

MAX3372E–MAX3379E/ ±15kV ESD-Protected, 1µA, 16Mbps, Dual/Quad MAX3390E–MAX3393E Low-Voltage Level Translators in UCSP

General Description

The MAX3372E–MAX3379E and MAX3390E–MAX3393E ±15kV ESD-protected level translators provide the level shifting necessary to allow data transfer in a multivoltage system. Externally applied voltages, V_{CC} and V_L , set the logic levels on either side of the device. A low-voltage logic signal present on the V_L side of the device appears as a high-voltage logic signal on the V_{CC} side of the device, and vice-versa. The MAX3374E/MAX3375E/MAX3376E/MAX3379E and MAX3390E–MAX3393E unidirectional level translators level shift data in one direction ($V_L \rightarrow V_{CC}$ or $V_{CC} \rightarrow V_L$) on any single data line. The MAX3372E/MAX3373E and MAX3377E/MAX3378E bidirectional level translators utilize a transmission-gate-based design (Figure 2) to allow data translation in either direction ($V_L \leftrightarrow V_{CC}$) on any single data line. The MAX3372E–MAX3379E and MAX3390E–MAX3393E accept V_L from +1.2V to +5.5V and V_{CC} from +1.65V to +5.5V, making them ideal for data transfer between low-voltage ASICs/PLDs and higher voltage systems.

All devices in the MAX3372E–MAX3379E, MAX3390E–MAX3393E family feature a three-state output mode that reduces supply current to less than 1µA, thermal shortcircuit protection, and ±15kV ESD protection on the V_{CC} side for greater protection in applications that route signals externally. The MAX3372E/MAX3377E operate at a guaranteed data rate of 230kbps. Slew-rate limiting reduces EMI emissions in all 230kbps devices. The MAX3373E–MAX3376E/MAX3378E/MAX3379E and MAX3390E–MAX3393E operate at a guaranteed data rate of 8Mbps over the entire specified operating voltage range. Within specific voltage domains, higher data rates are possible. (See the *Timing Characteristics* table.)

The MAX3372E–MAX3376E are dual level shifters available in 3 x 3 UCSP™, 8-pin TDFN, and 8-pin SOT23-8 packages. The MAX3377E/MAX3378E/MAX3379E and MAX3390E–MAX3393E are quad level shifters available in 3 x 4 UCSP, 14-pin TDFN, and 14-pin TSSOP packages.

Applications

- SPI, MICROWIRE, and I²C Level Translation
- Low-Voltage ASIC Level Translation
- Smart Card Readers
- Cell-Phone Cradles
- Portable POS Systems
- Portable Communication Devices
- Low-Cost Serial Interfaces
- Cell Phones
- GPS
- Telecommunications Equipment

Features

- Logic-Level Translators Simplify Design by Enabling Data Transfer Between Lower and Higher Voltage Systems
- Operation Down to +1.2V on V_L
- Guaranteed Data Rate Options
 - 230kbps
 - 8Mbps ($+1.2V \leq V_L \leq V_{CC} \leq +5.5V$)
 - 10Mbps ($+1.2V \leq V_L \leq V_{CC} \leq +3.3V$)
 - 16Mbps ($+1.8V \leq V_L \leq V_{CC} \leq +2.5V$ and $+2.5V \leq V_L \leq V_{CC} \leq +3.3V$)
- Bidirectional Level Translation (MAX3372E/MAX3373E and MAX3377E/MAX3378E)
- Low Power Consumption Reduces Thermal Dissipation
- Quiescent Current (130µA typ)
- 1µA Supply Current in Three-State Output Mode
- Slew-Rate Limiting Lowers EMI
- Protection Features Increase System Reliability
- ±15kV ESD Protection on I/O V_{CC} Lines
- Thermal Short-Circuit Protection

Ordering Information continued at end of data sheet.
Selector Guide appears at end of data sheet.

