DESCRIPTION

The ADS8506 is a complete low power, single 5-V • **Single 5-V Analog Supply**
• **Pin-Compatible With ADS7806 and 16-Bit** supply, 12-bit sampling analog-to-digital (A/D)
• **Pin-Compatible With ADS7806 and 16-Bit** converter. It contains a complete 12-bit **ADS7807/8507** capacitor-based, successive approximation register Uses Internal or External 2.5-V Reference (SAR) A/D converter with sample and hold, clock, reference, and data interface. The converter can be **Low Power Dissipation**
10 Configured for a variety of input ranges including ±10
10 Configured for a variety of input ranges including ±10
10 V. 4 V. and 5 V. For most input ranges. the input V, 4 V, and 5 V. For most input ranges, the input • **50-**µ**W Max Power Down Mode** voltage can swing to 25 V or –25 V without damage to the converter.

Full Parallel Interface A SPI compatible serial interface allows data to be synchronized to an internal or external clock. A full • **2's Comp or BTC Output Code** parallel interface with BYTE select is also provided to allow the maximum system design flexibility. The ADS8506 is specified at 40 kHz sampling rate over the industrial -40°C to 85°C temperature range.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of ÆÀ Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet. ²QSPI, SPI are trademarks of Motorola.

SLAS484B–SEPTEMBER 2007–REVISED DECEMBER 2007

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

PACKAGE/ORDERING INFORMATION(1)

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

(1) All voltage values are with respect to network ground terminal.

ELECTRICAL CHARACTERISTICS

At T_A = -40°C to 85°C, f_S = 40 kHz, V_{DIG} = V_{ANA} = 5 V, and using internal reference and fixed resistors, (see [Figure 43](#page-21-0)) unless otherwise specified.

(1) LSB means Least Significant Bit. One LSB for the ± 10 -V input range is 305 μ V.

ELECTRICAL CHARACTERISTICS (continued)

At T_A = -40°C to 85°C, f_S = 40 kHz, V_{DIG} = V_{ANA} = 5 V, and using internal reference and fixed resistors, (see [Figure 43](#page-21-0)) unless otherwise specified.

(2) Typical rms noise at worst case transitions.

(3) As measured with fixed resistors, see [Figure 43.](#page-21-0) Adjustable to zero with external potentiometer.

(4) Full scale error is the worst case of -Full Scale or +Full Scale untrimmed deviation from ideal first and last code transitions, divided by the transition voltage (not divided by the full-scale range) and includes the effect of offset error.

(5) This is the time delay after the ADS8506 is brought out of Power-Down mode until all internal settling occurs and the analog input is acquired to rated accuracy. A Convert command after this delay will yield accurate results.

(6) All specifications in dB are referred to a full-scale input.

(7) Usable bandwidth defined as full-scale input frequency at which Signal-to-(Noise + Distortion) degrades to 60 dB.

 (8) Recovers to specified performance after 2 x FS input overvoltage.

ELECTRICAL CHARACTERISTICS (continued)

At T_A = -40°C to 85°C, f_S = 40 kHz, V_{DIG} = V_{ANA} = 5 V, and using internal reference and fixed resistors, (see [Figure 43](#page-21-0)) unless otherwise specified.

BASIC OPERATION

PARALLEL OUTPUT

[Figure 31](#page-10-0) shows a basic circuit to operate the ADS8506 with a ±10-V input range and parallel output. Taking R/C (pin 22) LOW for a minimum of 40 ns (12 µs max) will initiate a conversion. BUSY (pin 24) will go LOW and stay LOW until the conversion is completed and the output register is updated. If BYTE (pin 21) is LOW, the eight most significant bits (MSBs) will be valid when BUSY rises; if BYTE is HIGH, the four least significant bits (LSBs) will be valid when BUSY rises. Data will be output in binary 2's complement (BTC) format. BUSY going HIGH can be used to latch the data. After the first byte has been read, BYTE can be toggled allowing the remaining byte to be read. All convert commands will be ignored while BUSY is LOW.

The ADS8506 begins tracking the input signal at the end of the conversion. Allowing 25 us between convert commands assures accurate acquisition of a new signal.

