NCP4641

150 mA, Wide Input Range, Voltage Regulator

The NCP4641 is a CMOS 150 mA linear voltage regulator with high input voltage and ultra-low supply current. It incorporates multiple protection features such as peak current limit, short circuit current limit and thermal shutdown to ensure a very robust device.

A high maximum input voltage tolerance of 50 V and a wide temperature range make the NCP4641 suitable for a variety of demanding applications.

Features

- Operating Input Voltage Range: 4 V to 36 V
- Output Voltage Range: 2.0 to 12.0 V (0.1 steps)
- $\pm 2\%$ Output Voltage Accuracy
- Output Current: min 150 mA ($V_{IN} = 8\text{ V}$, $V_{OUT} = 5\text{ V}$)
- Line Regulation: 0.05%/V
- Peak Current Limit Circuit
- Short Current Limit Circuit
- Thermal Shutdown Circuit
- Available in SOT-89-5 and SOIC6-TL Package
- These are Pb-Free Devices

Typical Applications

- Power source for home appliances
- Power source for car audio equipment, navigation system
- Power source for notebooks, digital TVs, cordless phones and private LAN systems
- Power source for office equipment machines such as copiers, printers, facsimiles, scanners, projectors, etc.

APPLICATION INFORMATION

A typical application circuit for NCP4641 series is shown in Figure 32.

Figure 32. Typical Application Schematic

Input Decoupling Capacitor (C1)

The device is stable without any input capacitance, but if input line is long and has high impedance or if more stable operation is needed, input capacitor C1 should be connected as close as possible to the IC. Recommended range of input capacitor value is 100 nF to 10 μ F.

Output Decoupling Capacitor (C2)

The NCP4641 can work stable without output capacitor, but if faster response and higher stability reserve is needed, output capacitor should be connected as close as possible to the device. Recommended range of output capacitance is 100 nF to 10 μ F. Larger values of output capacitance and lower ESR improves dynamic parameters.

Enable Operation

The enable pin CE may be used for turning the regulator on and off. The device is activated when high level is

connected to CE pin. Do not keep CE pin not connected or between VCEH and VCEL voltage levels. Otherwise output voltage would be unstable or indefinite and unexpected would flow internally.

Thermal

As a power across the IC increase, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature affect the rate of temperature increase for the part. When the device has good thermal conductivity through the PCB the junction temperature will be relatively low in high power dissipation applications.

The IC includes internal thermal shutdown circuit that stops operation of regulator, if junction temperature is higher than 150°C. After that, when junction temperature decreases below 125°C, the operation of voltage regulator would restart. While high power dissipation condition is, the regulator starts and stops repeatedly and protects itself against overheating.

PCB Layout

Pins number 2 and 4 of SOT89-5 package and pins number 2, 4 and 5 of SOIC6-TL must be wired to the GND plane while it is mounted on board. Make VIN and GND lines sufficient. If their impedance is high, noise pickup or unstable operation may result. Connect capacitors C1 and C2 as close as possible to the IC, and make wiring as short as possible.