Absolute Maximum Ratings

(All voltages referenced to GND.)

| | |
|---|-----------------------------------|
| V _{CC} | -0.3V to +6V |
| I/O V _{CC_} | -0.3V to (V _{CC} + 0.3V) |
| I/O V _L | -0.3V to (V _L + 0.3V) |
| THREE-STATE..... | -0.3V to (V _L + 0.3V) |
| Short-Circuit Duration I/O V _L , I/O V _{CC} to GND..... | Continuous |
| Short-Circuit Duration I/O V _L or I/O V _{CC} to GND Driven from 40mA Source (except MAX3372E and MAX3377E)..... | Continuous |
| Continuous Power Dissipation (T _A = +70°C) 8-Pin SOT23 (derate 5.6mW/°C above +70°C)..... | 444.4mW |

| | |
|---|-----------------|
| 8-Pin TDFN (derate 18.5mW/°C above +70°C)..... | 1482mW |
| 3 x 3 UCSP (derate 4.7mW/°C above +70°C)..... | 379mW |
| 3 x 4 UCSP (derate 6.5mW/°C above +70°C)..... | 520mW |
| 14-Pin TSSOP (derate 9.1mW/°C above +70°C)..... | 727mW |
| 14-Pin TDFN (derate 18.5mW/°C above +70°C)..... | 1482mW |
| Operating Temperature Range..... | -40°C to +85°C |
| Storage Temperature Range..... | -65°C to +150°C |
| Lead Temperature (soldering, 10s)..... | +300°C |
| Soldering Temperature (reflow)..... | +260°C |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Electrical Characteristics

(V_{CC} = +1.65V to +5.5V, V_L = +1.2V to (V_{CC} + 0.3V), GND = 0, I/O V_{L_} and I/O V_{CC_} unconnected, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at V_{CC} = +3.3V, V_L = +1.8V, T_A = +25°C.) (Notes 1, 2)

| PARAMETER | SYMBOL | CONDITIONS | MIN | TYP | MAX | UNITS |
|---|------------------------------|--|----------------------|------|------|-------|
| POWER SUPPLIES | | | | | | |
| V _L Supply Range | V _L | | 1.2 | | 5.5 | V |
| V _{CC} Supply Range | V _{CC} | | 1.65 | | 5.50 | V |
| Supply Current from V _{CC} | I _{QVCC} | | | 130 | 300 | µA |
| Supply Current from V _L | I _{QVL} | | | 16 | 100 | µA |

Note 1: All units are 100% production tested at $T_A = +25^\circ C$. Limits over the operating temperature range are guaranteed by design and not production tested.

Note 2: For normal operation, ensure $V_L < (V_{CC} + 0.3V)$. During power-up, $V_L > (V_{CC} + 0.3V)$ will not damage the device.

Note 3: To ensure maximum ESD protection, place a 1µF capacitor between V_{CC} and GND. See Applications Circuits.

Note 4: 10% to 90%

Note 5: 90% to 10%

MAX3390E–MAX3393E**

**±15kV ESD-Protected, 1µA, 16Mbps, Dual/Quad
Low-Voltage Level Translators in UCSF**

Detailed Description

The MAX3372E–MAX3379E and MAX3390E–MAX3393E ESD-protected level translators provide the level shifting necessary to allow data transfer in a multivoltage system. Externally applied voltages, V_{CC} and V_L , set the logic levels on either side of the device. A low-voltage logic signal present on the V_L side of the device appears as a high-voltage logic signal on the V_{CC} side of the device, and vice-versa. The MAX3374E/MAX3375E/MAX3376E/MAX3379E and MAX3390E–MAX3393E unidirectional level translators level shift data in one direction ($V_L \rightarrow V_{CC}$ or $V_{CC} \rightarrow V_L$) on any single data line. The MAX3372E/MAX3373E and MAX3377E/MAX3378E bidirectional level translators utilize a transmission-gatebased design (see Figure 2) to allow data translation in either direction ($V_L \leftrightarrow V_{CC}$) on any single data line. The MAX3372E–MAX3379E and MAX3390E–MAX3393E accept V_L from

+1.2V to +5.5V and V_{CC} from +1.65V to +5.5V, making them ideal for data transfer between low-voltage ASICs/PLDs and higher voltage systems.

