

MSP430G2x44 Mixed-Signal Microcontrollers

1 Device Overview

1.1 Features

- Low Supply-Voltage Range: 1.8 V to 3.6 V
- Ultra-Low Power Consumption
 - Active Mode: 270 μ A at 1 MHz, 2.2 V
 - Standby Mode: 1 μ A
 - Off Mode (RAM Retention): 0.1 μ A
- Ultra-Fast Wakeup From Standby Mode in Less Than 1 μ s
- 16-Bit RISC Architecture, 62.5-ns Instruction Cycle Time
- Basic Clock Module Configurations
 - Internal Frequencies up to 16 MHz With Four Calibrated Frequencies
 - Internal Very-Low-Power Low-Frequency (LF) Oscillator
 - 32-kHz Crystal
 - High-Frequency (HF) Crystal up to 16 MHz
 - Resonator
 - External Digital Clock Source
 - External Resistor
- 16-Bit Timer_A With Three Capture/Compare Registers
- 16-Bit Timer_B With Three Capture/Compare Registers
- Universal Serial Communication Interface (USCI)
 - Enhanced UART Supports Automatic Baud-Rate Detection (LIN)
 - IrDA Encoder and Decoder
 - Synchronous SPI
 - I²C
- 10-Bit 200-kSPS Analog-to-Digital Converter (ADC) With Internal Reference, Sample-and-Hold, Autoscan, and Data Transfer Controller
- Brownout Detector
- Serial Onboard Programming, No External Programming Voltage Needed, Programmable Code Protection by Security Fuse
- Bootstrap Loader (BSL)
- On-Chip Emulation Module

1.3 Description

The Texas Instruments MSP430™ family of ultra-low-power microcontrollers consists of several devices featuring different sets of peripherals targeted for various applications. The architecture, combined with five low-power modes, is optimized to achieve extended battery life in portable measurement applications. The device features a powerful 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency. The digitally controlled oscillator (DCO) allows the device to wake up from low-power modes to active mode in less than 1 μ s.

The MSP430G2x44 series is an ultra-low-power mixed-signal microcontroller with two built-in 16-bit timers, a universal serial communication interface (USCI), 10-bit analog-to-digital converter (ADC) with integrated reference and data transfer controller (DTC), and 32 I/O pins.

Typical applications include sensor systems that capture analog signals, convert them to digital values, and then process the data for display or for transmission to a host system. Stand-alone radio-frequency (RF) sensor front ends are another area of application.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE ⁽²⁾ |
|----------------|------------|--------------------------|
| MSP430G2744DA | TSSOP (38) | 12.5 mm x 6.2 mm |
| MSP430G2744RHA | VQFN (40) | 6 mm x 6 mm |
| MSP430G2744YFF | DSBGA (49) | 3.1 mm x 3.1 mm |
| MSP430G2744N | PDIP (40) | 52.46 mm x 13.71 mm |

5 Specifications

5.1 Absolute Maximum Ratings⁽¹⁾⁽²⁾

| | MIN | MAX | UNIT |
|---|------|----------------|------|
| Voltage applied at V_{CC} | -0.3 | 4.1 | V |
| Voltage applied to any pin ⁽³⁾ | -0.3 | $V_{CC} + 0.3$ | V |
| Diode current at any device terminal | | ± 2 | mA |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to V_{SS} .
- (3) The JTAG fuse-blow voltage, V_{FB} , is allowed to exceed the absolute maximum rating. The voltage is applied to the TEST pin when blowing the JTAG fuse.

