**DATASHEET** 

## **General Description**

The ICS840N011I is an LVCMOS/LVTTL clock synthesizer designed for Fibre Channel applications. The device generates a 106.25MHz clock signal from a 26.5625MHz crystal or a 100MHz clock signal from a 25MHz crystal with excellent phase jitter performance. The device uses IDT's fourth generation FemtoClock<sup>®</sup> NG technology for an optimum of high clock frequency, low phase noise performance and low power consumption and high power supply noise rejection. The device supports 2.5V or 3.3V voltage supply and is packaged in a small, lead-free (RoHS 6) 8-lead TSSOP package. The extended temperature range supports wireless infrastructure, telecommunication and networking end equipment requirements.

#### **Frequency Table**

| f <sub>XTAL</sub> (MHz) | Output Frequency (MHz) |  |  |
|-------------------------|------------------------|--|--|
| 25                      | 100                    |  |  |
| 26.5625                 | 106.25                 |  |  |
| 30.72                   | 122.88                 |  |  |
| 31.25                   | 125                    |  |  |

#### **Function Table**

| Input       |  |
|-------------|--|
| OE          | Output Enable                                |
| 0           | Output Q is disabled in high-impedance state |
| 1 (default) | Output Q is enabled.                         |

NOTE: OE is an asynchronous control.

### **Features**

- Fourth generation FemtoClock<sup>®</sup> NG technology
- 106.25MHz output clock synthesized from a 26.5625MHz fundamental mode crystal
- One 2.5V or 3.3V LVCMOS/LVTTL clock output
- Crystal interface designed for a 12pF parallel resonant crystal
- RMS phase jitter @ 100MHz, using a 25MHz crystal (637kHz - 10MHz): 0.185ps (maximum)
- LVCMOS/LVTTL interface level for the output enable input
- Full 2.5V or 3.3V supply voltage
- · Lead-free (RoHS 6) packaging
- -40°C to 85°C ambient operating temperature

## **Absolute Maximum Ratings**

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics or AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

| Item  | Rating                                      |
|---|---|
| Supply Voltage, V <sub>DD</sub>             | 3.63V                                       |

### **Applications Information**

### Overdriving the XTAL Interface

The XTAL\_IN input can be overdriven by an LVCMOS driver or by one side of a differential driver through an AC coupling capacitor. The XTAL\_OUT pin can be left floating. The amplitude of the input signal should be between 500mV and 1.8V and the slew rate should not be less than 0.2V/ns. For 3.3V LVCMOS inputs, the amplitude must be reduced from full swing to at least half the swing in order to prevent signal interference with the power rail and to reduce internal noise. Figure 1A shows an example of the interface diagram for a high speed 3.3V LVCMOS driver. This configuration requires that the sum of the output impedance of the driver (Ro) and the series resistance (Rs) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This

can be done in one of two ways. First, R1 and R2 in parallel should equal the transmission line impedance. For most  $50\Omega$  applications, R1 and R2 can be  $100\Omega$ . This can also be accomplished by removing R1 and changing R2 to  $50\Omega$ . The values of the resistors can be increased to reduce the loading for a slower and weaker LVCMOS driver. Figure 1B shows an example of the interface diagram for an LVPECL driver. This is a standard LVPECL termination with one side of the driver feeding the XTAL\_IN input. It is recommended that all components in the schematics be placed in the layout. Though some components might not be used, they can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a quartz crystal as the input.

Figure 1A. General Diagram for LVCMOS Driver to XTAL Input Interface

Figure 1B. General Diagram for LVPECL Driver to XTAL Input Interface

### Schematic Layout

Figure 2 shows an example ICS840N011I application schematic in which the device is operated at  $V_{DD} = V_{DDA} = +3.3V$ . The schematic example focuses on functional connections and is intended as an example only and may not represent the exact user configuration. Refer to the pin description and functional tables in the datasheet to ensure the logic control inputs are properly set. For example OE can be configured from an FPGA instead of set with pull up and pull down resistors as shown.

As with any high speed analog circuitry, the power supply pins are vulnerable to random noise, so to achieve optimum jitter performance isolation of the  $V_{DD}$  pin from power supply is required. In order to achieve the best possible filtering, it is recommended that the placement of the filter components be on the device side of the PCB as close to the power pins as possible. If space is limited, the  $0.1\mu F$ 

capacitor on the  $V_{DD}$  pin must be placed on the device side with direct return to the ground plane though vias. The remaining filter components can be on the opposite side of the PCB.