All devices in the MAX3372E–MAX3379E, MAX3390E–MAX3393E family feature a three-state output mode that reduces supply current to less than 1µA, thermal shortcircuit protection, and ±15kV ESD protection on the V_{CC} side for greater protection in applications that route signals externally. The MAX3372E/MAX3377E operate at a guaranteed data rate of 230kbps. Slew-rate limiting reduces EMI emissions in all 230kbps devices. The MAX3373E–MAX3376E/MAX3378E/MAX3379E and MAX3390E–MAX3393E operate at a guaranteed data rate of 8Mbps over the entire specified operating voltage range. Within specific voltage domains, higher data rates are possible. (See the *Timing Characteristics* table.)

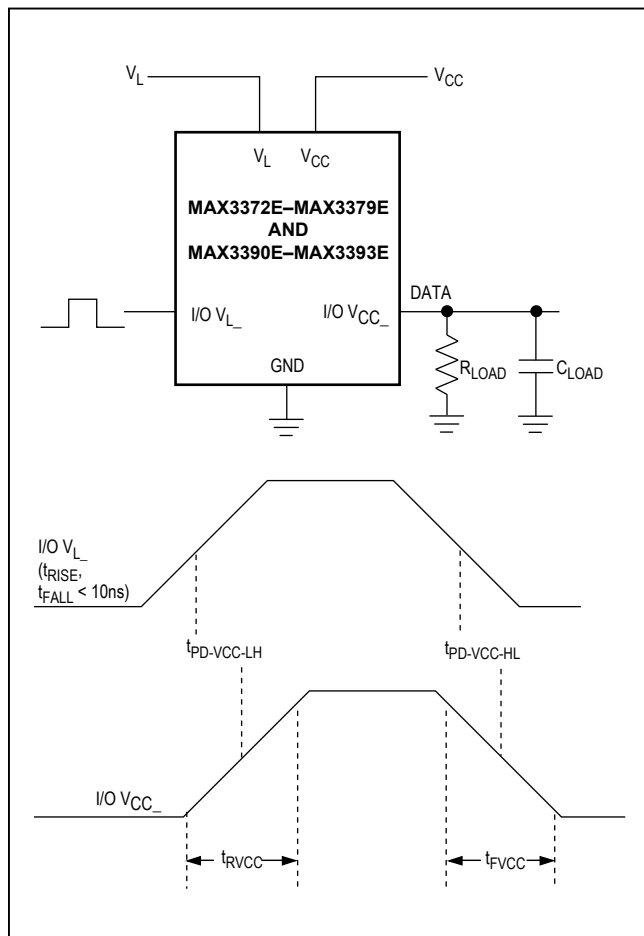

Figure 1a. Rail-to-Rail Driving I/O V_L

Figure 1b. Rail-to-Rail Driving I/O V_{CC}

Level Translation

For proper operation ensure that $+1.65V \leq V_{CC} \leq +5.5V$, $+1.2V \leq V_L \leq +5.5V$, and $V_L \leq (V_{CC} + 0.3V)$. During power-up sequencing, $V_L \geq (V_{CC} + 0.3V)$ will not damage the device. During power-supply sequencing, when V_{CC} is floating and V_L is powering up, a current may be sourced, yet the device will not latch up. The speed-up circuitry limits the maximum data rate for devices in the MAX3372E–MAX3379E, MAX3390E–MAX3393E family to 16Mbps. The maximum data rate also depends heavily on the load capacitance (see the *Typical Operating Characteristics*), output impedance of the driver, and the operational voltage range (see the *Timing Characteristics* table).

Speed-Up Circuitry

The MAX3373E–MAX3376E/MAX3378E/MAX3379E and MAX3390E–MAX3393E feature a one-shot generator that decreases the rise time of the output. When triggered, MOSFETs PU1 and PU2 turn on for a short time

to pull up I/O V_L and I/O V_{CC} to their respective supplies (see Figure 2b). This greatly reduces the rise time and propagation delay for the low-to-high transition. The scope photo of Rail-to-Rail Driving for 8Mbps Operation in the *Typical Operating Characteristics* shows the speed-up circuitry in operation.