5.2 Handling Ratings

| | MIN | MAX | UNIT |
|--|-----|-----|------|
| T_{stg} | | | |
| Storage temperature (programmed or unprogrammed device) ⁽¹⁾ | -55 | 150 | °C |

- (1) Higher temperature may be applied during board soldering process according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

5.3 Recommended Operating Conditions⁽¹⁾⁽²⁾

Typical values are specified at $V_{CC} = 3.3$ V and $T_A = 25^\circ\text{C}$ (unless otherwise noted)

| | | | MIN | NOM | MAX | UNIT | |
|--------------|--|---|--|-----|------|------|---|
| V_{CC} | Supply voltage | $AV_{CC} = DV_{CC} = V_{CC}$ | During program execution | | 1.8 | 3.6 | V |
| | | | During program and erase of flash memory | | 2.2 | 3.6 | V |
| V_{SS} | Supply voltage | $AV_{SS} = DV_{SS} = V_{SS}$ | | 0 | | V | |
| T_A | Operating free-air temperature | | -40 | | 85 | °C | |
| f_{SYSTEM} | Processor frequency (maximum MCLK frequency) ⁽¹⁾⁽²⁾ (see Figure 5-1) | $V_{CC} = 1.8$ V, Duty cycle = 50% \pm 10% | dc | | 4.15 | MHz | |
| | | $V_{CC} = 2.7$ V, Duty cycle = 50% \pm 10% | dc | | 12 | | |
| | | $V_{CC} \geq 3.3$ V, Duty cycle = 50% \pm 10% | dc | | 16 | | |

- (1) The MSP430 CPU is clocked directly with MCLK. Both the high and low phase of MCLK must not exceed the pulse width of the specified maximum frequency.
- (2) Modules might have a different maximum input clock specification. See the specification of the respective module in this data sheet.

NOTE: Minimum processor frequency is defined by system clock. Flash program or erase operations require a minimum V_{CC} of 2.2 V.

| | | | 3 V | 0.75 | | 1.65 | |
| V _{hys} | Input voltage hysteresis (V _{IT+} - V _{IT-}) | | 3 V | 0.3 | | 1 | V |
| R _{Pull} | Pullup or pulldown resistor | For pullup: V _{IN} = V _{SS} , For pulldown: V _{IN} = V _{CC} | 3 V | 20 | 35 | 50 | kΩ |
| C _I | Input capacitance | V _{IN} = V _{SS} or V _{CC} | | | 5 | | pF |

5.8 Leakage Current, Ports Px

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | V _{CC} | MIN | TYP | MAX | UNIT |
|------------------------|--------------------------------|-----------------|-----------------|-----|-----|-----|------|
| I _{lkg(Px.y)} | High-impedance leakage current | (1) (2) | 3 V | | | ±50 | nA |

- (1) The leakage current is measured with V_{SS} or V_{CC} applied to the corresponding pin(s), unless otherwise noted.
 (2) The leakage of the digital port pins is measured individually. The port pin is selected for input and the pullup or pulldown resistor is disabled.

5.9 Outputs, Ports Px

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | V _{CC} | MIN | TYP | MAX | UNIT |
|-----------------|---------------------------|---|-----------------|-----|-----------------------|-----|------|
| V _{OH} | High-level output voltage | I _{OH(max)} = -6 mA ⁽¹⁾ | 3 V | | V _{CC} - 0.3 | | V |
| V _{OL} | Low-level output voltage | I _{OL(max)} = 6 mA ⁽¹⁾ | 3 V | | V _{SS} + 0.3 | | V |

- (1) The maximum total current, I_{OH(max)} and I_{OL(max)}, for all outputs combined, should not exceed ±48 mA to hold the maximum voltage drop specified.

5.10 Output Frequency, Ports Px

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | V _{CC} | MIN | TYP | MAX | UNIT |
|-----------------------|-----------------------------------|---|-----------------|-----|-----|-----|------|
| f _{Px.y} | Port output frequency (with load) | Px.y, C _L = 20 pF, R _L = 1 kΩ against V _{CC} /2 ⁽¹⁾⁽²⁾ | 3 V | | 12 | | MHz |
| f _{Port_CLK} | Clock output frequency | Px.y, C _L = 20 pF ⁽²⁾ | 3 V | | 16 | | MHz |

- (1) Alternatively, a resistive divider with two 2-kΩ resistors between V_{CC} and V_{SS} is used as load. The output is connected to the center tap of the divider.
 (2) The output voltage reaches at least 10% and 90% V_{CC} at the specified toggle frequency.