The offset and gain are adjusted internally to allow external trimming with a single supply. The external resistors compensate for this adjustment and can be left out if the offset and gain will be corrected in software (refer to the Calibration section).

Figure 31. Basic ±10-V Operation, Both Parallel and Serial Output

SERIAL OUTPUT

[Figure 32](#page-11-0) shows a basic circuit to operate the ADS8506 with a ±10-V input range and serial output. Taking R/C (pin 22) LOW for 40 ns (12 µs max) will initiate a conversion and output valid data from the previous conversion on SDATA (pin 19) synchronized to 12 clock pulses output on DATACLK (pin 18). BUSY (pin 24) will go LOW and stay LOW until the conversion is completed and the serial data has been transmitted. Data will be output in BTC format, MSB first, and will be valid on both the rising and falling edges of the data clock. BUSY going HIGH can be used to latch the data. All convert commands will be ignored while BUSY is LOW.

The ADS8506 begins tracking the input signal at the end of the conversion. Allowing 25 µs between convert commands assures accurate acquisition of a new signal.

The offset and gain are adjusted internally to allow external trimming with a single supply. The external resistors compensate for this adjustment and can be left out if the offset and gain are corrected in software (refer to the Calibration section).

Figure 32. Basic ±10-V Operation With Serial Output

STARTING A CONVERSION

The combination of \overline{CS} (pin 23) and R/ \overline{C} (pin 22) low for a minimum of 40 ns puts the sample-and-hold of the ADS8506 in the hold state and starts conversion *N*. BUSY (pin 24) goes low and stays low until conversion *N* is completed and the internal output register has been updated. All new convert commands during BUSY low are ignored. CS and/or R/C must go high before BUSY goes high, or a new conversion is initiated without sufficient time to acquire a new signal.

The ADS8506 begins tracking the input signal at the end of the conversion. Allowing 25 us between convert commands assures accurate acquisition of a new signal. Refer to Table 2 and [Table 3](#page-12-0) for a summary of CS, R/C, and BUSY states, and [Figure 33,](#page-13-0) [Figure 34](#page-13-0), [Figure 35,](#page-16-0) [Figure 36,](#page-17-0) [Figure 37](#page-17-0), [Figure 38,](#page-18-0) and [Figure 39](#page-18-0) for timing diagrams.

(1) See [Figure 33](#page-13-0) and [Figure 34](#page-13-0) for constraints on data valid from conversion N–1.

CS and R/C are internally ORed and level triggered. It is not a requirement which input goes low first when initiating a conversion. If, however, it is critical that CS or R/C initiates conversion *N*, be sure the less critical input is low at least $t_{s_1/2} \ge 10$ ns prior to the initiating input. If EXT/INT (pin 8) is low when initiating conversion N, serial data from conversion *N–1* is output on SDATA (pin 19) following the start of conversion *N*. See Internal Data Clock in the Reading Data section.

To reduce the number of control pins, \overline{CS} can be tied low using R/\overline{C} to control the read and convert modes. This has no effect when using the internal data clock in the serial output mode. The parallel output and the serial output (only when using an external data clock), however, is affected whenever R/\overline{C} goes high and the external clock is active. Refer to the Reading Data section. In the internal clock mode data is clocked out every convert cycle regardless of the states of \overline{CS} and R/\overline{C} . The conversion result is available as soon as BUSY returns to high therefore, data always represents the conversion previously completed even when it is read during a conversion.

READING DATA

The ADS8506 outputs serial or parallel data in straight binary (SB) or binary 2's complement data output format. If SB/BTC (pin 7) is high, the output is in SB format, and if low, the output is in BTC format. Refer to Table 4 for ideal output codes. The first conversion immediately following a power-up does not produce a valid conversion result.

The parallel output can be read without affecting the internal output registers; however, reading the data through the serial port shifts the internal output registers one bit per data clock pulse. As a result, data can be read on the parallel port prior to reading the same data on the serial port, but data cannot be read through the serial port prior to reading the same data on the parallel port.