Power supply filter component recommendations are a general guideline to be used for reducing external noise from coupling into the devices. The filter performance is designed for a wide range of noise frequencies. This low-pass filter starts to attenuate noise at approximately 10kHz. If a specific frequency noise component is known, such as switching power supplies frequencies, it is recommended that component values be adjusted and if required, additional filtering be added. Additionally, good general design practices for power plane voltage stability suggests adding bulk capacitance in the local area of all devices.

Figure 2. ICS840N011I Application Schematic

### **Power Considerations**

This section provides information on power dissipation and junction temperature for the ICS840N011I. Equations and example calculations are also provided.

#### 1. Power Dissipation.

The total power dissipation for the ICS840N011I is the sum of the core power plus the analog power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{DD} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

- Power (core)<sub>MAX</sub> =  $V_{DD\ MAX}$  \* ( $I_{DD} + I_{DDA}$ ) = 3.465V \*(67mA + 18mA) = **294.53mW**
- Output Impedance  $R_{OUT}$  Current due to Loading  $50\Omega$  to  $V_{DD}/2$  Output Current  $I_{OUT} = V_{DD~MAX} / [2 * (50\Omega + R_{OUT})] = 3.465 V / [2 * (50\Omega + 15\Omega)] = 26.7mA$
- Power Dissipation on the R<sub>OUT</sub> per LVCMOS output Power (R<sub>OUT</sub>) = R<sub>OUT</sub> \* (I<sub>OUT</sub>)<sup>2</sup> = 15 $\Omega$  \* (26.7mA)<sup>2</sup> = **10.7mW**
- Total Power (R<sub>OUT</sub>) = 10.7mW \* 1 = 10.7mW

#### **Dynamic Power Dissipation at 125MHz**

```
Power (125MHz) = C_{PD} * Frequency * (V_{DD})^2 = 11pF * 125MHz * (3.465V)^2 = 16.51mW Total Power (125MHz) = 16.51mW * 1 = 16.51mW
```

#### **Total Power Dissipation**

- Total Power
  - = Power (core)<sub>MAX</sub> + Power ( $R_{OUT}$ ) + Power (125MHz)
  - = 294.53mW + 10.7mW + 16.51mW
  - = 321.74mW

#### 2. Junction Temperature.

Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature, Tj, to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for Tj is as follows: Tj =  $\theta_{JA}$  \* Pd\_total + T<sub>A</sub>

Tj = Junction Temperature

 $\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

Pd\_total = Total Device Power Dissipation (example calculation is in section 1 above)

T<sub>A</sub> = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance q<sub>JA</sub> must be used. Assuming no air flow and a multi-layer board, the appropriate value is 117°C/W per Table 6 below.

Therefore, Tj for an ambient temperature of 85°C with all outputs switching is:

 $85^{\circ}\text{C} + 0.322\text{W} * 117^{\circ}\text{C/W} = 122.7^{\circ}\text{C}$ . This is below the limit of  $125^{\circ}\text{C}$ .

This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

#### Table 6. Thermal Resistance $\theta_{JA}$ for 8 Lead TSSOP, Forced Convection

| $\theta_{JA}$ by Velocity                   |         |  |  |  |
|---|---------|--|--|--|
| Meters per Second                           | 0       |  |  |  |
| Multi-Layer PCB, JEDEC Standard Test Boards | 117°C/W |  |  |  |

### **Transistor Count**

The transistor count for ICS840N011I is: 24,811

# **Package Outline and Package Dimensions**

Package Outline - G Suffix for 8 Lead TSSOP

**Table 8. Package Dimensions** 

| All Dimensions in Millimeters |                        |       |  |  |  |
|-------------------------------|------------------------|-------|--|--|--|
| Symbol                        | Symbol Minimum Maximum |       |  |  |  |
| N                             | 8                      | 3     |  |  |  |
| Α                             |                        | 1.20  |  |  |  |
| A1                            | 0.5                    | 0.15  |  |  |  |
| A2                            | 0.80                   | 1.05  |  |  |  |
| b                             | 0.19                   | 0.30  |  |  |  |
| С                             | 0.09                   | 0.20  |  |  |  |
| D                             | 2.90 3.10              |       |  |  |  |
| Е                             | 6.40                   | Basic |  |  |  |
| E1                            | 4.30 4.50              |       |  |  |  |
| е                             | 0.65                   | Basic |  |  |  |
| L                             | 0.45 0.75              |       |  |  |  |
| α                             | 0° 8°                  |       |  |  |  |
| aaa                           |                        | 0.10  |  |  |  |