5.12 POR and BOR⁽¹⁾⁽²⁾

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | V _{CC} | MIN | TYP | MAX | UNIT |
|-------------------------|--|------------------------------|-----------------|-----|----------------------------|-----|------|
| V _{CC(start)} | See Figure 5-8 | dV _{CC} /dt ≤ 3 V/s | | | 0.7 × V _(B_IT-) | | V |
| V _(B_IT-) | See Figure 5-8 through Figure 5-10 | dV _{CC} /dt ≤ 3 V/s | | | 1.35 | | V |
| V _{hys(B_IT-)} | See Figure 5-8 | dV _{CC} /dt ≤ 3 V/s | | | 140 | | mV |
| t _{d(BOR)} | See Figure 5-8 | | | | 2000 | | μs |
| t _(reset) | Pulse duration needed at $\overline{\text{RST}}/\text{NMI}$ pin to accept reset internally | | 2.2 V | 2 | | | μs |

- (1) The current consumption of the brownout module is already included in the I_{CC} current consumption data. The voltage level V_(B_IT-) + V_{hys(B_IT-)} is ≤ 1.8 V.
- (2) During power up, the CPU begins code execution following a period of t_{d(BOR)} after V_{CC} = V_(B_IT-) + V_{hys(B_IT-)}. The default DCO settings must not be changed until V_{CC} ≥ V_{CC(min)}, where V_{CC(min)} is the minimum supply voltage for the desired operating frequency.

- (1) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
 - Keep the trace between the device and the crystal as short as possible.
 - Design a good ground plane around the oscillator pins.
 - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
 - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
 - Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
 - If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.
 - Do not route the XOUT line to the JTAG header to support the serial programming adapter as shown in other documentation. This signal is no longer required for the serial programming adapter.
- (2) Includes parasitic bond and package capacitance (approximately 2 pF per pin). Because the PCB adds additional capacitance, it is recommended to verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the crystal that is used.
- (3) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications might set the flag.
- (4) Measured with logic-level input frequency but also applies to operation with crystals.

- (1) The leakage current is defined in the leakage current table with Px.x/Ax parameter.
- (2) The analog input voltage range must be within the selected reference voltage range V_{R+} to V_{R-} for valid conversion results.
- (3) The internal reference supply current is not included in current consumption parameter I_{ADC10}.
- (4) The internal reference current is supplied from terminal AVCC. Consumption is independent of the ADC10ON control bit, unless a conversion is active. The REFON bit enables the built-in reference to settle before starting an A/D conversion.

| I _{VeREF-} | Static input current into VeREF- | 0 V ≤ V _{eREF-} ≤ V _{CC} | 3 V | | ±1 | | μA |

- (1) The external reference is used during conversion to charge and discharge the capacitance array. The input capacitance, C_I, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 10-bit accuracy.
- (2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (3) Under this condition, the external reference is internally buffered. The reference buffer is active and requires the reference buffer supply current I_{REFB}. The current consumption can be limited to the sample and conversion period with REBURST = 1.
- (4) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
- (5) The accuracy limits the minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.

| t _{ADC10ON} | Turn on settling time of the ADC ⁽¹⁾ | | | | | 100 | ns |

- (1) The condition is that the error in a conversion started after t_{ADC10ON} is less than ±0.5 LSB. The reference and input signal are already settled.

5.33 10-Bit ADC, Linearity Parameters⁽¹⁾

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | V _{CC} | MIN | TYP | MAX | UNIT |
|----------------|------------------------------|--|-----------------|-----|------|-----|------|
| E _I | Integral linearity error | SREFx = 010 | 3 V | | | ±1 | LSB |
| E _D | Differential linearity error | SREFx = 010 | 3 V | | | ±1 | LSB |
| E _O | Offset error | Source impedance R _S < 100 Ω, SREFx = 010 | 3 V | | | ±1 | LSB |

| E _T | Total unadjusted error | SREFx = 010 | 3 V | | ±2 | ±6 | LSB |

(1) Using the integrated reference buffer (SREFx = 010) increases the gain, and offset and total unadjusted error.