(1) See [Figure 37](#page-17-0), [Figure 38,](#page-18-0) and [Figure 39](#page-18-0) for constraints on data valid from conversion *N–1*.

Table 4. Output Codes and Ideal Input Voltages

PARALLEL OUTPUT

To use the parallel output, tie EXT/INT (pin 8) high and DATACLK (pin 18) low. SDATA (pin 19) should be left unconnected. The parallel output is active when R/\overline{C} (pin 22) is high and \overline{CS} (pin 23) is low. Any other combination of CS and R/C 3-states the parallel output. Valid conversion data can be read in two 8-bit bytes on D7-D0 (pins 9-13 and 15-17). When BYTE (pin 21) is low, the 8 most significant bits will be valid with the MSB on D7. When BYTE is high, the 4 least significant bits are valid with the LSB on D4. BYTE can be toggled to read both bytes within one conversion cycle.

Upon initial power up, the parallel output contains indeterminate data.

PARALLEL OUTPUT (After a Conversion)

After conversion *N* is completed and the output registers have been updated, BUSY (pin 24) goes high. Valid data from conversion *N* is available on D7-D0 (pin 9-13 and 15-17). BUSY going high can be used to latch the data. Refer to [Table 5](#page-14-0) and Figure 33 and Figure 34 for timing specifications.

Figure 33. Conversion Timing With Parallel Output (CS and DATACLK Tied Low, EXT/INT Tied High)

Figure 34. CS to Control Conversion and Read Timing With Parallel Outputs

PARALLEL OUTPUT (During a Conversion)

After conversion *N* has been initiated, valid data from conversion *N–1* can be read and is valid up to 12 µs after the start of conversion *N*. Do not attempt to read data beyond 12 µs after the start of conversion *N* until BUSY (pin 24) goes high; this may result in reading invalid data. Refer to Table 5 and [Figure 33](#page-13-0) and [Figure 34](#page-13-0) for timing constraints.

SYMBOL	DESCRIPTION	MIN	TYP	MAX	UNITS
t,	Convert pulse width	0.04		12	μs
t ₂	Data valid delay after R/C low		13.5	15	μs
t_3	BUSY delay from start of conversion			85	ns
t ₄	BUSY Low		13.5	15	μs
t ₅	BUSY delay after end of conversion		90		ns
t_6	Aperture delay		40		ns
t ₇	Conversion time		13.5	15	μs
t_8	Acquisition time		11.5		μs
tg	Bus relinquish time	10		83	ns
t_{10}	BUSY delay after data valid	20	60		ns

t_{12}	Bus access time and BYTE delay		10	83	ns
t_{21}	R/\overline{C} to \overline{CS} setup time	10			ns
$t_7 + t_8$	Throughput time			25	μs

Table 5. Parallel Conversion and Data Timing, $T_A = -40^\circ \text{C}$ **to 85** $^\circ \text{C}$

SERIAL OUTPUT

Data can be clocked out with the internal data clock or an external data clock. When using serial output, be careful with the parallel outputs, D7-D0 (pins 9-13 and 15-17), as these pins come out of Hi-Z state whenever \overline{CS} (pin 23) is low and R/\overline{C} (pin 22) is high. The serial output cannot be 3-stated and is always active. Refer to the Applications Information section for specific serial interfaces. If external clock is used, the TAG input can be used to daisy-chain multiple ADS8506 data pins together.

INTERNAL DATA CLOCK (During a Conversion)

To use the internal data clock, tie EXT/INT (pin 8) low. The combination of R/\overline{C} (pin 22) and CS (pin 23) low initiates conversion *N* and activates the internal data clock (typically 900-kHz clock rate). The ADS8506 outputs 12 bits of valid data, MSB first, from conversion *N–1* on SDATA (pin 19), synchronized to 12 clock pulses output on DATACLK (pin 18). The data is valid on both the rising and falling edges of the internal data clock. The rising edge of BUSY (pin 24) can be used to latch the data. After the 12th clock pulse, DATACLK remains low until the next conversion is initiated, while SDATA returns to the state of the TAG pin input sensed at the start of transmission. Refer to [Table 6](#page-16-0) and [Figure 36](#page-17-0).

