{AH}	$AV_{CC}5$	—	—	5	µA	A/D Converter not operated *1
Reference voltage current per ADC macro *3	I_R	AVRH5	—	0.7	1	mA	A/D Converter active
	I_{RH}	AVRH5	—	—	5	µA	A/D Converter not operated *2

*1 : Supply current at $AV_{CC}5$, if A/D converter and ALARM comparator are not operating, ($V_{DD}5 = AV_{CC}5 = AVRH = 5.0$ V)

*2 : Input current at AVRH5, if A/D converter is not operating, ($V_{DD}5 = AV_{CC}5 = AVRH = 5.0$ V)

*3 : The current consumption per ADC macro is given here. On devices having more then one A/D converter, the current values have to be multiplied by the number of macros.

Sampling Time Calculation

$T_{samp} = (2.6\ kOhm + R_{EXT}) \times 11pF \times 7$; for $4.5V \leq AV_{CC}5 \leq 5.5V$

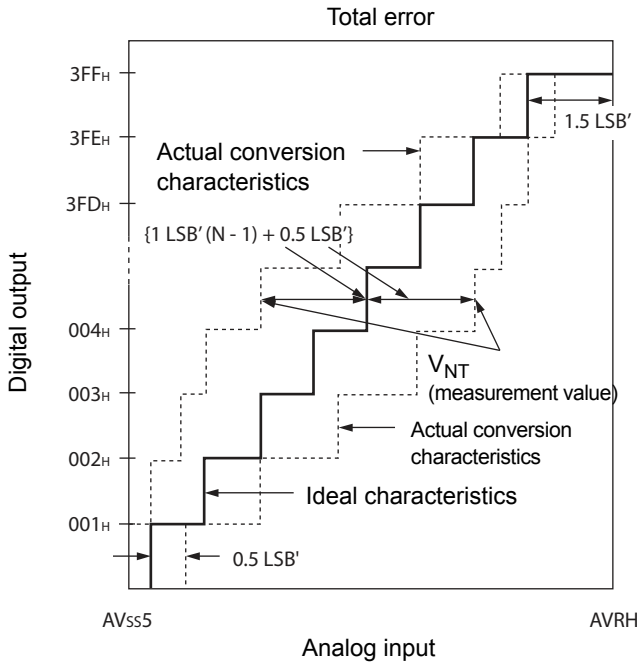
$T_{samp} = (12.1\ kOhm + R_{EXT}) \times 11pF \times 7$; for $3.0V \leq AV_{CC}5 \leq 4.5V$

Conversion Time Calculation

$T_{conv} = T_{samp} + T_{comp}$

Definition of A/D converter terms

- Resolution
  Analog variation that is recognizable by the A/D converter.
- Nonlinearity error
  Deviation between actual conversion characteristics and a straight line connecting the zero transition point ($00\ 0000\ 0000_B \leftrightarrow 00\ 0000\ 0001_B$) and the full scale transition point ($11\ 1111\ 1110_B \leftrightarrow 11\ 1111\ 1111_B$).
- Differential nonlinearity error
  Deviation of the input voltage from the ideal value that is required to change the output code by 1 LSB.
- Total error
  This error indicates the difference between actual and theoretical values, including the zero transition error, full scale transition error, and nonlinearity error.



