L93PI

## QUAD LOW SIDE DRIVER

- WIDE INPUT VOLTAGE RANGE -24V UP TO +45V
- WIDE OPERATING SUPPLY VOLTAGE RANGE FROM 4.5V UP TO 32V
- REVERSE BIASING PROTECTED (V_S = -24V)
- VERY LOW STANDBY QUIESCENT CURRENT < 2μA
- PROGRAMMABLE SIGNAL TRANSFER POLARITY
- TTL AND CMOS COMPATIBLE INPUTS
- DEFINED OUTPUT OFF STATE OFF FOR OPEN INPUTS
- FOUR OPEN DRAIN DMOS OUTPUTS, WITH R_{DSon} = 1.5 Ω at 25℃ and V_S > 6V
- OUTPUT CURRENT LIMITATION
- CONTROLLED OUTPUT SLOPE FOR LOW EMI
- OVERTEMPERATURE SHUT-DOWN
- INTEGRATED OUTPUT CLAMPING FOR FAST INDUCTIVE RECIRCULATION V_{FB} > 45V
- STATUS MONITORING FOR
  - OVERTEMPERATURE

SO20 (12+4+4)

ORDERING NUMBER: L93PI

- DISCONNECTED GROUND OR SUPPLY VOLTAGE
- ESD: ALL PINS ARE GUARANTEED TILL 2kV HUMAN BODY MODEL

DESCRIPTION

The L93PI is a monolithic integrated quad low side driver realized in advanced Multipower-BCD technology. It is intended to drive lines, lamps or relais in automotive or industrial applications.

CIRCUIT DESCRIPTION

The L93PI is a quad low side driver for lines, lamps or inductive loads in automotive and industrial applications.

All INputs are TTL or CMOS compatible. This allows the device to be driven directly by a microcontroller. For the noise immunity, all inputs have a Schmitt-trigger with a hysteresis of typ. 100mV. Each input stage has an input voltage protection from -24V to 45V. The device can be activated with a 'high' signal on ENable input. ENable 'low' switches the device into the sleep mode. In this mode the quiescent current is less than 10μA. A high signal on PRoGramming input changes the signal transfer polarity from noninverting into the inverting mode. Normally this pin is connected to V_S or GND. These pins (PRG and EN) are internally fixed at low status by open input condition. Independent of the PRoGramming input, the OUTput switches off, if the signal INput pin is not connected.

Each output driver has a current limitation of min 0.4A and a seperate thermal shut-down. The thermal shut-down deactivates that output which exceeds Temperature switch off level. About 20K below this temperature threshold the output will be activated again. This means, that each output is able to sink continuously 285mA without activating thermal shut-down at 85°C ambient temperature (SO20). The slew rate of the output is limited to max. 14V/μs to reduce the electromagnetic interference, but not for the enable transfer characteristic (see fig. 1). An integrated active flyback voltage limitation clamps the output voltage during the flyback phase of inductive loads to typ. 50V. The power DMOS switches ON, if the device is enabled and the OUTput swings below ground. This protection avoids the activation of parasitics inside the power DMOS.

The DIAGnostic is an open drain output. The logic status depends on the PRoGramming pin. If the PRG pin is 'low' the DIAG output becomes low, if the device works correctly.

At thermal shut-down of one channel, disconnected ground or supply voltage the DIAGnostic output becomes high. If the PRG pin is 'high' this output is switched off at normal function and switched on at overtemperature.

DIAGNOSTIC TABLE

| Pins	EN	PRG	IN	OUT	DIAG
Normal function	H	L	L	L (on)	L (on)
	H	L	H	H (off)	L (on)
	H	H	L	H (off)	H(off)
	H	H	H	L (on)	H(off)
	L	X	X	H (off)	H(off)
Overtemperature, disconnected ground or supply voltage	H	L	X	H (off) *	H (off)
Overtemperature	H	H	X	H (off) *	L (on)

X = not relevant * selective for each channel at overtemperature
