## Low Profile Overvoltage Protection IC with Integrated MOSFET

This device represents a new level of safety and integration by combining an overvoltage protection circuit (OVP) with a 30 V P-channel power MOSFET, a low  $V_{CE(SAT)}$  transistor, and low  $R_{DS(on)}$  power MOSFET or charging. The OVP is specifically designed to protect sensitive electronic circuitry from overvoltage transients and power supply faults. During such events, the IC quickly disconnects the input supply from the load, thus protecting it. The integration of the additional transistor and power MOSFET reduces layout space and promotes better charging performance.

The IC is optimized for applications that use an external AC-DC adapter or a car accessory charger to power a portable product or recharge its internal batteries.

### Features

- Overvoltage Turn-Off Time of Less Than 1.0  $\mu$ s
- Accurate Voltage Threshold of 6.85 V, Nominal
- Undervoltage Lockout Protection; 2.8 V, Nominal
- High Accuracy Undervoltage Threshold of 2.0%
- -30 V Integrated P-Channel Power MOSFET
- Low  $R_{DS(on)}$  = 50 m $\Omega$  @ -4.5 V
- High Performance -12 V P-Channel Power MOSFET
- Single-Low  $V_{ce(sat)}$  Transistors as Charging Power Mux
- Compact 3.0 x 4.0 mm QFN Package
- Maximum Solder Reflow Temperature @ 260°C
- This is a Pb-Free Device

### Benefits

- Provide Battery Protection
- Integrated Solution Offers Cost and Space Savings
- Integrated Solution Improves System Reliability
- Optimized for Commercial PMUs from Top Suppliers

### Applications

- Portable Computers and PDAs
- Cell Phones and Handheld Products
- Digital Cameras

Figure 2. Typical Charging Solution for Qualcomm QSC60xx

# NUS6189MN

## FUNCTIONAL PIN DESCRIPTIONS

Pin	Function	Description
1	Source 1	This pin is the source of MOSFET1 and connects to the more negative Vsense pin of the PMIC and to the more negative side of the current sense resistor.
2, 16, 17, 21, 22	Batt	These pins are the drain of MOSFET2 and connect to the battery and the Vbat pin of the PMIC.
3	Base	The base of the internal bipolar transistor is connected to this pin. It connects to the Charge Control pin of the PMIC.
4, 5, 6, 7	Collector	The collector of the internal bipolar transistor connects to these pins and should be connected to the more positive side of the current sense resistor as well as the more positive Vsense pin of the PMIC.
8	Emitter	This pin is connected to the emitter of the bipolar transistor. It should be connected externally to the OVP <sub>OUT</sub> pins.
9, 11, 13	OVP <sub>OUT</sub>	These pins are the output of the OVP circuit. Internally they connect to the drain of MOSFET2. These pins connect externally to the Vcharge pin of the PMIC.
10	Gate2	This pin is the gate of MOSFET2. It is not normally connected to external circuitry.
12	Source 2	The source of the OVP FET is connected to this pin. This pin needs to be connected to pins 14 & 15.
14	V <sub>CC</sub>	This pin is the V <sub>CC</sub> pin of the OVP chip. It needs to be connected to pins 12 and 15.
15	V <sub>IN</sub>	This pin senses the output voltage of the charger. If the voltage on this input rises above the over-voltage threshold (V <sub>TH</sub> ), the OVP <sub>OUT</sub> pin will be driven to within 1.0 V of V <sub>IN</sub> , thus disconnecting the FET. The nominal threshold level is 6.85 V. This pin needs to be connected to pins 12 and 14.
18	Gate1	This pin is the gate of MOSFET1. It connects to the Bat FET pin of the PMIC.
19	Gnd	This is the ground reference pin for the OVP chip.
20	Control	This logic signal is used to control the state of OVP <sub>OUT</sub> and turn-on/off the P-channel MOSFET. A logic level high results in the OVP <sub>OUT</sub> signal being driven to within 1.0 V of V <sub>CC</sub> which turns off MOSFET2. If this pin is not used, it should be connected to ground.

# NUS6189MN

## MAXIMUM RATINGS

Rating	Symbol	Value	Unit
$V_{IN}$ to Ground	$V_{IN}$	-0.3 to 30	V
Gate2 Voltage to Ground	$V_{G2}$	-0.3 to 30	V
Control Pin to Ground	$V_{CNTRL}$	-0.3 to 13	V
Shunt Voltage (OVP <sub>OUT</sub> to Batt)	$V_{shunt}$	12	V
Maximum Power Dissipation ( $T_A = 50^\circ\text{C}$ , Notes 1 & 3)	$P_D$	1.2	W
Thermal Resistance, Junction-to-Air (Note 1) Average $\theta$ for chip, minimum copper Maximum $\theta$ for power device, minimum copper Average $\theta$ , for chip (Note 2) Maximum $\theta$ for power device (Note 1) Average $\theta$ for chip (Note 1) Maximum $\theta$ for power device (Note 1)	$\theta_{J-A}$	137 145 98 103 77 82	$^\circ\text{C/W}$
Operating Case Temperature (Note 4)	$T_{Cmax}$	125	$^\circ\text{C}$
Operating Ambient Temperature ( $P_D = 0.5$ W, Note 1)	$T_{Amb}$	109	$^\circ\text{C}$
Operating Junction Temperature (All Dice)	$T_{Jmax}$	150	$^\circ\text{C}$
Thermal Resistance Junction-to-Case (Note 4)	$\Psi_{JC}$	30	$^\circ\text{C/W}$
Storage Temperature Range	$T_{stg}$	-65 to 150	$^\circ\text{C}$
Continuous Input Current ( $T_A = 50^\circ\text{C}$ , Notes 1 & 3)	$I_{max}$	2.6	A
Gate-to-Source Voltage MOSFET1	$V_{GS1}$	$\pm 8.0$	V
Drain-to-Source Voltage MOSFET1	$V_{DS1}$	-12	V
Drain-to-Source Voltage MOSFET2	$V_{DS2}$	-30	V
Collector-Emitter Voltage BJT	$V_{CEO}$	-20	V
Collector-Base Voltage BJT	$V_{CBO}$	-20	V
Emitter-Base Voltage BJT	$V_{EBO}$	-7.0	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Surface-mounted on FR4 board using 1 inch sq pad size (Cu area = 1.127 in sq [1 oz] including traces).
2. Surface-mounted on FR4 board using 0.25 inch sq pad size (Cu area = 0.37 in sq [1 oz] including traces).
3.  $V_{IN} = 6.0$  V, all power devices fully enhanced.
4. Surface-mounted on FR4 board using 400 mm sq pad size, 4 oz Cu,  $P_D < 800$  mW.