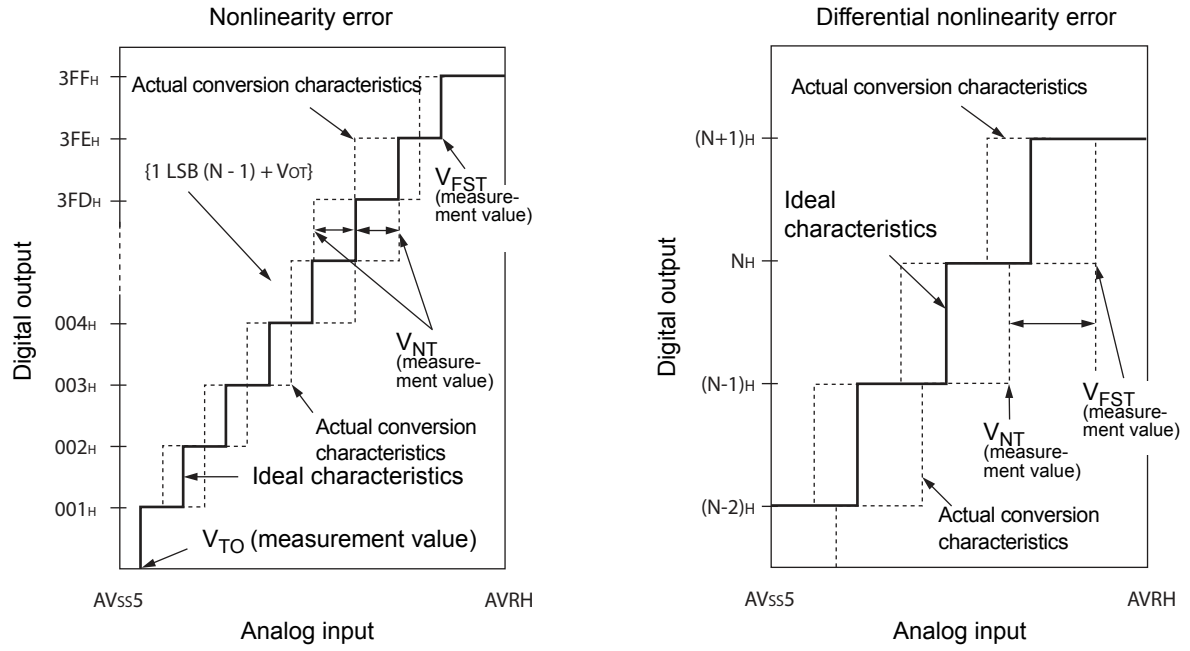
$$1LSB' \text{ (ideal value)} = \frac{AVRH - AV_{SS}5}{1024} \text{ [V]}$$

$$\text{Total error of digital output N} = \frac{V_{NT} - \{1\ LSB' \times (N - 1) + 0.5\ LSB'\}}{1\ LSB'}$$

N : A/D converter digital output value
V_{OT}' (ideal value) = $AV_{SS}5 + 0.5$ LSB' [V]
V_{FST}' (ideal value) = AVRH − 1.5 LSB' [V]
V_{NT} : Voltage at which the digital output changes from $(N + 1)_H$ to N_H

(Continued)

(Continued)



$$\text{Nonlinearity error of digital output N} = \frac{V_{NT} - \{1LSB \times (N - 1) + V_{OT}\}}{1LSB} \text{ [LSB]}$$

$$\text{Differential nonlinearity error of digital output N} = \frac{V_{(N+1)T} - V_{NT}}{1LSB} - 1 \text{ [LSB]}$$

$$1LSB = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

N : A/D converter digital output value
V_{OT} : Voltage at which the digital output changes from 000_H to 001_H.
V_{FST} : Voltage at which the digital output changes from $3FE_H$ to $3FF_H$.

21.5 FLASH memory program/erase characteristics

21.5.1 CY91F465PA

($V_{DD}5$ = 3.0 V to 5.5 V, $V_{DD}5R$ = 3.0 V to 5.5 V, $V_{SS}5$ = 0 V, T_A = -40 °C to + 105 °C)

Parameter	Value			Unit	Remarks
	Min	Typ	Max		
Sector erase time	-	0.9	3.6	s	Erasure programming time not included
Chip erase time	-	n*0.9	n*3.6	s	n is the number of Flash sector of the device
Word (16-bit width) programming time	-	23	370	µs	System overhead time not included
Programme/Erase cycle	10 000			cycle	
Flash data retention time	20			year	*1

*1: This value was converted from the results of evaluating the reliability of the technology (using Arrhenius equation to convert high temperature measurements into normalized value at 85°C)

21.5.2 CY91F467PA

($V_{DD}5$ = 3.0 V to 5.5 V, $V_{DD}5R$ = 3.0 V to 5.5 V, $V_{SS}5$ = 0 V, T_A = -40 °C to + 105 °C)

