

Dual High Efficiency Synchronous MOSFET Driver

Check for Samples: [TPS51601A](#)

FEATURES

- High Voltage Synchronous Buck Driver
- Integrated Boost Switch for Bootstrap Action
- Adaptive Dead Time Control and Shoot-through Protection
- 0.4-Ω Sink Resistance for Low-side Drive
- 1.0-Ω Source Resistance for High-side Drive
- SKIP Pin to Improve Light-Load Efficiency
- Adaptive Zero-Crossing Detection for Optimal Light-Load Efficiency
- 8-Pin 3 mm × 3 mm SON (DRB) Package

DESCRIPTION

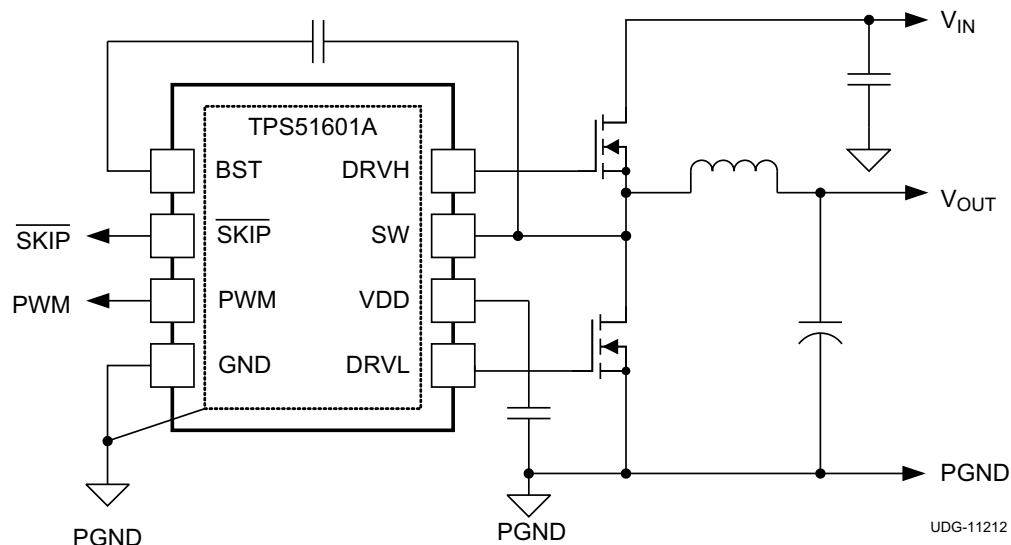

The TPS51601A is a synchronous buck MOSFET driver with integrated boost switch. This high-performance driver is capable of driving high-side and low-side side N-channel FETs with the highest speed and lowest switching loss. Adaptive dead-time control and shoot-through protection are included.

The TPS51601A is available in the space-saving 8-pin 3 mm × 3 mm SON package and operates between -40°C and 105°C.

APPLICATIONS

- Mobile core regulator products
- High frequency DC-DC Converters
- High input voltage DC-DC converters
- Multiphase DC-DC converters

SIMPLIFIED APPLICATION

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION⁽¹⁾⁽²⁾

T _A	PACKAGE	ORDERABLE NUMBER	PINS	TRANSPORT MEDIA	MINIMUM QUANTITY	ECO PLAN
-40°C to 105°C	Plastic Small Outline No-Lead (SON)	TPS51601ADRBT	8	Tape-and-reel (large)	250	Green (RoHS and no Sb/Br)
		TPS51601ADRBR		Tape-and-reel (small)	3000	

- (1) For the most current package and ordering information see the *Package Option Addendum* at the end of this document, or see the TI web site at www.ti.com.
 (2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾⁽²⁾⁽³⁾

		MIN	MAX	UNIT
Input voltage	VDD	-0.3	6	V
	PWM, $\overline{\text{SKIP}}$	-0.3	6	
Output voltages	BST to SW	-0.3	6	V
	DRVH to SW	-0.3	6	
	DRVL	-0.3	6	
	SW	-1	32	
Ground	GND	-0.3	0.3	V
Operating junction temperature, T _J		-40	125	°C
Storage temperature, T _{stg}		-55	150	°C

- (1) Stresses beyond those listed in this table may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated in the **RECOMMENDED OPERATING CONDITIONS** table is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
 (2) All voltage values are with respect to the network ground terminal unless otherwise noted.
 (3) Voltage values are with respect to the corresponding LL terminal.