5.34 10-Bit ADC, Temperature Sensor and Built-In V_{MID}⁽¹⁾

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | V _{CC} | MIN | TYP | MAX | UNIT |
|-----------------------------|---|--|-----------------|------|------|----------------|-------|
| I _{SENSOR} | Temperature sensor supply current ⁽¹⁾ | REFON = 0, INCHx = 0Ah, T _A = 25°C | 3 V | | 60 | | μA |
| TC _{SENSOR} | | ADC10ON = 1, INCHx = 0Ah ⁽²⁾ | 3 V | | 3.55 | | mV/°C |
| t _{SENSOR(sample)} | Sample time required if channel 10 is selected ⁽³⁾ | ADC10ON = 1, INCHx = 0Ah, Error of conversion result ≤ 1 LSB | 3 V | 30 | | | μs |
| I _{VMID} | Current into divider at channel 11 | ADC10ON = 1, INCHx = 0Bh | 3 V | | | ⁽³⁾ | μA |
| V _{MID} | V _{CC} divider at channel 11 | ADC10ON = 1, INCHx = 0Bh, V _{MID} ≈ 0.5 × V _{CC} | 3 V | | 1.5 | | V |
| t _{VMID(sample)} | Sample time required if channel 11 is selected ⁽⁴⁾ | ADC10ON = 1, INCHx = 0Bh, Error of conversion result ≤ 1 LSB | 3 V | 1220 | | | ns |

- (1) The sensor current I_{SENSOR} is consumed if (ADC10ON = 1 and REFON = 1), or (ADC10ON = 1 and INCH = 0Ah and sample signal is high). When REFON = 1, I_{SENSOR} is included in I_{REF+}. When REFON = 0, I_{SENSOR} applies during conversion of the temperature sensor input (INCH = 0Ah).
- (2) The following formula can be used to calculate the temperature sensor output voltage:

$$V_{\text{Sensor,typ}} = TC_{\text{Sensor}} (273 + T [^{\circ}\text{C}]) + V_{\text{Offset,sensor}} [\text{mV}]$$
or

$$V_{\text{Sensor,typ}} = TC_{\text{Sensor}} T [^{\circ}\text{C}] + V_{\text{Sensor}}(T_A = 0^{\circ}\text{C}) [\text{mV}]$$
- (3) No additional current is needed. The V_{MID} is used during sampling.
- (4) The on time, t_{VMID(on)}, is included in the sampling time, t_{VMID(sample)}; no additional on time is needed.

5.35 Flash Memory

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | V _{CC} | MIN | TYP | MAX | UNIT |
|-----------------------------|---|-----------------------|-----------------|-----------------|-----------------|-----|------------------|
| V _{CC (PGM/ERASE)} | Program and erase supply voltage | | | 2.2 | | 3.6 | V |
| f _{FTG} | Flash timing generator frequency | | | 257 | | 476 | kHz |
| I _{PGM} | Supply current from V _{CC} during program | | 2.2 V, 3.6 V | | 1 | 5 | mA |
| I _{ERASE} | Supply current from V _{CC} during erase | | 2.2 V, 3.6 V | | 1 | 7 | mA |
| t _{CPT} | Cumulative program time ⁽¹⁾ | | 2.2 V, 3.6 V | | | 10 | ms |
| t _{CMErase} | Cumulative mass erase time | | 2.2 V, 3.6 V | 20 | | | ms |
| | Program and erase endurance | | | 10 ⁴ | 10 ⁵ | | cycles |
| t _{Retention} | Data retention duration | T _J = 25°C | | 100 | | | years |
| t _{Word} | Word or byte program time | (2) | | | 30 | | t _{FTG} |
| t _{Block, 0} | Block program time for first byte or word | (2) | | | 25 | | t _{FTG} |
| t _{Block, 1-63} | Block program time for each additional byte or word | (2) | | | 18 | | t _{FTG} |
| t _{Block, End} | Block program end-sequence wait time | (2) | | | 6 | | t _{FTG} |
| t _{Mass Erase} | Mass erase time | (2) | | | 10593 | | t _{FTG} |
| t _{Seg Erase} | Segment erase time | (2) | | | 4819 | | t _{FTG} |

- (1) The cumulative program time must not be exceeded when writing to a 64-byte flash block. This parameter applies to all programming methods: individual word write, individual byte write, and block write modes.