Parameter	Value			Unit	Remarks
	Min	Typ	Max		
Sector erase time	-	0.5	2.0	s	Erasure programming time not included
Chip erase time	-	n*0.5	n*2.0	s	n is the number of Flash sector of the device
Word (16 or 32-bit width) programming time	-	6	100	µs	System overhead time not included
Program/Erase cycle	10 000			cycle	
Flash data retention time	20			year	*1

*1: This value was converted from the results of evaluating the reliability of the technology (using Arrhenius equation to convert high temperature measurements into normalized value at 85°C)

21.5.3 CY91F467PA DATA FLASH

($V_{DD}5$ = 3.0 V to 5.5 V, $V_{DD}5R$ = 3.0 V to 5.5 V, $V_{SS}5$ = 0 V, T_A = -40 °C to + 105 °C)

Parameter	Value			Unit	Remarks
	Min	Typ	Max		
Sector erase time	-	0.5	2.0	s	Erasure programming time not included
	-	0.8	3.6	s	Erasure programming time is included
Bye programming time	-	15	100	µs	System overhead time not included
Word programming time (32bit width command sequencer write *1)	-	63	403	µs	System overhead time is included CLKB = 64 MHz
Program/Erase cycle	100 000			cycle	at Tj=<105 °C / 10,000 cycle at Tj>105 °C

1. The time from CPU write access until the interrupt flag DFWS:FININT is set.
   It includes 4 byte programming times + 180 CLKB cycles for write sequence, RDY polling and result verification done by the command sequencer. Does not include the interrupt latency time of the CPU.

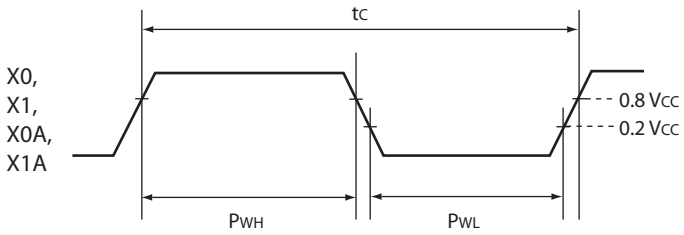
21.6 AC characteristics

21.6.1 Clock timing

($V_{DD}5$ = 3.0 V to 5.5 V, Vss5 = AVss5 = 0 V, T_A = –40 °C to + 125 °C)

Parameter	Symbol	Pin name	Value			Unit	Condition
			Min	Typ	Max		
Clock frequency	f_C	X0 X1	3.5	4	16	MHz	Opposite phase external supply or crystal
		X0A X1A	32	32.768	100	kHz	

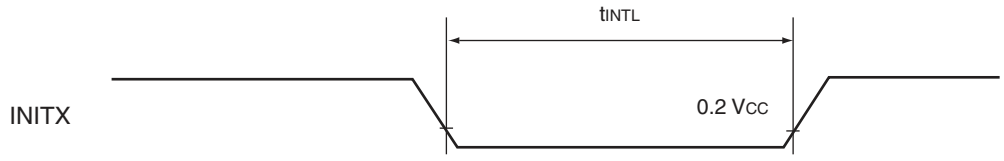
Clock timing condition



21.6.2 Reset input ratings

($V_{DD}5$ = 3.0 V to 5.5 V, $V_{SS}5$ = $AV_{SS}5$ = 0 V, T_A = –40 °C to + 125 °C)

Parameter	Symbol	Pin name	Condition	Value		Unit
				Min	Max	
INITX input time (at power-on)	t_{INTL}	INITX	—	8	—	ms
INITX input time (other than the above)				20	—	µs



21.6.3 LIN-USART Timings at $V_{DD}5$ = 3.0 to 5.5 V

- Conditions during AC measurements

  All AC tests were measured under the following conditions:

