

DC348A Introduction

Description

Demonstration circuit DC348 demonstrates the low power LTC1878 monolithic synchronous regulator in a power supply optimized for cellular phone applications. The LTC1878 is ideal for this application because of its 550kHz switching frequency, low quiescent current (power) consumption, and small package size (MSOP). The DC supply current is typically 10 μ A at no load and less than 1 μ A in shutdown. The high switching frequency allows the use of tiny surface mount components. With an input voltage range of 2.65V to 6V, the LTC1878 is ideally suited for Lithium-Ion Battery applications.

Quick Start Guide

It is easy to set up DC348 to evaluate the performance of the LTC1878. Please follow the procedure outlined below for proper operation.

1. Connect the input power supply to the V_{IN} and GND terminals. Refer to Figure 1 for proper measurement equipment setup.
2. Connect the load between the V_{OUT} and GND terminals.
3. To shut down the circuit, connect the RUN/SS pin to ground.
4. For synchronized operation, connect the clock signal between the SYNC and GND terminals