EXTERNAL DATA CLOCK

To use an external data clock, tie EXT/INT (pin 8) high. The external data clock is not and cannot be synchronized with the internal conversion clock; care must be taken to avoid corrupting the data. To enable the output mode of the ADS8506, CS (pin 23) must be low and R/C (pin 22) must be high. DATACLK must be high for 20% to 70% of the total data clock period; the clock rate can be between DC and 10 MHz. Serial data from conversion *N* can be output on SDATA (pin 19) after conversion *N* is completed or during conversion *N+1*.

An obvious way to simplify control of the converter is to tie \overline{CS} low and use R/ \overline{C} to initiate conversions.

While this is perfectly acceptable, there is a possible problem when using an external data clock. At an indeterminate point from 12 µs after the start of conversion *N* until BUSY rises, the internal logic shifts the results of conversion *N* into the output register. If CS is low, R/C high, and the external clock is high at this point, data is lost. So, with CS low, either R/C and/or DATACLK must be low during this period to avoid losing valid data.

EXTERNAL DATA CLOCK (After a Conversion)

After conversion *N* is completed and the output registers have been updated, BUSY (pin 24) goes high. With CS low and R/C high, valid data from conversion *N* is output on SDATA (pin 19) synchronized to the external data clock input on DATACLK (pin 18). The MSB is valid on the first falling edge and the second rising edge of the external data clock. The LSB is valid on the 12th falling edge and 13th rising edge of the data clock. TAG (pin 20) inputs a bit of data for every external clock pulse. The first bit input on TAG is valid on SDATA on the 13th falling edge and the 14th rising edge of DATACLK; the second input bit is valid on the 14th falling edge and the 15th rising edge, etc. With a continuous data clock, TAG data is output on SDATA until the internal output registers are updated with the results from the next conversion. Refer to [Table 6](#page-16-0) and [Figure 38](#page-18-0).

EXTERNAL DATA CLOCK (During a Conversion)

After conversion *N* has been initiated, valid data from conversion *N–1* can be read and is valid up to 12 µs after the start of conversion *N*. Do not attempt to clock out data from 12 µs after the start of conversion *N* until BUSY (pin 24) rises; this results in data loss. NOTE: For the best possible performance when using an external data clock, data should not be clocked out during a conversion. The switching noise of the asynchronous data clock can cause digital feedthrough degrading the converter's performance. Refer to [Table 6](#page-16-0) and [Figure 39.](#page-18-0)

CS Set Low, Discontinuous Ext DATACLK

R/C Set Low, Discontinuous Ext DATACLK

CS Set Low, Discontinuous Ext DATACLK

Figure 35. Critical Timing

Figure 37. Basic Conversion Timing - External DATACLK

Figure 39. Read During Conversion (Discontinuous External DATACLK)

TAG FEATURE

The TAG feature allows the data from multiple ADS8506 converters to be read on a single serial line. The converters are cascaded together using the DATA pins as outputs and the TAG pins as inputs as illustrated in [Figure 40](#page-19-0). The DATA pin of the last converter drives the processor's serial data input. Data is then shifted through each converter, synchronous to the externally supplied data clock, onto the serial data line. The internal clock cannot be used for this configuration.

The preferred timing uses the discontinuous, external, data clock during the sampling period. Data must be read during the sampling period because there is not sufficient time to read data from multiple converters during a conversion period without violating the t_{d11} constraint (see the EXTERNAL DATACLOCK section). The sampling period must be sufficiently long to allow all data words to be read before starting a new conversion.

Note, in Figure 40, that a NULL bit separates the data word from each converter. The state of the DATA pin at the end of a READ cycle reflects the state of the TAG pin at the start of the cycle. This is true in all READ modes, including the internal clock mode. For example, when a single converter is used in the internal clock mode the state of the TAG pin determines the state of the DATA pin after all 12 bits have shifted out. When multiple converters are cascaded together this state forms the NULL bit that separates the words. Thus, with the TAG pin of the first converter grounded as shown in Figure 40 the NULL bit becomes a zero between each data word.

