# MCC 172 IEPE Measurement DAQ HAT for Raspberry Pi<sup>®</sup>

The MCC 172 is a 24-bit DAQ HAT for making sound and vibration measurements from IEPE sensors. The MCC 172 is shown connected to a Raspberry Pi (not included).

# **Overview**

The MCC 172 is a voltage HAT (Hardware Attached on Top) board designed for use with Raspberry Pi, the most popular single-board computer on the market today.

A HAT is an add-on board with a 40W GPIO (general purpose input/output) connector that conforms to the Raspberry Pi HAT specification.

The MCC 172 HAT provides two analog inputs for sound or vibration measurements. Up to eight MCC HATs can be stacked onto one Raspberry Pi.

# **Raspberry Pi Interface**

The MCC 172 header plugs into the 40-pin general purpose I/O (GPIO) connector on a user-supplied Raspberry Pi. The MCC 172 was tested for use with all Raspberry Pi models with the 40-pin GPIO connector.

# **HAT Configuration**

HAT configuration parameters are stored in an on-board EEPROM that allows the Raspberry Pi to automatically set up the GPIO pins when the HAT is connected.

### **Stackable HATs**

Up to eight MCC HAT boards can be stacked onto a single Raspberry Pi.

Users can mix and match MCC HAT models in the stack.

# **Analog Input**

The two 24-bit differential analog input channels simultaneously acquire data at rates up 51.2 kS/s. Users can turn IEPE excitation current on or off.

Each channel has a dedicated A/D converter. Both ADCs share the same clock and are synchronized to start conversions at the same time for synchronous data.

# Multiple HAT Synchronization

Multiple MCC 172 HATs can be synchronized to a single sampling clock. The clock is programmable for sampling rates between 51.2 kS/s to 200 S/s.

### **Sample Rates**

- Single-board: max throughput is 102.4 kS/s (51.2 kS × 2 channels)
- Stacked boards: max throughput is 307.2 kS/s aggregate<sup>1</sup>.

# **Digital Trigger**

The trigger input (terminal TRIG) is used to delay an input scan until a specified condition is met at the trigger input.

The trigger input signal may be a 3.3V or 5V TTL or CMOS logic signal. The input condition may be edge or level sensitive, rising or falling edge, or high or low level. This terminal may be used to trigger the start of an acquisition on multiple synchronized MCC 172 HATs.

# Power

The MCC 172 is powered with 5 V provided by the Raspberry Pi through the GPIO header connector.

### **Features**

- Two IEPE inputs
  - Two 24-bit, 51.2 kS/s A/D converters (one per channel)
  - AC coupled at ±5 V
  - 10-32 and screw terminal connections for OEM support
- Synchronous ADC conversions between multiple boards
- Onboard sample buffers allow high-speed acquisition
- External digital trigger input
- Stack up to eight MCC HATs onto a single Raspberry Pi

#### Software

• MCC DAQ HAT Library; available on GitHub

### **Supported Operating Systems**

• Linux<sup>®</sup>/Raspbian

#### **Programming API**

• C, C++, Python

# **OEM Support**

Users can connect analog input signals to either the 10-32 coaxial inputs or to the screw terminals. Only one source may be connected to a channel at a time.

# **MCC DAQ HAT Library**

The open-source MCC DAQ HAT Library of commands in C/C++ and Python allows users to develop applications on the Raspberry Pi using Linux.

The library is available to download from <u>GitHub</u>. Comprehensive API and hard-ware <u>documentation</u> is available.

The MCC DAQ HAT Library supports operation with multiple MCC DAQ HATs running concurrently.

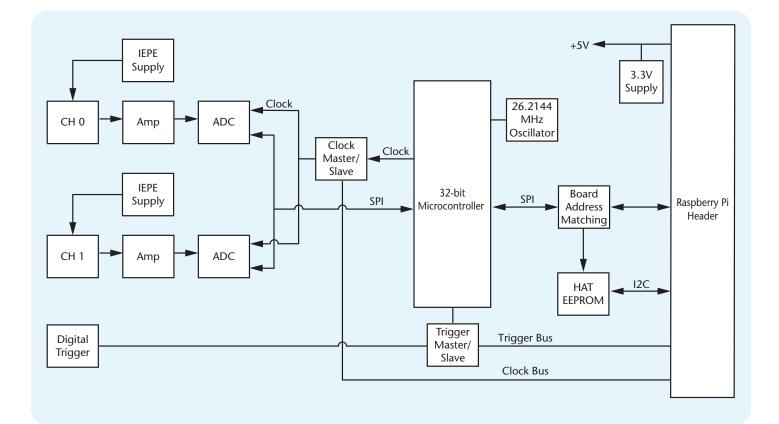

Console-based and user interface (UI) example programs are available for each API.

(508) 946-5100

<sup>1</sup> Dependent on the load on the Raspberry Pi and the SPI interface.

# MCC 172 Block Diagram

# Stackable

Connect up to eight MCC DAQ HATs onto a single Raspberry Pi.

Onboard jumpers identify each board in the stack.

# MCC 172 Example Programs

# **MCC DAQ HAT Examples**

The MCC DAQ HAT Library includes example programs developed in C/C++ and Python that users can run to become familiar with the DAQ HAT library and boards; source code is included.

# Console-Based (C/C++ and Python)

Console-based examples are provided that demonstrate how to perform FFT on a block of data, acquire synchronous data from multiple MCC 172 HATs using shared clock and trigger options, trigger a finite scan, and synchronously acquire data from multiple DAQ HATs. Source code is included.

The fft\_scan example is shown here.

FFT data is saved to a csv file

# User Interface

Example programs featuring a user interface are provided in different formats. Examples of each are shown here.

### Data Logger (C/C++)

The data logger example shows how to acquire data from the MCC 172, display the data on a strip chart, and log the data to a CSV file. This example can be run from the terminal.

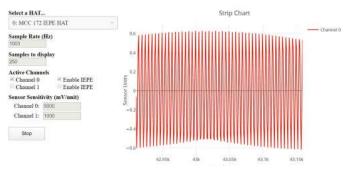

Configure options, plot data on a strip chart, and log data to a file

#### Web Server (Python)

The web server example lets users configure acquisition options and view acquired data from a browser window. This example is written for Python (source included).

#### MCC 172 DAQ HAT Web Server Example

Configure options and view strip chart data from your browser

# MCC 172 Specifications

All specifications are subject to change without notice. Typical for 25 °C unless otherwise specified.
