Add suffix CM for chassis mounting, f.ex. 15DMWE_1203S1.5CM, or suffix RM for rail mounting, f.ex. 15DMWE_1203S1.5RM.

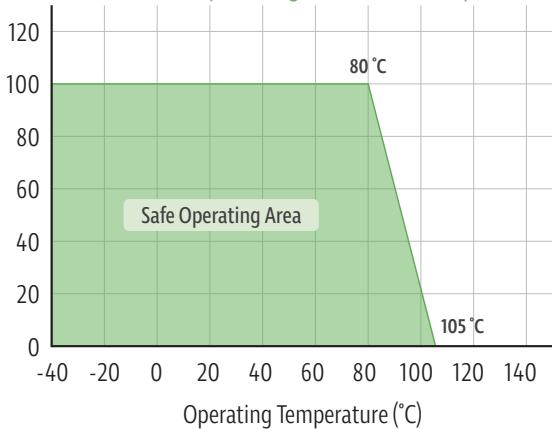

* The minimum input voltage and starting voltage of wiring or rail models are 1VDC higher than those of DIP package due to input reverse polarity protection function.

** Absolute maximum rating without damage on the converter, but it isn't recommended.

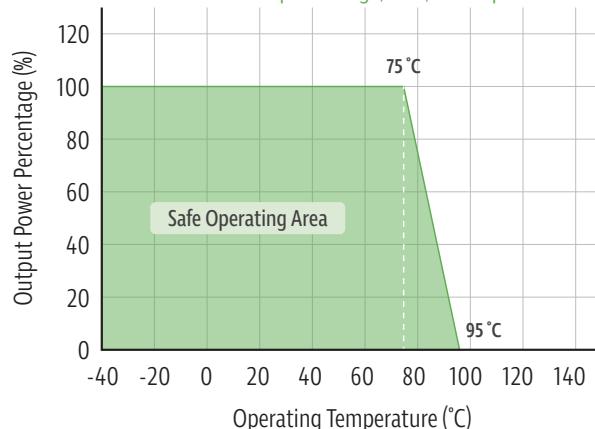

*** Efficiency is measured in nominal input voltage and rated output load; for wiring and rail mounting models, due to input reverse polarity protection, a minimum efficiency greater than Min.-2 is qualified.

Typical application

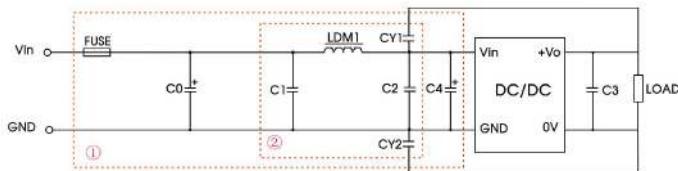

All the DC-DC converters of this series are tested according to the recommended circuit before delivery.

If it is required to further reduce input and output ripple, properly increase the input & output of additional capacitors C_{in} and C_{out} or select capacitors of low equivalent impedance provided that the capacitance is no larger than the max. capacitive load of the product.

Application of trim and calculation of trim resistance

Applied circuits of Trim (Part in broken line is the interior of models)

Calculation formula of Trim resistance:

$$\text{up: } R_t = \frac{\alpha R_2}{R_2 - \alpha} - R_3 \quad \alpha = \frac{V_{ref}}{V_o' - V_{ref}} \cdot R_1$$

$$\text{down: } R_t = \frac{\alpha R_1}{R_1 - \alpha} - R_3 \quad \alpha = \frac{V_o' - V_{ref}}{V_{ref}} \cdot R_2$$

R_t is Trim resistance
 α is a self-defined parameter, with no real meaning.

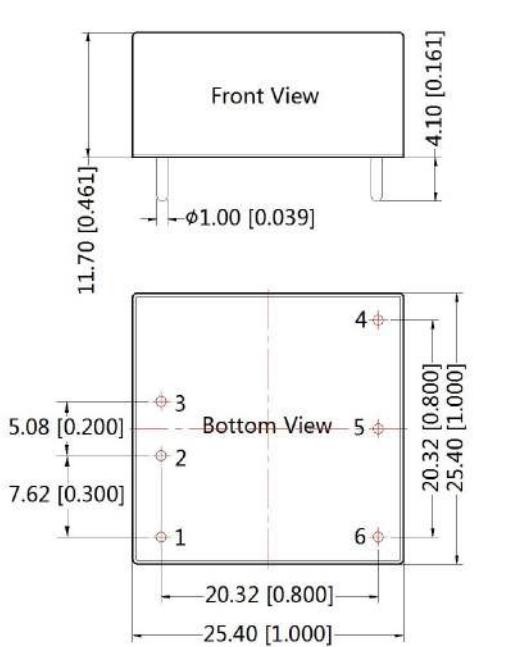

Vout(V)	$R_1(K\Omega)$	$R_2(K\Omega)$	$R_3(K\Omega)$	$V_{ref}(V)$
3.3	4.801	2.87	15	1.24
5	2.894	2.87	10	2.5
12	11.000	2.87	17.4	2.5
15	14.494	2.87	17.4	2.5
24	24.872	2.87	20	2.5

It is not allowed to connect modules output in parallel to enlarge the power.
