Class 2: US/Canada

- Option to program output current with Rset resistor
- · Linear or logarithmic dimming curve options

• Program driver with GUI software for fast setup

- Flicker free output for comfort and critical applications
- 2-stage power supply design for better performance over wide range of outputs
- Auxiliary 12Vdc, 200mA output for powering controls
- NTC option allows for themal protection of LED engine
- Adjustable Output Current: 100-1500mA
- UL Dry & Damp Location Rated, Class 2, Type TL
- Dim to zero with 0-10V dimming
- · Metal housing

Power Characteristics

Note: The area under the life-temperature curve represents where the driver has highly reliable operation within specification. Driver performance may drift out of published specifications as the hours of operation exceed the curve at a given temperature. Higher operating temperatures increase the chances of a failure to function. Other electrical, mechanical and environmental factors affect driver lifetime but are not represented in this calculation.

Wiring Connections

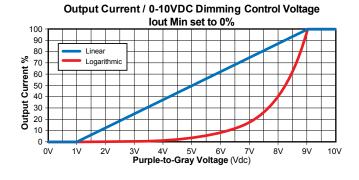

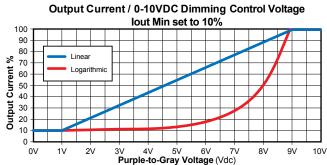

0-10Vdc Dimming

| Parameters | Min | Typical | Max |
|--------------------------------------------------------|--------|---------|--------|
| 12V Auxiliary Output | 11V | 12.0V | 13.0V |
| 12V Auxiliary Output Source Current | 0mA | | 200mA |
| Absolute Voltage Range on 0-10V Input (Purple Wire) | -2.0 V | | +15 V |
| Source Current out of 0-10V Input (Purple Wire) | 0 mA | | 1.5 mA |

Notes:

- Single series strings of LEDs will perform best with deep dimming settings.
- LEDs with parallel strings (discrete component or COB) may not perform well with deep dimming settings.
- Specific LED and driver combinations must be tested to determine the lowest output setting for stable performance.

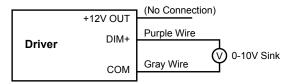

Wiring

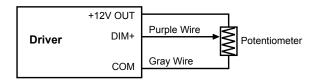

Typical Dimming Circuit: 2-Wire Resistance

(Dimmer must be current-sink type control)

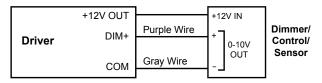

Typical Dimming Circuit: 2-Wire 0-10V Analog

Typical Dimming Circuit: 3-Wire Resistance

Typical Dimming Circuit: 12V Powered Control

Notes:

- 1. Part comes with DIM+, COM & +12V auxiliary connectors. DIM+ and +12V return are connected to COM. This is for controls and sensors that need a 12V supply.
- Part is compatible with most 0-10V Wall Slide dimmers and direct 0-10V analog signal. Recommended dimmer is Leviton IP710 or equivalent connected between Purple and COM wires.
- 3. Output current will be Minimum Programmed Value when Vdim ≤1.00V. If set to 0% then this indicates dim to zero operation.
- 4. Output will be 100% with DIM+/COM open or above 9.0V and Minimum Programmed Value with DIM+/COM Shorted.
- 5. Minimum dimming level is programmable with TRP Programming software.

Reading Resistor Codes

Output Current (mA) vs. Rset (Ohms)

POC Setting: If Rset is open, TRP Programmer GUI can be used to set lout. Output Current vs. Rset or GUI value is within $\pm 5\%$. Rset can be any $\geq 1/4W$, $\pm 1\%$, $\geq 20V$ rated resistor.

¹Rset >9,900 Ohms will default lout to GUI setting.

Rset Table

(nominal output currents)

| Rset (Ω) | lout (mA) |
|----------|-----------|
| 100 | 100 |
| 162 | 130 |
| 230 | 160 |
| 270 | 180 |
| 320 | 200 |
| 395 | 230 |
| 440 | 250 |
| 569 | 300 |
| 698 | 350 |
| 845 | 400 |
| 996 | 450 |
| 1150 | 500 |
| 1490 | 600 |
| 1870 | 700 |
| 2300 | 800 |
| 2800 | 900 |
| 3320 | 1000 |
| 3660 | 1050 |
| 5230 | 1250 |
| 5700 | 1300 |
| 6220 | 1350 |
| 6800 | 1400 |
| 7460 | 1450 |
| 8200 | 1500 |
| 9800 | 1500 |
| 10000 | GUI SET |

Notes:

- 1. Minimum wattage resistor rating is 1/4W leaded.
- 2. Larger wattages can be used for easy installation.
- 3. RSET best placed in LED engine to avoid field replacement programmability issues.
- 4. If RSET is placed on LED engine, SMD 0805 size is recommended.