- (2) These values are hardwired into the state machine of the flash controller (t_{FTG} = 1/f_{FTG}).

5.36 RAM

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | MAX | UNIT |
|---------------------|---|-----------------|-----|-----|------|
| V _(RAMh) | RAM retention supply voltage ⁽¹⁾ | CPU halted | 1.6 | | V |

- (1) This parameter defines the minimum supply voltage V_{CC} when the data in RAM remains unchanged. No program execution should happen during this supply voltage condition.

5.37 JTAG and Spy-Bi-Wire Interface

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER | | V _{CC} | MIN | TYP | MAX | UNIT |
|-----------------------|--|-----------------|-------|-----|-----|------|
| f _{SBW} | Spy-Bi-Wire input frequency | 2.2 V | 0 | | 20 | MHz |
| t _{SBW,Low} | Spy-Bi-Wire low clock pulse duration | 2.2 V | 0.025 | | 15 | μs |
| t _{SBW,En} | Spy-Bi-Wire enable time (TEST high to acceptance of first clock edge ⁽¹⁾) | 2.2 V | | | 1 | μs |
| t _{SBW,Ret} | Spy-Bi-Wire return to normal operation time | 2.2 V | 15 | | 100 | μs |
| f _{TCK} | TCK input frequency ⁽²⁾ | 2.2 V | 0 | | 5 | MHz |
| R _{Internal} | Internal pulldown resistance on TEST | 2.2 V | 25 | 60 | 90 | kΩ |

- (1) Tools accessing the Spy-Bi-Wire interface need to wait for the maximum t_{SBW,En} time after pulling the TEST/SBWTCK pin high before applying the first SBWTCK clock edge.
- (2) f_{TCK} may be restricted to meet the timing requirements of the module selected.

5.38 JTAG Fuse⁽¹⁾

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | MAX | UNIT |
|---------------------|---|-----------------------|-----|-----|------|
| V _{CC(FB)} | Supply voltage during fuse-blow condition | T _A = 25°C | 2.5 | | V |
| V _{FB} | Voltage level on TEST for fuse blow | | 6 | 7 | V |
| I _{FB} | Supply current into TEST during fuse blow | | | 100 | mA |
| t _{FB} | Time to blow fuse | | | 1 | ms |

- (1) After the fuse is blown, no further access to the JTAG/Test, Spy-Bi-Wire, or emulation feature is possible, and JTAG is switched to bypass mode.

6 Detailed Description

6.1 CPU

The MSP430™ CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses and can be handled with all instructions.

6.2 Instruction Set

The instruction set consists of 51 instructions with three formats and seven address modes. Each instruction can operate on word and byte data. [Table 6-1](#) shows examples of the three types of instruction formats; [Table 6-2](#) shows the address modes.

Table 6-1. Instruction Word Formats

| INSTRUCTION FORMAT | EXAMPLE | OPERATION |

6.3 Operating Modes

The MSP430 microcontrollers have one active mode and five software-selectable low-power modes of operation. An interrupt event can wake up the device from any of the five low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

The following six operating modes can be configured by software:

- Active mode (AM)
 - All clocks are active.
- Low-power mode 0 (LPM0)
 - CPU is disabled.
 - ACLK and SMCLK remain active.
 - MCLK is disabled.
- Low-power mode 1 (LPM1)
 - CPU is disabled.
 - ACLK and SMCLK remain active.
 - MCLK is disabled.
 - DCO dc-generator is disabled if DCO not used in active mode.
- Low-power mode 2 (LPM2)
 - CPU is disabled.
 - ACLK remains active.
 - MCLK and SMCLK are disabled.
 - DCO dc-generator remains enabled.
- Low-power mode 3 (LPM3)
 - CPU is disabled.
 - ACLK remains active.
 - MCLK and SMCLK are disabled.
 - DCO dc-generator is disabled.
- Low-power mode 4 (LPM4)
 - CPU is disabled.
 - ACLK, MCLK, and SMCLK are disabled.
 - DCO dc-generator is disabled.
 - Crystal oscillator is stopped.