Rise-Time Accelerators

The MAX3373E–MAX3376E/MAX3378E/MAX3379E and the MAX3390E–MAX3393E have internal rise-time accelerators allowing operation up to 16Mbps. The rise-time accelerators are present on both sides of the device and act to speed up the rise time of the input and output of the device, regardless of the direction of the data. The triggering mechanism for these accelerators is both level and edge sensitive. To prevent false triggering of the rise-time accelerators, signal fall times of less than 20ns/V are recommended for both the inputs and outputs of the device. Under less noisy conditions, longer signal fall times may be acceptable.

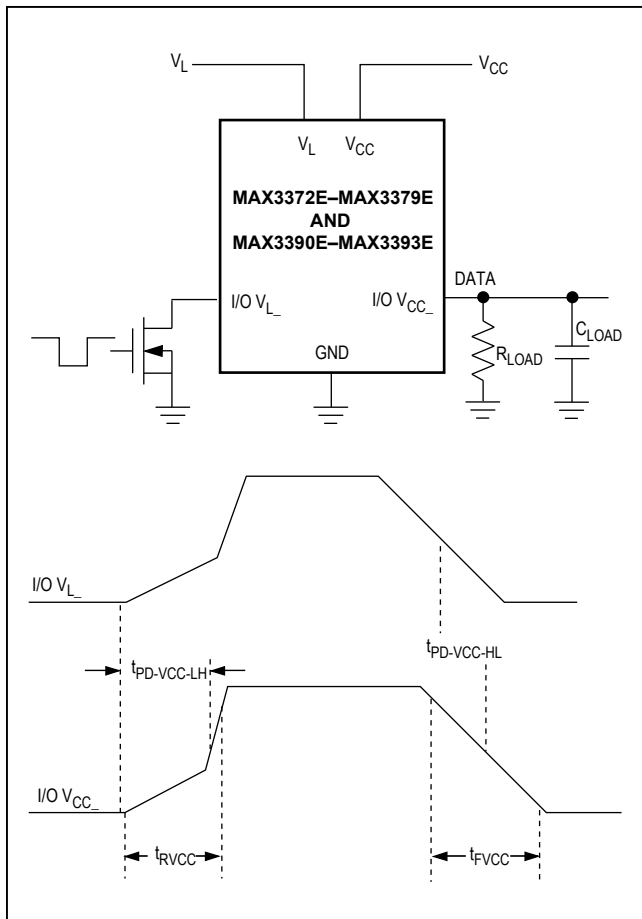

Figure 1c. Open-Drain Driving I/O V_{CC}

Figure 1d. Open-Drain Driving I/O V_L

Three-State Output Mode

Pull $\overline{\text{THREE-STATE}}$ low to place the MAX3372E–MAX3379E and MAX3390E–MAX3393E in three-state output mode. Connect $\overline{\text{THREE-STATE}}$ to V_L (logic-high) for normal operation. Activating the three-state output mode disconnects the internal 10kΩ pullup resistors on the I/O V_{CC} and I/O V_L lines. This forces the I/O lines to a high-impedance state, and decreases the supply current to less than 1µA. The high-impedance I/O lines in three-state output mode allow for use in a multidrop network. When in three-state output mode, do not allow the voltage

at I/O V_L to exceed $(V_L + 0.3V)$, or the voltage at I/O V_{CC} to exceed $(V_{CC} + 0.3V)$.

Thermal Short-Circuit Protection

Thermal overload detection protects the MAX3372E–MAX3379E and MAX3390E–MAX3393E from short-circuit fault conditions. In the event of a short-circuit fault, when the junction temperature (T_J) reaches +152°C, a thermal sensor signals the three-state output mode logic to force the device into three-state output mode. When T_J has cooled to +142°C, normal operation resumes.

Figure 2a. Functional Diagram, MAX3372E/MAX3377E (1 I/O line)

Figure 2b. Functional Diagram, MAX3373E/MAX3378E (1 I/O line)

±15kV ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The I/O V_{CC} lines have extra protection against static electricity. Maxim’s engineers have developed state-of-the-art structures to protect these pins against ESD of ±15kV without damage. The ESD structures withstand high ESD in all states: normal operation, three-state output mode, and powered down. After an ESD event, Maxim’s E versions keep working without latchup, whereas competing products can latch and must be powered down to remove latchup.