EXT/INT tied high, $\overline{\text{CS}}$ of both converter A and B, TAG input of converter A are tied low.

Figure 40. Timing of TAG Feature With Single Conversion (Using External DATACLK)

INPUT RANGES

The ADS8506 offers three input ranges: standard ±10-V and 0-V to 5-V ranges, and a 0-V to 4-V range for complete, single-supply systems. See [Figure 42](#page-20-0) and [Figure 43](#page-21-0) for the necessary circuit connections for implementing each input range and optional offset and gain adjust circuitry. Offset and full-scale error specifications are tested with the fixed resistors, see [Figure 43](#page-21-0) (full-scale error includes offset and gain errors measured at both +FS and -FS). Adjustments for offset and gain are described in the Calibration section of this data sheet.

The offset and gain are adjusted internally to allow external trimming with a single supply. The external resistors compensate for this adjustment and can be left out if the offset and gain are corrected in software (refer to the Calibration section).

The input impedance, summarized in [Table 1,](#page-5-0) results from the combination of the internal resistor network (see the front page of this product data sheet) and the external resistors used for each input range (see [Figure 44\)](#page-22-0). The input resistor divider network provides inherent over-voltage protection to at least \pm 5.5 V for R2_{IN} and \pm 12 V for $R1_{\text{IN}}$.

Analog inputs above or below the expected range yields either positive full-scale or negative full-scale digital outputs, respectively. Wrapping or folding over for analog inputs outside the nominal range does not occur.

.

Figure 41. Typical Driving Circuit (±10 V, No Trim)

CALIBRATION

Hardware Calibration

To calibrate the offset and gain of the ADS8506 in hardware, install the resistors shown in Figure 42. Table 7 lists the hardware trim ranges relative to the input for each input range.

Figure 42. Circuit Diagrams (With Hardware Trim)

Software Calibration

To calibrate the offset and gain in software, no external resistors are required. However, to get the data sheet specifications for offset and gain, the resistors shown in Figure 43 are necessary. See the No Calibration section for more details on the external resistors. Refer to Table 8 for the range of offset and gain errors with and without the external resistors.

Figure 43. Circuit Diagrams (Without Hardware Trim)

Table 8. Range of Offset and Gain Errors With and Without External Resistors

(1) High grade

No Calibration

Figure 43 shows circuit connections. Note that the actual voltage dropped across the external resistors is at least two orders of magnitude lower than the voltage dropped across the internal resistor divider network. This should be considered when choosing the accuracy and drift specifications of the external resistors. In most applications, 1% metal-film resistors are sufficient.

The external resistors, see Figure 43, may not be necessary in some applications. These resistors provide compensation for an internal adjustment of the offset and gain which allows calibration with a single supply. Not using the external resistors results in offset and gain errors in addition to those listed in the electrical characteristics section. Offset refers to the equivalent voltage of the digital output when converting with the input grounded. A positive gain error occurs when the equivalent output voltage of the digital output is larger than the analog input. Refer to Table 8 for nominal ranges of gain and offset errors with and without the external resistors. Refer to [Figure 44](#page-22-0) for typical shifts in the transfer functions which occur when the external resistors are removed.

Figure 44. Typical Transfer Functions With and Without External Resistors

To further analyze the effects of removing any combination of the external resistors, consider Figure 45. The combination of the external and the internal resistors form a voltage divider which reduces the input signal to a 0.3125-V to 2.8125-V input range at the capacitor digital-to-analog converter (CDAC). The internal resistors are laser trimmed to high relative accuracy to meet full-scale specifications. The actual input impedance of the internal resistor network looking into pin 1 or pin 3 however, is only accurate to ±20% due to process variations. This should be taken into account when determining the effects of removing the external resistors.

REFERENCE

The ADS8506 can operate with its internal 2.5-V reference or an external reference. By applying an external reference to pin 5, the internal reference can be bypassed. The reference voltage at REF is buffered internally with the output on CAP (pin 4).

The internal reference has an 8 ppm/°C drift (typical) and accounts for approximately 20% of the full-scale error $(FSE = \pm 0.5\%$ for low grade, $\pm 0.25\%$ for high grade).