6.4 Interrupt Vector Addresses

The interrupt vectors and the power-up starting address are located in the address range of 0FFFFh to 0FFC0h. The vector contains the 16-bit address of the appropriate interrupt handler instruction sequence.

If the reset vector (located at address 0FFFEh) contains 0FFFFh (for example, if flash is not programmed), the CPU goes into LPM4 immediately after power up.

Table 6-3. Interrupt Vector Addresses

- (1) A reset is generated if the CPU tries to fetch instructions from within the module register memory address range (0h to 01FFh) or from within unused address range.
- (2) Multiple source flags
- (3) (non)-maskable: the individual interrupt-enable bit can disable an interrupt event, but the general interrupt enable cannot. Nonmaskable: neither the individual nor the general interrupt-enable bit will disable an interrupt event.
- (4) Interrupt flags are located in the module.
- (5) This location is used as bootstrap loader security key (BSLSKEY). A 0AA55h at this location disables the BSL completely. A zero (0h) disables the erasure of the flash if an invalid password is supplied.
- (6) The interrupt vectors at addresses 0FFDCh to 0FFC0h are not used in this device and can be used for regular program code if necessary.

6.5 Special Function Registers

Most interrupt and module enable bits are collected into the lowest address space. Special function register bits not allocated to a functional purpose are not physically present in the device. Simple software access is provided with this arrangement.

6.7 Bootstrap Loader (BSL)

The MSP430 bootstrap loader (BSL) enables users to program the flash memory or RAM using a UART serial interface. Access to the MSP430 memory via the BSL is protected by user-defined password. For complete description of the features of the BSL and its implementation, see the *MSP430 Programming Via the Bootstrap Loader User's Guide* ([SLAU319](#)).

Table 6-9. BSL Function Pins

| BSL FUNCTION | DA PACKAGE PINS | RHA PACKAGE PINS | YFF PACKAGE PINS |
|---------------------|------------------------|-------------------------|-------------------------|
| Data transmit | 32 - P1.1 | 30 - P1.1 | G3 - P1.1 |
| Data receive | 10 - P2.2 | 8 - P2.2 | A5 - P2.2 |

6.8 Flash Memory

The flash memory can be programmed via the JTAG port, the bootstrap loader, or in-system by the CPU. The CPU can perform single-byte and single-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (A to D) of 64 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually, or as a group with segments 0 to n. Segments A to D are also called *information memory*.
- Segment A contains calibration data. After reset, segment A is protected against programming and erasing. It can be unlocked, but care should be taken not to erase this segment if the device-specific calibration data is required.

6.9 Peripherals

Peripherals are connected to the CPU through data, address, and control buses and can be handled using all instructions. For complete module descriptions, see the *MSP430x2xx Family User's Guide* ([SLAU144](#)).

6.10 Oscillator and System Clock

The clock system is supported by the basic clock module that includes support for a 32768-Hz watch crystal oscillator, an internal very-low-power low-frequency oscillator, an internal digitally-controlled oscillator (DCO), and a high-frequency crystal oscillator. The basic clock module is designed to meet the requirements of both low system cost and low power consumption. The internal DCO provides a fast turn-on clock source and stabilizes in less than 1 μ s. The basic clock module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32768-Hz watch crystal, a high-frequency crystal, or the internal very-low-power LF oscillator.
- Main clock (MCLK), the system clock used by the CPU.
- Sub-Main clock (SMCLK), the sub-system clock used by the peripheral modules.

