## Output Trim Equations

Equations for calculating the trim resistor are shown below. The Trim Down resistor should be connected between the Trim pin and Sense(-) pin. The Trim Up resistor should be connected between the Trim pin and the Sense(+) pin. Only one of the resistors should be used for any given application.

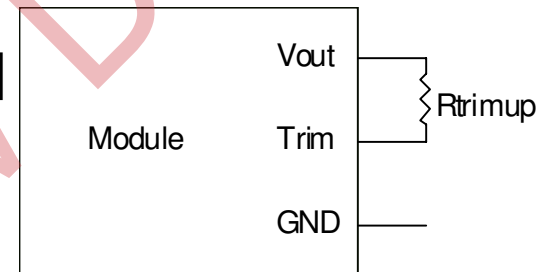

$$R_{trimdown} = \frac{511}{|\delta|} - 10.22 [k\Omega]$$

**Connecting** an external resistor between the TRIM pin and the Sense (-) pin decreases the output voltage set point.

$$R_{trimup} = \frac{(100 + \delta) \cdot V_o \cdot 5.11}{0.6125 \cdot \delta} - \frac{511}{\delta} - 10.22 [k\Omega]$$

**Connecting** an external resistor between the TRIM pin and the Sense (+) pin increases the output voltage set point.

**Note:**

$$\delta = \frac{(V_o_{req} - V_o)}{V_o} \times 100 [\%]$$

$V_o_{req}$  = Desired (trimmed) output voltage [V]  
Output voltage  $V_o = 1.2$  V

Remote sense minimizes the effects of distribution losses by regulating the voltage at the remote-sense connections. The voltage between the remote-sense pins and the output terminals must not exceed the output voltage sense range:  $\leq 10\% \times V_{out}$ . If not using the remote-sense feature to regulate the output voltage at the point of load, connect SENSE (+) to Vout and SENSE (-) to GND at the module. The tracks, that connect the sense pins to the load, must have a resistance  $\ll$  than 10 ohm (for example maximum 100 mOhm).