  - IO_{drive} = 5 mA
  - $V_{DD}5$ = 3.0 V to 5.5 V, I_{load} = 3 mA
  - $V_{SS}5$ = 0 V
  - T_a = -40 ·C to +125 ·C
  - C_l = 50 pF (load capacity value of pins when testing)
  - VOL = 0.2 x $V_{DD}5$
  - VOH = 0.8 x $V_{DD}5$
  - EPILR = 0, PILR = 1 (Automotive Level = worst case)

($V_{DD}5 = 3.0$ V to 5.5 V, $V_{SS}5 = AV_{SS}5 = 0$ V, $T_A = -40$ °C to + 125 °C)

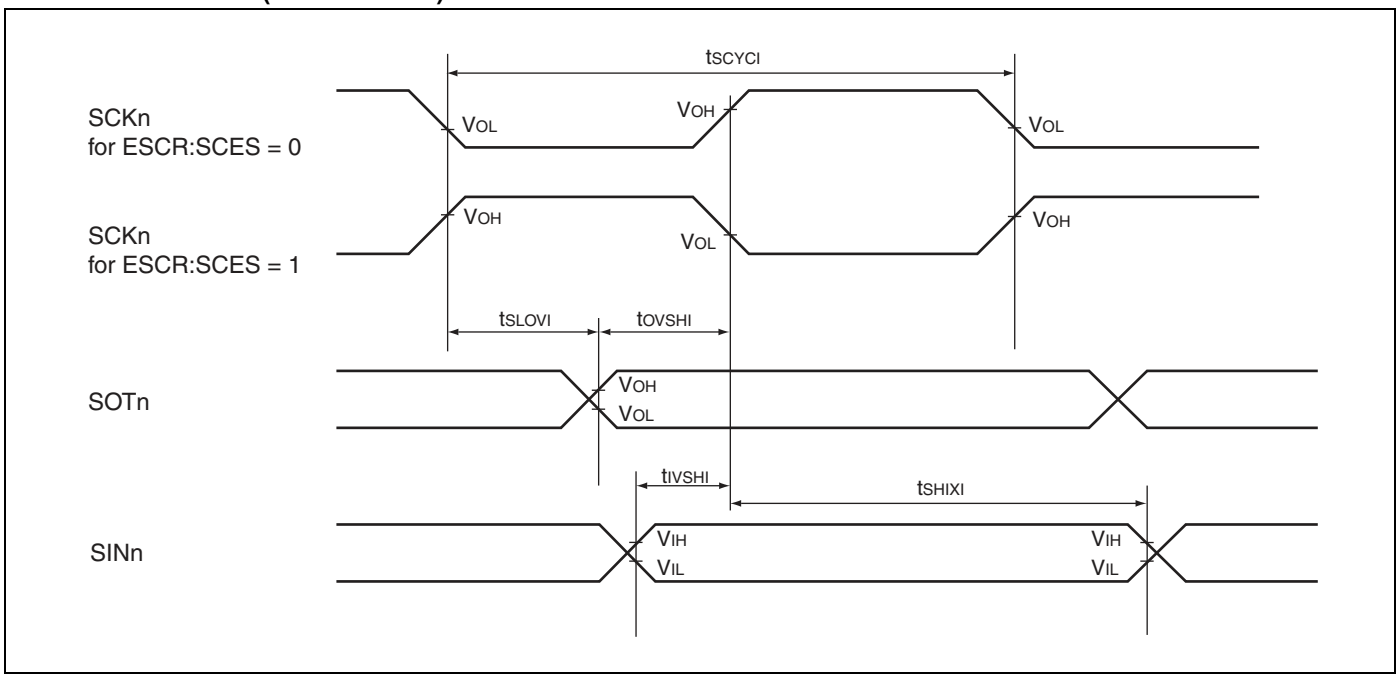
Parameter	Symbol	Pin name	Condition	$V_{DD}5 = 3.0$ V to 4.5 V		$V_{DD}5 = 4.5$ V to 5.5 V		Unit
				Min	Max	Min	Max	
Serial clock cycle time	t_{SCYCI}	SCKn	Internal clock operation (master mode)	4 t_{CLKP}	—	4 t_{CLKP}	—	ns
SCK ↓ → SOT delay time	t_{SLOVI}	SCKn SOTn		− 30	30	− 20	20	ns
SOT → SCK ↓ delay time	t_{OVSHI}	SCKn SOTn		m × t_{CLKP} − 30*	—	m × t_{CLKP} − 20*	—	ns
Valid SIN → SCK ↑ setup time	t_{IVSHI}	SCKn SINn		t_{CLKP} + 55	—	t_{CLKP} + 45	—	ns
SCK ↑ → valid SIN hold time	t_{SHIXI}	SCKn SINn		0	—	0	—	ns
Serial clock “H” pulse width	t_{SHSLE}	SCKn	External clock operation (slave mode)	t_{CLKP} + 10	—	t_{CLKP} + 10	—	ns
Serial clock “L” pulse width	t_{SLSHE}	SCKn		t_{CLKP} + 10	—	t_{CLKP} + 10	—	ns
SCK ↓ → SOT delay time	t_{SLOVE}	SCKn SOTn		—	2 t_{CLKP} + 55	—	2 t_{CLKP} + 45	ns
Valid SIN → SCK ↑ setup time	t_{IVSHE}	SCKn SINn		10	—	10	—	ns
SCK ↑ → valid SIN hold time	t_{SHIXE}	SCKn SINn		t_{CLKP} + 10	—	t_{CLKP} + 10	—	ns
SCK rising time	t_{FE}	SCKn		—	20	—	20	ns
SCK falling time	t_{RE}	SCKn		—	20	—	20	ns

