## Features

- Four endurance levels
  - S655DC = 25 DWPD; S650DC = 10 DWPD
  - S630DC = 2–3 DWPD; S610DC = <1 DWPD
- Micron® 16nm MLC NAND Flash
- RoHS-compliant package
- SAS
  - Interface = 12 Gb/s
  - Speed = 3 Gb/s, 6 Gb/s, 12 Gb/s, and auto-speed negotiation
  - SAS-3 support
- SAM-5 compliant
- Enterprise sector size support = 512, 520, 524, 528, 4096, 4160, 4192, and 4224-byte
- Hot-plug capable
- 128-entry command queue depth
- Digitally signed firmware for SED and non-SED
- FIPS140-2 level 2 certification option available on each S650DC 2.5-inch device: 400GB, 800GB, 1600GB, and 3200GB
- Secure erase via format unit
- Reliability
  - MTTF: 2.5 million device hours<sup>1</sup>
  - Static and dynamic wear leveling
  - Uncorrectable bit error rate (UBER):  $1 \times 10^{17}$  bits transferred
- Capacity<sup>2</sup> (unformatted): 200GB, 400GB, 480GB, 800GB, 960GB, 1600GB, 1920GB, 3200GB, 3840GB
- Endurance: TBW over warranty period<sup>4</sup>
  - S655DC (25 DWPD): 200GB-8PB, 400GB-17PB
  - S650DC (10 DWPD): 400GB-7PB, 800GB-14PB, 1600GB-29PB, 3200GB-58PB
- Endurance: TBW over warranty period<sup>4</sup>
  - S630DC (2–3 DWPD): 400GB-2.1PB, 480GB-2.6PB, 800GB-2.9PB, 960GB-5.2PB, 1600GB-5.8PB, 1920GB-10PB, 3200GB-12PB, 3840-21PB
  - S610DC (1 DWPD): 1920GB-2.8PB, 3840GB-5.6PB
- Electrical
  - Supply voltage: 5 V<sub>DC</sub> (±5%) and 12 V<sub>DC</sub> (±5%)
- Mechanical
  - 2.5-inch drive: 100.5mm × 69.85mm × 7mm, and 100.5mm × 69.85mm × 15mm
- Field-upgradeable firmware
- Power consumption: 9W (TYP) and 12W (MAX)
  - Configurable through information exceptions mode page
- Operating temperature
  - 0°C to +50°C (MAX)<sup>3</sup>

- Notes:
1. Product achieves a mean time to failure (MTTF) based on population statistics that are not relevant to individual units.
  2. 1GB = 1 billion bytes; formatted capacity is less.
  3. Based on ambient air temperature.
  4. Total bytes written (TBW): Warranty defined in the product manual is five years or device expiration as indicated by the device life indicator, whichever comes first.

**Warranty:** Contact your Micron sales representative for further information regarding the product, including product warranties.

**Table 1: Performance**

Notes apply to entire table

Device and Capacity	Sequential 128KB Transfer		Random 4KB Transfer		Random 4KB Transfer (70/30)	Average Latency (µs)
	Read (MB/s)	Write (MB/s)	Read (KIOPS)	Write (KIOPS)	Mixed Read/Write (KIOPS)

<b>S610DC</b>						
1920GB	1700	850	190	12	45	115
3840GB	1600	770	190	15	45	115

- Notes:
1. Typical I/O performance numbers: measured using an iometer in a steady state region with a queue depth of 32 for sequential and random transfers and write cache enabled; a queue depth of 1 for READ/WRITE latency values.
  2. Consistent host system interface, configurations, and variables: maintained with variation only in the drive being tested.
  3. Response time measurement conditions: recorded with nominal power at 25 °C ambient temperature.
  4. Page-to-page response times: derived from all possible page-to-page accesses on a sequentially preconditioned drive.
  5. Average response time: derived from at least 5000 access measurements between programmable pages on a randomly preconditioned drive to ensure a true statistical random average.

## Part Numbering Information

Micron's 600 series SAS SSD is available in different configurations and densities. Visit [www.micron.com](http://www.micron.com) for a list of valid part numbers.