**Table 6-10. DCO Calibration Data
(Provided From Factory in Flash Information Memory Segment A)**

| DCO FREQUENCY | CALIBRATION REGISTER | SIZE | ADDRESS |
|---------------|----------------------|------|---------|
| 1 MHz | CALBC1_1MHZ | byte | 010FFh |
| | CALDCO_1MHZ | byte | 010FEh |

| | CALDCO_16MHZ | byte | 010F8h |

6.11 Brownout

The brownout circuit is implemented to provide the proper internal reset signal to the device during power on and power off.

6.12 Digital I/O

There are four 8-bit I/O ports implemented—ports P1, P2, P3, and P4:

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt condition is possible.
- Edge-selectable interrupt input capability for all eight bits of port P1 and P2.
- Read and write access to port-control registers is supported by all instructions.
- Each I/O has an individually programmable pullup or pulldown resistor.

6.13 Watchdog Timer (WDT+)

The primary function of the WDT+ module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be disabled or configured as an interval timer and can generate interrupts at selected time intervals.

6.14 Timer_A3

Timer_A3 is a 16-bit timer/counter with three capture/compare registers. Timer_A3 can support multiple capture/compares, PWM outputs, and interval timing. Timer_A3 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.15 Timer_B3

Timer_B3 is a 16-bit timer/counter with three capture/compare registers. Timer_B3 can support multiple capture/compares, PWM outputs, and interval timing. Timer_B3 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.16 Universal Serial Communications Interface (USCI)

The USCI module is used for serial data communication. The USCI module supports synchronous communication protocols like SPI (3 or 4 pin), I2C and asynchronous communication protocols such as UART, enhanced UART with automatic baudrate detection (LIN), and IrDA.

USCI_A0 provides support for SPI (3 or 4 pin), UART, enhanced UART, and IrDA.

USCI_B0 provides support for SPI (3 or 4 pin) and I2C.

6.17 ADC10

The ADC10 module supports fast, 10-bit analog-to-digital conversions. The module implements a 10-bit SAR core, sample select control, reference generator and data transfer controller, or DTC, for automatic conversion result handling allowing ADC samples to be converted and stored without any CPU intervention.

6.19.19 JTAG Fuse Check Mode

MSP430 devices that have the fuse on the TEST terminal have a fuse check mode that tests the continuity of the fuse the first time the JTAG port is accessed after a power-on reset (POR). When activated, a fuse check current, I_{TF} , of 1 mA at 3 V, 2.5 mA at 5 V can flow from the TEST pin to ground if the fuse is not burned. Care must be taken to avoid accidentally activating the fuse check mode and increasing overall system power consumption.

When the TEST pin is again taken low after a test or programming session, the fuse check mode and sense currents are terminated.

Activation of the fuse check mode occurs with the first negative edge on the TMS pin after power up or if TMS is held low during power up. The second positive edge on the TMS pin deactivates the fuse check mode. After deactivation, the fuse check mode remains inactive until another POR occurs. After each POR, the fuse check mode has the potential to be activated.

The fuse check current flows only when the fuse check mode is active and the TMS pin is in a low state (see [Figure 6-1](#)). Therefore, the additional current flow can be prevented by holding the TMS pin high (default condition).

Figure 6-1. Fuse Check Mode Current

NOTE

The CODE and RAM data protection is ensured if the JTAG fuse is blown and the 256-bit bootloader access key is used. Also, see the [Bootstrap Loader](#) section for more information.

7 Device and Documentation Support

7.1 Device Support

7.1.1 Getting Started

For an introduction to the MSP430™ family of devices and the tools and libraries that are available to help with your development, visit the [Getting Started page](#).

7.1.2 Development Tools Support

All MSP430™ microcontrollers are supported by a wide variety of software and hardware development tools. Tools are available from TI and various third parties. See them all at www.ti.com/msp430tools.