* : Parameter m depends on t_{SCYCI} and can be calculated as :

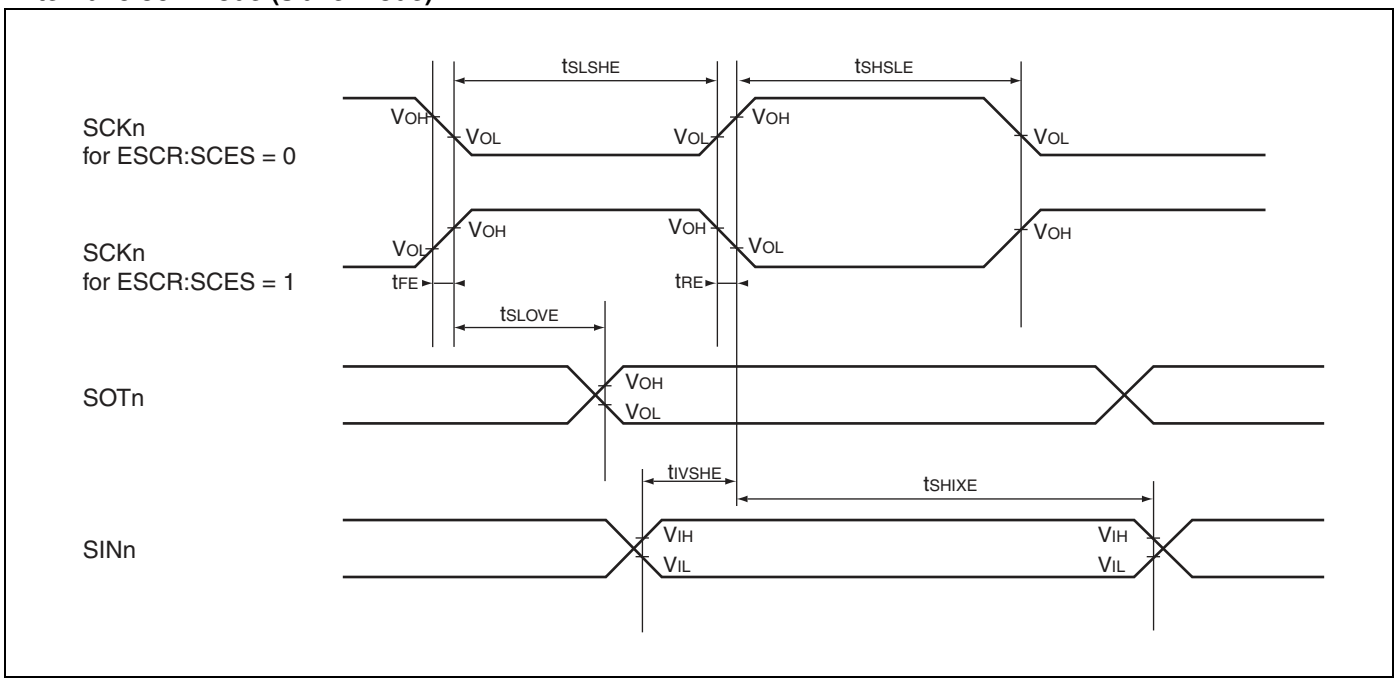
- if $t_{SCYCI} = 2*k*t_{CLKP}$, then m = k, where k is an integer > 2
- if $t_{SCYCI} = (2*k + 1)*t_{CLKP}$, then m = k + 1, where k is an integer > 1