The ADS8506 also has an internal buffer for the reference voltage. Figure 46 shows characteristic impedances at the input and output of the buffer with all combinations of powerdown and reference down.

Figure 46. Characteristic Impedances of the Internal Buffer

REF

REF (pin 5) is an input for an external reference or the output for the internal 2.5-V reference. A 2.2-µF tantalum capacitor should be connected as close as possible to the REF pin from ground. This capacitor and the output resistance of REF create a low-pass filter to bandlimit noise on the reference. Using a smaller value capacitor will introduce more noise to the reference, degrading the SNR and SINAD. The REF pin should not be used to drive external AC or DC loads, as shown in Figure 46.

The range for the external reference is 2.3 V to 2.7 V and determines the actual LSB size. Increasing the reference voltage increases the full-scale range and the LSB size of the converter which can improve the SNR.

CAP

CAP (pin 4) is the output of the internal reference buffer. A 2.2-µF tantalum capacitor should be placed as close as possible to the CAP pin from ground to provide optimum switching currents for the CDAC throughout the conversions cycle. This capacitor also provides compensation for the output of the buffer. Using a capacitor any smaller than 1 μ F can cause the output buffer to oscillate and may not have sufficient charge for the CDAC. Capacitor values larger than 2.2 µF have little affect on improving performance. ESR is the total equivalent series resistance of the compensation capacitor (CAP pin). See Figure 46 and [Figure 47](#page-24-0).

Figure 47. Power-Down to Power-Up Time vs Capacitor Value on CAP

The output of the buffer is capable of driving up to 1 mA of current to a DC load. Using an external buffer allows the internal reference to be used for larger DC loads and AC loads. Do not attempt to directly drive an AC load with the output voltage on CAP. This causes performance degradation of the converter.

REFERENCE AND POWER-DOWN

The ADS8506 has analog power-down and reference power down capabilities via PWRD (pin 25) and REFD (pin 26), respectively. PWRD and REFD high powers down all analog circuitry maintaining data from the previous conversion in the internal registers, provided that the data has not already been shifted out through the serial port. Typical power consumption in this mode is 50 µW. Power recovery is typically 1 ms, using a 2.2-µF capacitor connected to CAP. Figure 47 shows power-down to power-up recovery time relative to the capacitor value on CAP. With $+5$ V applied to V_{DIG}, the digital circuitry of the ADS8506 remains active at all times, regardless of PWRD and REFD states.

PWRD

PWRD high powers down all of the analog circuitry except for the reference. Data from the previous conversion is maintained in the internal registers and can still be read. With PWRD high, a convert command yields meaningless data.

REFD

REFD high powers down the internal 2.5-V reference. All other analog circuitry, including the reference buffer, is active. REFD should be high when using an external reference to minimize power consumption and the loading effects on the external reference. See [Figure 46](#page-23-0) for the characteristic impedance of the reference buffer's input for both REFD high and low. The internal reference consumes approximately 5 mW.

LAYOUT

POWER

For optimum performance, tie the analog and digital power pins to the same +5-V power supply and tie the analog and digital grounds together. As noted in the electrical characteristics, the ADS8506 uses 90% of its power for the analog circuitry. The ADS8506 should be considered as an analog component.

The $+5-V$ power for the A/D converter should be separate from the $+5 V$ used for the system's digital logic. Connecting V_{DIG} (pin 28) directly to a digital supply can reduce converter performance due to switching noise

from the digital logic. For best performance, the +5-V supply can be produced from whatever analog supply is used for the rest of the analog signal conditioning. If $+12$ -V or $+15$ -V supplies are present, a simple $+5$ -V regulator can be used. Although it is not suggested, if the digital supply must be used to power the converter, be sure to properly filter the supply. Either using a filtered digital supply or a regulated analog supply, both V_{DIG} and V_{ANA} should be tied to the same $+5-V$ source.