THERMAL INFORMATION

THERMAL METRIC ⁽¹⁾		TPS51601	UNITS
		DRB	
		8 PINS	
θ_{JA}	Junction-to-ambient thermal resistance ⁽²⁾	42.6	°C/W
θ_{Jctop}	Junction-to-case (top) thermal resistance ⁽³⁾	3.0	
θ_{JB}	Junction-to-board thermal resistance ⁽⁴⁾	18.9	
Ψ_{JT}	Junction-to-top characterization parameter ⁽⁵⁾	62.1	
Ψ_{JB}	Junction-to-board characterization parameter ⁽⁶⁾	19.1	
θ_{Jcbot}	Junction-to-case (bottom) thermal resistance ⁽⁷⁾	12.7	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.
 (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
 (3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
 (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
 (5) The junction-to-top characterization parameter, Ψ_{JT} , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA} , using a procedure described in JESD51-2a (sections 6 and 7).
 (6) The junction-to-board characterization parameter, Ψ_{JB} , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA} , using a procedure described in JESD51-2a (sections 6 and 7).
 (7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

RECOMMENDED OPERATING CONDITIONS

		MIN	TYP	MAX	UNIT
Input voltages	VDD	4.5		5.5	V
	PWM, $\overline{\text{SKIP}}$	-0.1		5.5	
Output voltages	BST to SW	-0.1		5.5	V

DETAILED DESCRIPTION

UVLO

The TPS51601A includes an undervoltage lockout circuit that disables the driver and external power FETs in an OFF state when the input supply voltage, (V_{VDD}) is insufficient to drive external power FET reliably. During the power-up sequence, both gate drive outputs remain low until the VDD voltage reaches UVLO-H threshold, typically 3.7 V. Once the UVLO threshold is reached, the condition of the gate drive outputs is defined by the input PWM and SKIP signals. During the power-down sequence, the UVLO threshold is set lower, typically 3.5 V.

PWM Input

Once the input supply voltage is above the UVLO threshold, the gate drive outputs are defined by the PWM input and $\overline{\text{SKIP}}$ input. Prior to PWM going HIGH, both the gate drive outputs, (DRVH and DRVL) are held LOW. The DRVL is LOW until the first PWM HIGH pulse to support pre-biased start-up. Once PWM goes HIGH for the first time, DRVH goes HIGH. Then, when PWM goes LOW, DRVH goes LOW first. After the non-overlap time, DRVL goes HIGH.

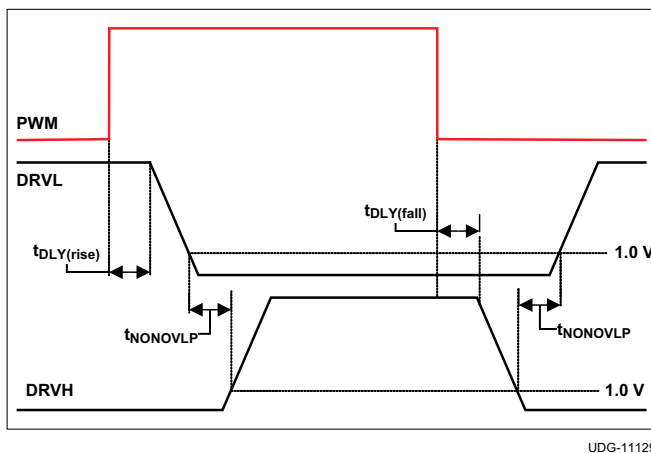

Figure 17. Continuous Conduction Mode Waveforms

Figure 18. Discontinuous Conduction Mode Waveforms

SKIP/FCCM Mode Operation

The TPS51601A can be configured in two ways. When used as the external driver for Phase 1, this pin connects to the corresponding SKIP pin of the PWM controller. The SKIP pin is active low signal. This means when SKIP is low, then the zero crossing detection circuit of the driver is active. When SKIP is high, the zero-crossing detector is disabled and the converter operates in forced continuous conduction mode (FCCM).

Adaptive Zero-Crossing

The TPS51601A has an adaptive zero-crossing detector. Zero crossing accuracy is detected by checking the switch-node voltage at an appropriate time after the low-side FET is turned OFF by DRVL going low. Then the zero-crossing comparator offset is updated based on previous result. After several zero-crossing events, the comparator offset is optimized to give the best efficiency.

