GENERAL DESCRIPTION

The ADuM1200-EP[1] is a dual-channel, digital isolator based on the Analog Devices, Inc., *i*Coupler® technology. Combining high speed CMOS and monolithic transformer technologies, this isolation component provides outstanding performance characteristics superior to alternatives, such as optocouplers.

By avoiding the use of LEDs and photodiodes, *i*Coupler devices remove the design difficulties commonly associated with optocouplers. The typical optocoupler concerns regarding uncertain current transfer ratios, nonlinear transfer functions, and temperature and lifetime effects are eliminated with the simple *i*Coupler digital interfaces and stable performance characteristics. The need for external drivers and other discrete components is eliminated with these *i*Coupler products. Furthermore, *i*Coupler devices consume one-tenth to one-sixth the power of optocouplers at comparable signal data rates.

The ADuM1200-EP isolator provides two independent isolation channels with a supply voltage on either side ranging from 3.0 V to 5.5 V. In addition, the ADuM1200-EP provides low pulse width distortion and tight channel-to-channel matching. Unlike other optocoupler alternatives, the ADuM1200-EP isolator has a patented refresh feature that ensures dc correctness in the absence of input logic transitions and during power-up/ power-down conditions.

Full details about this enhanced product are available in the ADuM1200/ADuM1201 data sheet, which should be consulted in conjunction with this data sheet.

Parameter	Rating
Storage Temperature (T_{ST})	−55°C to +150°C
Ambient Operating Temperature (T_A)	−55°C to +125°C
Supply Voltages (V_{DD1}, V_{DD2})[1]	−0.5 V to +7.0 V
Input Voltages (V_{IA}, V_{IB})[1, 2]	−0.5 V to V_{DDI} + 0.5 V
Output Voltages (V_{OA}, V_{OB})[1, 2]	−0.5 V to V_{DDO} + 0.5 V
Average Output Current per Pin (I_O)[3]	−11 mA to +11 mA
Common-Mode Transients (CM_L, CM_H)[4]	−100 kV/µs to +100 kV/µs

[1] All voltages are relative to their respective ground.
[2] V_{DDI} and V_{DDO} refer to the supply voltages on the input and output sides of a given channel, respectively.
[3] See Figure 2 for maximum rated current values for various temperatures.
[4] Refers to common-mode transients across the insulation barrier. Common-mode transients exceeding the absolute maximum ratings can cause latch-up or permanent damage.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Table 10. Maximum Continuous Working Voltage[1]

Parameter	Max	Unit	Constraint

Bipolar Waveform	565	V_{PEAK}	50-year minimum lifetime
Unipolar Waveform	1131	V_{PEAK}	50-year minimum lifetime
DC Voltage	1131	V_{PEAK}	50-year minimum lifetime

[1] Refers to continuous voltage magnitude imposed across the isolation barrier.