Module Temperature Protection using External NTC (Negative Temperature Coefficient)

Select a Negative Thermal Coefficient (NTC) resistor with a resistance range that allows the full output current to flow at safe LED operating temperatures.

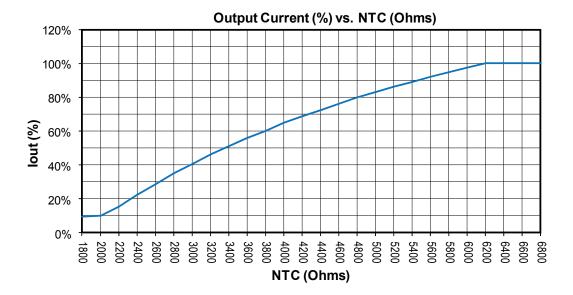

NTC resistance should drop sufficiently to allow reduced output current at elevated or harmful LED temperature levels.

NTC operation should be thoroughly tested to ensure proper operation over all the full temperature range of the Driver and the LED

Example: NTC High, NTC Low and NTC Minimum lout% can be programmed using TRP Programmer USB interface & TRP PC based GUI Software.

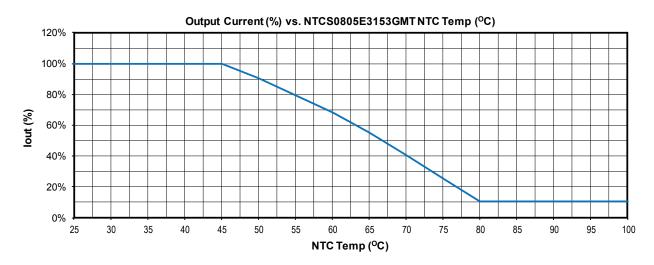

Factory Default Settings: NTC Low = 2.0K \ge 10% lout, NTC High = 6.3K, 100% lout

Programmable settings: NTC Minimum Level (%), NTC Minimum Ohms, NTC Maximum Ohms.

Module Temperature Protection Example

NTC = 805SMD, R $_{\rm 2SC}$ = 15K Ohm \pm 2%, R $_{\rm 64C}$ = 3700, Vishay Part #: NTCS0805E3153GMT With part set: NTC Max = 6.3K, NTC MIN = 2.0K, lout Min = 10%

Programming TRP Drivers NTC

Programmable Output Current (POC): Programmable lout from 100mA to 1500mA

Programmable NTC settings: NTC Minimum Level (%), NTC Minimum Ohms, NTC Maximum Ohms.

Factory Default: NTC Minimum = 2.0K, ~ 10% lout, NTC Maximum = 6.3K, 100% lout

Programmable dimming curve: Linear or LOG Factory Default: Linear Dimming Curve

Programmable Minimum Dim Level: 0% (OFF) to 100% lout programmed value. Factory Default: Min dim level 0%

TRP Programming Tools:

The TRP programming tools consists of programming software along with a special programming cord connected between the USB port of a computer and the TRP programmable LED driver being configured. The TRP programming software is a Windows PC based graphical user interface (GUI) that allows the user to program and configure the operating parameters of a TRP programmable LED driver. This interface allows the operator to set the LED drivers output current within its specified range. It also provides the ability to enable/disable and control features like "Dimming", "Auxiliary Output", "NTC Thermal Protection", "Constant Lumen Module", & "End-of-life indicator" when available in the LED driver being programmed.

Programming Cord (PG1-C3):

This is a specially designed cord adapter with USB connectors for linking the computer and the LED driver being programmed. This unit also provides all power required to the LED driver being programmed. A standard USB cable can be used to extend the length of the Programming Cord from the computer USB port. The micro-USB connector on the Programming Cord must be connected directly to the TRP Programmable Drive.

Programming Software (PG1-SW):

The programmer software is the windows based GUI that allows the user to assign custom part number(s) to the LED driver being programmed. The user can then save the driver profile to an external file and recall as needed. The "Auto Program" feature allows many LED drivers to be programmed to the same stored profile. This can be done by plugging the cord to each driver and a single click of the mouse. The programmer software supports bar code scanners. The barcode scanner can be used to automate the programming of the attached LED driver. This barcode scanner interface also provides an option to either enable or disable logging of the parameters to an Excel file.

Notes:

- Download the PG1-SW software from the TRP website: http://trpssl.com/driver_downloads.html
- The programming of the LED driver does not require the input be connected to an AC power connection. The TRP Programming
 Tool and the required LED driver circuitry will be powered from the programmer module via the USB connection to a computer.
- For new GUI settings to take effect the AC input must be cycled off/on and the USB interface disconnected.

Labeling Programmable Drivers:

It is highly recommended that the drivers be labeled with information traceable to the programming profile. It can include the programmed output current, dimming curve type, minimum dimming level and name of the file storing the profile. *This information is critical to answering any field questions from the contractor or end user.*

| Programmable Parameters | | | | | | | | |