7.1.2.1 Hardware Features

See the *Code Composer Studio for MSP430 User's Guide* ([SLAU157](#)) for details on the available features.

| MSP430 Architecture | 4-Wire JTAG | 2-Wire JTAG | Break-points (N) | Range Break-points | Clock Control | State Sequencer | Trace Buffer | LPMx.5 Debugging Support |
|---------------------|-------------|-------------|------------------|--------------------|---------------|-----------------|--------------|--------------------------|
| MSP430 | Yes | Yes | 2 | No | Yes | No | No | No |

7.1.2.2 Recommended Hardware Options

7.1.2.2.1 Target Socket Boards

The target socket boards allow easy programming and debugging of the device using JTAG. They also feature header pin outs for prototyping. Target socket boards are orderable individually or as a kit with the JTAG programmer and debugger included. The following table shows the compatible target boards and the supported packages.

| Package | Target Board and Programmer Bundle | Target Board Only |
|-------------------|------------------------------------|-------------------------------|
| 38-pin TSSOP (DA) | MSP-FET430U38 | MSP-TS430DA38 |

7.1.2.2.2 Experimenter Boards

Experimenter Boards and Evaluation kits are available for some MSP430 devices. These kits feature additional hardware components and connectivity for full system evaluation and prototyping. See www.ti.com/msp430tools for details.

7.1.2.2.3 Debugging and Programming Tools

Hardware programming and debugging tools are available from TI and from its third party suppliers. See the full list of available tools at www.ti.com/msp430tools.

7.1.2.2.4 Production Programmers

The production programmers expedite loading firmware to devices by programming several devices simultaneously.

| Part Number | PC Port | Features | Provider |
|--------------------------|----------------|---|-------------------|
| MSP-GANG | Serial and USB | Program up to eight devices at a time. Works with PC or standalone. | Texas Instruments |

7.1.2.3 Recommended Software Options

7.1.2.3.1 Integrated Development Environments

Software development tools are available from TI or from third parties. Open source solutions are also available.

This device is supported by Code Composer Studio™ IDE (CCS).

7.1.2.3.2 *MSP430Ware*

[MSP430Ware](#) is a collection of code examples, data sheets, and other design resources for all MSP430 devices delivered in a convenient package. MSP430Ware is available as a component of CCS or as a standalone package.

7.1.2.3.3 *Command-Line Programmer*

[MSP430 Flasher](#) is an open-source, shell-based interface for programming MSP430 microcontrollers through a FET programmer or eZ430 using JTAG or Spy-Bi-Wire (SBW) communication. MSP430 Flasher can be used to download binary files (.txt or .hex) files directly to the MSP430 Flash without the need for an IDE.

7.1.3 *Device and Development Tool Nomenclature*

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP430 MCU devices and support tools. Each MSP430 MCU commercial family member has one of three prefixes: MSP, PMS, or XMS (for example, MSP430F5259). Texas Instruments recommends two of three possible prefix designators for its support tools: MSP and MSPX. These prefixes represent evolutionary stages of product development from engineering prototypes (with XMS for devices and MSPX for tools) through fully qualified production devices and tools (with MSP for devices and MSP for tools).

Device development evolutionary flow:

XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

PMS – Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification

MSP – Fully qualified production device

Support tool development evolutionary flow:

MSPX – Development-support product that has not yet completed Texas Instruments internal qualification testing.

MSP – Fully-qualified development-support product

XMS and PMS devices and MSPX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices and MSP development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS and PMS) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, PZP) and temperature range (for example, T). [Figure 7-1](#) provides a legend for reading the complete device name for any family member.

7.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - QFN (Quad Flatpack No-Lead) Package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - Package complies to JEDEC MO-220 variation VJJD-2.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

- NOTES:
- A. All linear dimensions are in millimeters
 - B. The Pin 1 Identification mark is an optional feature that may be present on some devices
In addition, this Pin 1 feature if present is electrically connected to the center thermal pad and therefore should be considered when routing the board layout.

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

 - C. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - D. Contact the board fabrication site for recommended soldermask tolerances.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