**Figure 1: Part Number Chart**

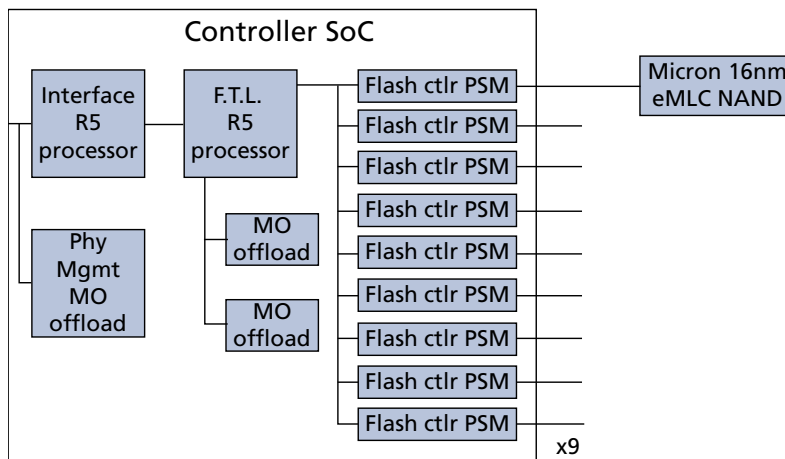

## General Description

Micron’s solid state drive (SSD) uses a single-chip controller with a dual-port SAS interface on the system side and 10 channels of Micron NAND Flash internally. Packaged in an HDD replacement enclosure, the SSD integrates easily into existing storage infrastructures.

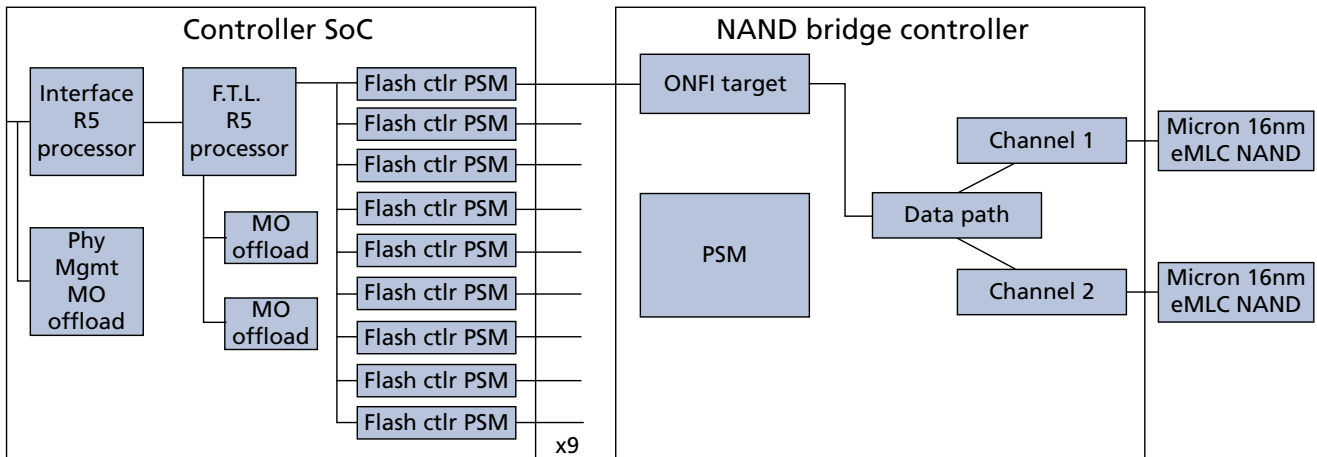

The SSD is designed to support and manage the needs of highly available, high-performance platforms that use significant read/write mixed workloads. Optimized to support enterprise needs previously supported only by single-level cell (SLC) solutions, this SSD provides endurance and data integrity required by growing environments.

## Functional Block Diagrams

**Figure 2: Functional Block Diagram – 7mm Variant (Controller Attached to NAND Directly)**

**Figure 3: Functional Block Diagram – 15mm Variant (Controller Attached to NAND by Bridge)**

## Logical Block Address Configuration

Each device is set to report its logical block address (LBA) settings, which ensure sufficient storage per device capacity. The tables below show LBA settings according to device size.

Standard OEM models are formatted to 512 bytes per block. The block size is selectable at format time, and users with the necessary equipment can modify the data block size to capacities different than those listed below before issuing a format command. To provide a stable target capacity environment while also providing users with flexibility, Micron recommends product planning.

Micron ensures that current and future product generations will meet capacity points at certain block sizes. Planning with this in mind ensures a stable operating point with backward and forward compatibility across product generations. The current operating points for each device are shown below. The capacity stated is identical when the drive is formatted with or without PI enabled.

## Programmable Drive Capacity

Using the MODE SELECT command, users can change the drive capacity to less than its maximum value. A value of zero in the Number of Blocks field means that the MODE SELECT command will leave the drive capacity unchanged. A value greater than zero and less than the maximum number of LBAs in the Number of Blocks field means that the MODE SELECT command will change the drive capacity to the value in the Number of Blocks field. A value greater than the maximum number of LBAs means that the MODE SELECT command will round down to the maximum capacity.