GROUNDING

Three ground pins are present on the ADS8506. DGND is the digital supply ground. AGND2 is the analog supply ground. AGND1 is the ground to which all analog signals internal to the A/D converter are referenced. AGND1 is more susceptible to current induced voltage drops and must have the path of least resistance back to the power supply.

All the ground pins of the A/D converter should be tied to an analog ground plane, separated from the system's digital logic ground, to achieve optimum performance. Both analog and digital ground planes should be tied to the *system* ground as near to the power supplies as possible. This helps to prevent dynamic digital ground currents from modulating the analog ground through a common impedance to power ground.

SIGNAL CONDITIONING

The FET switches used for the sample hold on many CMOS A/D converters release a significant amount of charge injection which can cause the driving op amp to oscillate. The amount of charge injection due to the sampling FET switch on the ADS8506 is approximately 5% to 10% of the amount on similar A/D converters with the charge redistribution digital-to-analog converter (DAC) CDAC architecture. There is also a resistive front end which attenuates any charge which is released. The end result is a minimal requirement for the drive capability on the signal conditioning preceding the A/D converter. Any op amp sufficient for the signal in an application will be sufficient to drive the ADS8506.

The resistive front end of the ADS8506 also provides a specified ±25-V overvoltage protection. In most cases, this eliminates the need for external over-voltage protection circuitry.

INTERMEDIATE LATCHES

The ADS8506 does have 3-state outputs for the parallel port, but intermediate latches should be used if the bus is active during conversions. If the bus is not active during conversion, the 3-state outputs can be used to isolate the A/D converter from other peripherals on the same bus.

Intermediate latches are beneficial on any monolithic A/D converter. The ADS8506 has an internal LSB size of 38 μ V. Transients from fast switching signals on the parallel port, even when the A/D converter is 3-stated, can be coupled through the substrate to the analog circuitry causing degradation of converter performance.

APPLICATION INFORMATION

AVERAGING

The noise of the converter can be compensated by averaging the digital codes. By averaging conversion results, transition noise is reduced by a factor of 1/√Hz where n is the number of averages. For example, averaging four conversion results reduces the TN by to 0.4 LSBs. Averaging should only be used for input signals with frequencies near DC.

For AC signals, a digital filter can be used to low-pass filter and decimate the output codes. This works in a similar manner to averaging: for every decimation by 2, the signal-to-noise ratio improves 3 dB.

QSPI™ INTERFACE

Figure 48 shows a simple interface between the ADS8506 and any QSPI equipped microcontroller. This interface assumes that the convert pulse does not originate from the microcontroller and that the ADS8506 is the only serial peripheral.

CPHA = 1 (Data Valid on Falling Edge) QSPI Port is in Slave Mode The ADC is the SPI master

Figure 48. QSPI Interface to the ADS8506

Before enabling the QSPI interface, the microcontroller must be configured to monitor the slave select line. When a transition from high to low occurs on slave select (\overline{SS}) from \overline{BUSY} (indicating the end of the current conversion), the port can be enabled. If this is not done, the microcontroller and the A/D converter may be *out-of-sync*.

SPI™ INTERFACE

The SPI interface is generally only capable of 8-bit data transfers. For some microcontrollers with SPI interfaces, it might be possible to receive data in a similar manner as shown for the QSPI interface in Figure 48. The microcontroller needs to fetch the 8 most significant bits before the contents are overwritten by the least significant bits.

Revision History

Changes from Revision A (OCTOBER 2007) to Revision B ... Page

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PACKAGE MATERIALS INFORMATION

*All dimensions are nominal

www.ti.com 5-Jan-2022

TUBE

*All dimensions are nominal

 DW (R-PDSO-G28)

PLASTIC SMALL OUTLINE

NOTES:

A. All linear dimensions are in inches (millimeters). Dimensioning and tolerancing per ASME Y14.5M-1994.

B. This drawing is subject to change without notice.

C. Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15).

D. Falls within JEDEC MS-013 variation AE.

LAND PATTERN DATA

NOTES:

All linear dimensions are in millimeters. A.

- B. This drawing is subject to change without notice.
- C. Refer to IPC7351 for alternate board design.
- D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525
- E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](https://www.ti.com/legal/termsofsale.html) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