Notes :
- The above values are AC characteristics for CLK synchronous mode.
- t_{CLKP} is the cycle time of the peripheral clock.

Internal clock mode (master mode)



External clock mode (slave mode)



21.6.4 I^2C AC Timings at $V_{DD}5$ = 3.0 to 5.5 V

- Conditions during AC measurements

  All AC tests were measured under the following conditions:

  - IO_{drive} = 3 mA
  - $V_{DD}5$ = 3.0 V to 5.5 V, I_{load} = 3 mA
  - $V_{SS}5$ = 0 V
  - Ta = − 40 °C to + 125 °C
  - C_l = 50 pF
  - VOL = 0.3 × $V_{DD}5$
  - VOH = 0.7 × $V_{DD}5$
  - EPILR = 0, PILR = 0 (CMOS Hysteresis 0.3 × $V_{DD}5$/0.7 × $V_{DD}5$)

Fast mode:

($V_{DD}5$ = 3.5 V to 5.5 V, $V_{SS}5$ = $AV_{SS}5$ = 0 V, T_A = −40 °C to + 125 °C)

Parameter	Symbol	Pin name	Value		Unit	Remark
			Min	Max		
SCL clock frequency	f_{SCL}	SCLn	0	400	kHz	
Hold time (repeated) START condition. After this period, the first clock pulse is generated	$t_{HD;STA}$	SCLn, SDAn	0.6	—	µs	
LOW period of the SCL clock	t_{LOW}	SCLn	1.3	—	µs	
HIGH period of the SCL clock	t_{HIGH}	SCLn	0.6	—	µs	
Setup time for a repeated START condition	$t_{SU;STA}$	SCLn, SDAn	0.6	—	µs	
Data hold time for I^2C-bus devices	$t_{HD;DAT}$	SCLn, SDAn	0	0.9	µs	
Data setup time	$t_{SU;DAT}$	SCLn SDAn	100	—	ns	
Rise time of both SDA and SCL signals	t_r	SCLn, SDAn	20 + 0.1C_b	300	ns	
Fall time of both SDA and SCL signals	t_f	SCLn, SDAn	20 + 0.1C_b	300	ns	
Setup time for STOP condition	$t_{SU;STO}$	SCLn, SDAn	0.6	—	µs	
Bus free time between a STOP and START condition	t_{BUF}	SCLn, SDAn	1.3	—	µs	
Capacitive load for each bus line	C_b	SCLn, SDAn	—	400	pF	
Pulse width of spike suppressed by input filter	t_{SP}	SCLn, SDAn	0	(1..1.5) × t_{CLKP}	ns	*1

*1: The noise filter will suppress single spikes with a pulse width of 0ns and between (1 to 1.5) cycles of peripheral clock, depending on the phase relationship between I2C signals (SDA, SCL) and peripheral clock.

Note: t_{CLKP} is the cycle time of the peripheral clock.

NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS.

2. DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.

3. DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.

4. TO BE DETERMINED AT SEATING PLANE C.

5. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PER SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.

6. DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.

7. REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS, DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS, BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDED BODY.

8. DIMENSION b DOES NOT INCLUDE DAMBER PROTRUSION. THE DAMBAR PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.

9. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.

10. A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

002-15150 **

PACKAGE OUTLINE, 176 LEAD LQFP
26.00x26.00x1.7 MM LQFP176 REV**

24. Revision History

Version	Date	Remark
2.0	2008-06-10	Initial version
2.1	2008-08-15	Handling devices: Section Notes on PS Register changed for better understanding Interrupt Vector Table: corrected the footnotes FLASH: Added note about the flash operation mode switching, added section "Poweron Sequence in parallel programming mode" Absolute maximum ratings: Removed the note that analog input/output pins cannot accept +B signal input. DC Characteristics: Updated PullUp/Down resistors, updated the footnotes splitted ILV into external and internal LV detection AD Converter characteristics updated (complete section)
2.2	2008-09-04	Added MB91F467PA with Data Flash and 2 ADC macros: - added chapter A/D Converter / New Features - added chapter A/D Converter / Range Comparator - added chapter Embedded Data Flash
2.3	2008-09-23	A/D CONVERTER / NEW FEATURES (MB91F467PA): The ADC Channel Enable feature is only available on the non-relocated ADC channels 6-7. IO MAP: Added IOS register (addr. 0xC03) with note “always write 1 to IOS[1]”; Added bookmarks inside IO MAP; the IO MAP is common for MB91F465PA and MB91F467PA. EMBEDDED DATA FLASH (MB91F467PA): Added info about read operation during Command Sequencer write is active.
3.0	2008-09-23	Data Flash: Corrected text about Command Sequencer Mode (DFWC:WE bit); corrected TMG2,TMG1,TMG0=000 to max. 6.2MHz Corrected notes about CRC calculation (CLKB faster then RC clock) Embedded Program/Data Memory (Flash): Added section 7 "Notes About Flash Memory CRC Calculation" (CLKB must be faster then the RC clock) Pin Assignment: Corrected “SYSCLK7” Pin Description: Added X0/X1 pinning spec of F467PA Added Ta=125C characteristics
3.1	not released yet	Embedded Data Flash: Added 3 notes that “Dummy addresses for auto algorithm” cannot be used for toggle bit polling. DFCS register bit description: corrected INTEN into INTE, Data flash security: Added information about FSC_DISABLE. FLASH memory program/erase characteristics: Added 5.3 MB91F467PA DATA FLASH (erase / programming times)

25. Major Changes

Spansion Publication Number: DS07-16615-2E

Page	Section	Change Results
31	Port Multiplexing	Corrected the text bubbles in Figure “3. Multiplex Pinout MB91F465PA”.
32		Corrected the text bubbles in Figure “4. Multiplex Pinout MB91F467PA”.
Rev *B		
-	Marketing Part Numbers changed from an MB prefix to a CY prefix.	
188 189	22. Ordering Information 23. Package Dimension	Package description modified to JEDEC description. (Before) FPT-176P-M07 (After) LQP176
188	22. Ordering Information	Revised the following parts number. Before) MB91F465PAPMC-GSE2 MB91F467PAPMC-GSE2 After) CY91F465PAPMC-GS-UJE2 CY91F467PAPMC-GS-UJE2 Added the following parts number. CY91F465PAPMC-GS-UJE1

NOTE: Please see “Document History” about later revised information.

Document History

Document Title: CY91460P Series FR60 32-bit Microcontroller Document Number: 002-04619				
Revision	**ECN**	**Orig. of Change**	**Submission Date**	**Description of Change**
**	—	AKIH	06/01/2010	Migrated to Cypress and assigned document number 002-04619. No change to document contents or format.
*A	5221463	AKIH	04/14/2016	Updated to Cypress format.
*B	6178926	GSHI	05/18/2016	Revised the following items: Marketing Part Numbers changed from an MB prefix to a CY prefix. 23.Package Dimension 22.Ordering Information For details, please see 25.Major Changes

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at Cypress Locations.
