
Features

- 32-kHz Voltage Regulated Oscillator
- 1.1 V to 2.2 V Operating-voltage Range
- Integrated Capacitors for Digital Trimming
- Suitable for up to 12.5 pF Quartz
- Trimming Inputs Insensitive to Stray Capacitance
- Output Pulse Formers
- Mask Options for Motor Period and Pulse Width
- Low Resistance Output for Bipolar Stepping Motor
- Motor Fast-test Function

Description

The e1467D is an integrated circuit in CMOS Silicon Gate Technology for analog clocks. It consists of a 32-kHz oscillator, frequency divider, output pulse formers, push-pull motor drivers and alarm output. Integrated capacitors are mask-selectable to accommodate the external quartz crystal. Additional capacitance can be selected through pad bonding to trimming the oscillator frequency.

Functional Description

Oscillator

An oscillator inverter with feedback resistor is provided to generate the 32768 Hz clock frequency. Values for the fixed capacitors at OSCIN and OSCOUT are mask-selectable (see note 3 of “Operating Characteristics”). Four control inputs, SC1 to SC4, enable the users to add integrated trimming capacitors to OSCIN and OSCOUT, providing 15 tuning steps.

A frequency variation of typically 4 ppm for each tuning step is obtained by bonding the capacitor pads to OSCIN. As none of these pads are bonded, the IC is in an untrimmed state. Figure 2 shows the trimming curve characteristic.

Note: For applications which utilize this integrated trimming feature, Atmel will determine optimum values for the integrated capacitors C_{OSCIN} and C_{OSCOUT} .

Motor Drive Output

The e1467D contains two push-pull output buffers for driving bipolar stepping motors. During a motor pulse, the N-channel device of one buffer and the P-channel device of the other buffer will be activated. Both N-channel transistors are on and conducting between output pulses. The outputs are protected against inductive voltage spikes with diodes to both supply pins. The motor output period and pulse width are mask-programmable, as listed below:

Available motor periods (T_M): 125, 250, 500 ms and 2, 16 s

Available maximum pulse widths (t_M): 15, 6, 23.4, 31.25, 46.9 ms

Available motor periods for motor test (T_{MT}): 250, 500 ms and 1 s

Note: The following constraints for combination of motor period and pulse widths have to be considered: $T_M > 4 \times t_M$, $T_{MT} > 4 \times t_M$ or alternatively $T_M = 2 \times t_M$, $T_{MT} = 2 \times t_M$

Alarm Outputs

The alarm output driver consists of a push-pull stage for driving a speaker via an external bipolar transistor. The output is configured for NPN and PNP bipolar capability. The output is an alarm tone, modulated by a low frequency. Tone frequencies, modulation frequencies, and on/off times are selectable via the metal mask option.

Alarm Input

A debounced alarm input is provided. Alarm activation is connected either to V_{DD} or V_{SS} by a mask option.

Test Functions

For test purposes, the TEST pad is open. With a high resistance probe ($R \geq 10 \text{ M}\Omega$, $C \geq 20 \text{ pF}$), a test frequency f_{TEST} of 128 Hz can be measured at the ALIN/MTEST pad. Connecting ALIN/MTEST (for at least 32 ms) to the opposite polarity for alarm activation changes the motor period from the selected value to T_{MT} (mask-selectable) while the pulse width remains unaffected. This feature can be used for testing the mechanical parts of the clock.

Absolute Maximum Ratings

Absolute maximum ratings define parameter limits which, if exceeded, may permanently change or damage the device. All inputs and outputs on Atmel's circuits are protected against electrostatic discharges. However, precautions to minimize the build-up of electrostatic charges during handling are recommended. The circuit is protected against supply voltage reversal for typically 5 minutes.