Adaptive Dead-Time Control (Anti-Cross Conduction)

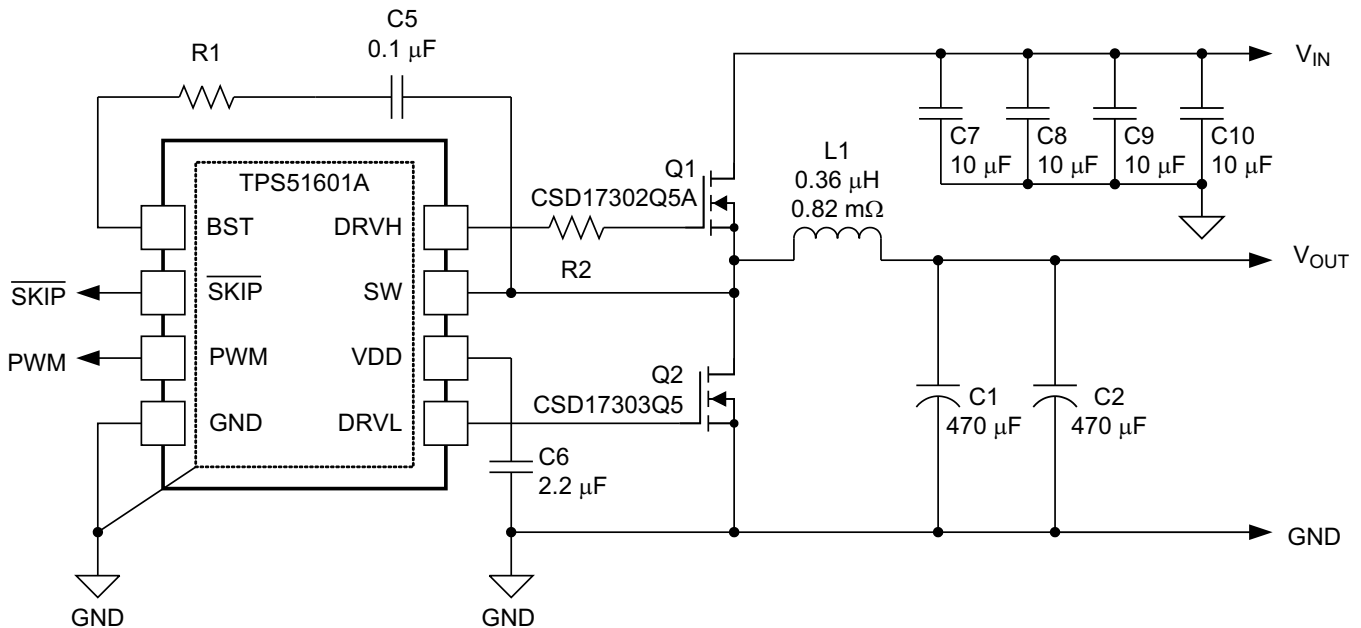

The TPS51601A has an adaptive dead-time control logic to minimize the non-overlap time between DRVH and DRVL signals. The internal signal to the low-side driver goes HIGH only when the DRVH-SW voltage goes below approximately 1 V and DRVH goes below approximately 1 V to ensure the high-side MOSFET has turned OFF. Additional driver delays ensure that there is some non-overlap time between DRVH falling edge and DRVL rising edge. Similarly, the internal signal to the DRVH goes high only after DRVL-GND goes below 1 V.

Integrated Boost-Switch

To maintain a BST-SW voltage close to VDD (to get lower conduction losses on the high-side FET), the conventional diode from VDD to BST is replaced by a FET which is gated by DRVL signal.

APPLICATION INFORMATION

Figure 19 shows a typical application. Resistors R1 and R2 can be used if necessary to reduce the switch-node ringing.

UDG-11214

Figure 19. Typical Application

PCB Layout Guidelines

Figure 20 shows the primary current loops in each phase, numbered in order of importance. The most important loop to minimize the area of is Loop 1, the path from the input capacitor through the high-side and low-side FETs, and back to the capacitor through ground. Loop 2 is from the inductor through the output capacitor, ground and Q2. The layout of the low side gate drive (loops 3a and 3b) is important. The guidelines for gate drive layout are:

- Make the low-side gate drive as short as possible (1 inch or less preferred).
- Make the DRVL width to length ratio of 1:10, wider (1:5) if possible.
- If changing layers is necessary, use at least two vias.
- Decouple VDD to GND (C_D in Figure 20) with at ceramic capacitor with a value of least a 2.2- μ F.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS51601ADRBR	ACTIVE	SON	DRB	8	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 105	601A	Samples
TPS51601ADRBT	ACTIVE	SON	DRB	8	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 105	601A	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