ESD protection can be tested in various ways. The I/O V_{CC} lines of this product family are characterized for protection to the following limits:

- 1) ±15kV using the Human Body Model
- 2) ±8kV using the Contact Discharge method specified in IEC 1000-4-2
- 3) ±10kV using IEC 1000-4-2’s Air-Gap Discharge method

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

Human Body Model

Figure 3a shows the Human Body Model and Figure 3b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

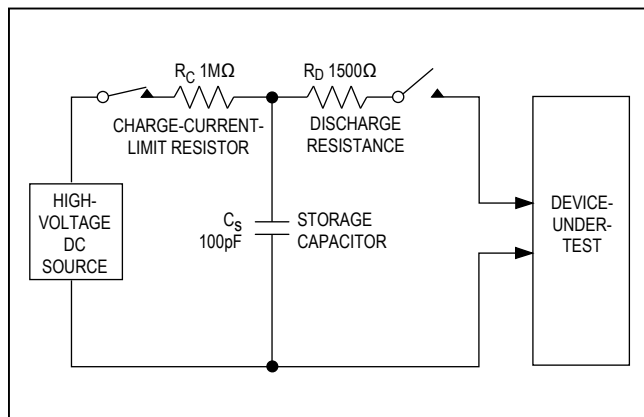

Figure 3a. Human Body ESD Test Model

IEC 1000-4-2

The IEC 1000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to integrated circuits. The MAX3372E–MAX3379E and MAX3390E–MAX3393E help to design equipment that meets Level 3 of IEC 1000-4-2, without the need for additional ESD-protection components.

The major difference between tests done using the Human Body Model and IEC 1000-4-2 is higher peak current in IEC 1000-4-2, because series resistance is lower in the IEC 1000-4-2 model. Hence, the ESD with-stand voltage measured to IEC 1000-4-2 is generally lower than that measured using the Human Body Model. Figure 4a shows the IEC 1000-4-2 model, and Figure 4b shows the current waveform for the ±8kV, IEC 1000-4-2, Level 4, ESD contact-discharge test.

The air-gap test involves approaching the device with a charged probe. The contact-discharge method connects the probe to the device before the probe is energized.

Machine Model

The Machine Model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. Its objective is to emulate the stress caused by contact that occurs with handling and assembly during manufacturing. Of course, all pins require this protection during manufacturing, not just inputs and outputs. Therefore, after PCB assembly, the Machine Model is less relevant to I/O ports.

Figure 3b. Human Body Current Waveform

Figure 4a. IEC 1000-4-2 ESD Test Model

Figure 4b. IEC 1000-4-2 ESD Generator Current Waveform

Applications Information

Power-Supply Decoupling

To reduce ripple and the chance of transmitting incorrect data, bypass V_L and V_{CC} to ground with a 0.1μF capacitor. See the *Typical Operating Circuit*. To ensure full ±15kV ESD protection, bypass V_{CC} to ground with a 1μF capacitor. Place all capacitors as close to the power-supply inputs as possible.

I²C Level Translation

The MAX3373E–MAX3376E, MAX3378E/MAX3379E and MAX3390E–MAX3393E level-shift the data present on the I/O lines between +1.2V and +5.5V, making them

ideal for level translation between a low-voltage ASIC and an I²C device. A typical application involves interfacing a low-voltage microprocessor to a 3V or 5V D/A converter, such as the MAX517.

Push-Pull vs. Open-Drive Driving

All devices in the MAX3372E–MAX3379E and MAX3390E–MAX3393E family may be driven in a pushpull configuration. The MAX3373E–MAX3376E/MAX3378E/MAX3379E and MAX3390E–MAX3393E include internal 10kΩ resistors that pull up I/O V_L and I/O V_{CC} to their respective power supplies, allowing operation of the I/O lines with open-drain devices. See the *Timing Characteristics* table for maximum data rates when using open-drain drivers.