## Physical Configuration

### Dimensions and Weight

Form factor	Capacity (GB)	Height (mm)	Width (mm)	Length (mm)	Weight (grams)
2.5-inch	200/400/480/800/960	7.00 +0.20/-0.50	69.85 ±0.25	100.24 ±0.21	TBD
	1600/1920/3200/3840	15.00 +0.00/-0.50			

### Dual Port Support

Micron's 600 Series SAS SSD drives have two independent ports, which can be connected in the same or different SCSI domains. Each drive port has a unique SAS address.

The two ports are capable of independent port clocking. For example, both ports can run at 12 Gb/s, or the first port can run at 12 Gb/s while the second runs at 6 Gb/s. Supported link rates are 3.0, 6.0, or 12.0 Gb/s.

Subject to buffer availability, SSD drives support the following:

- Concurrent port transfers: Supports receiving COMMAND and TASK management transfers on both ports simultaneously
- Full duplex transfers: Supports sending XFER\_RDY, DATA, and RESPONSE transfers while receiving frames on both ports

### Interface Connectors

The SAS signal segment interface cable has four transmission conductors and three ground conductors for each channel. As shown in the figure below, the cable includes two 7-pin signal segments (primary and secondary) and a 15-pin power segment arranged in a single row with a 1.27mm (0.050 inch) pitch.

SAS drives use the device connector for the following:

- DC power
- SAS interface (dual port)
- Activity LED (DAS)

**Figure 4: SSD Interface Connections**

## Pin Assignments

**Table 10: Primary SAS Signal Segment Pin Assignments**

Signal Name	Type	Description
S1	GND	Second mate to ground
S2	RX0+	Positive (RX0 from target); short pin to support hot plugging
S3	RX0-	Negative (RX0 from target); short pin to support hot plugging
S4	GND	Second mate to ground
S5	TX0-	Negative (TX0 to target); short pin to support hot plugging
S6	TX0+	Positive (TX0 to target); short pin to support hot plugging
S7	GND	Second mate to ground

**Table 11: Secondary SAS Signal Segment Pin Assignments – Back Side**

Signal Name	Type	Description
S8	GND	Second mate to ground
S9	RX1+	Positive (RX1 from target); short pin to support hot plugging
S10	RX1-	Negative (RX1 from target); short pin to support hot plugging
S11	GND	Second mate to ground
S12	TX1-	Negative (TX1 to target); short pin to support hot plugging
S13	TX1+	Positive (TX1 to target); short pin to support hot plugging
S14	GND	Second mate to ground

**Table 12: SAS Power Segment Pin Assignments**

Signal Name	Type	Description
P1	V3.3	Reserved; short pin to support hot plugging; behind a SAS drive plug connector, P1 and P2 are connected only to each other.
P2	V3.3	Reserved; short pin to support hot plugging; behind a SAS drive plug connector, P1 and P2 are connected only to each other.
P3	V3.3	SAS power disable.
P4	GND	Ground
P5	GND	Ground
P6	GND	Ground
P7	V5	5V power (charge)
P8	V5	5V power; short pin to support hot plugging.
P9	V5	5V power; short pin to support hot plugging.
P10	GND	Ground
P11	DAS	Ready/Drive activity LED; short pin to support hot plugging.
P12	GND	Ground
P13	V12	12V power (charge)
P14	V12	12V power; short pin to support hot plugging.
P15	V12	12V power; short pin to support hot plugging.

## SAS Features

### Task Management

**Table 13: Task Management Functions**

Task Name	Supported
Abort task	Y
Abort task set	Y
Clear ACA	Y
Clear task set	Y
I_T nexus reset	Y
Logical unit nexus reset	Y
Query task	Y
Query task set	Y
Query asynchronous event	Y

### Task Management Responses

**Table 14: SAS Response to Task Management Functions**

Function Name	Response Code
Function complete	0
Invalid frame	2
Function not supported	4
Function failed	5
Function succeeded	8
Invalid logical unit	9

### Thin Provisioning

The device supports thin provisioning and the READ CAPACITY 16 (9Eh) command, but the level of thin provisioning support varies by product model. Thin provisioning returns a default data pattern from a READ command to a logical block even when that block is not mapped to a physical block by a previous WRITE command.

To determine whether thin provisioning is supported and which of its features are implemented, a READ CAPACITY 16 (9Eh) command must be issued to the drive. The LBPME (logical block provisioning management enabled) bit settings indicate whether the logical unit implements LBPM (logical block provisioning management). The LBPME and LBPRZ (logical block provisioning read zeros) bit settings are shown in the table immediately below.

**Table 15: Product Configuration and Bit Settings**

Bit	Product Configuration		Bit Settings	Description
	SED Support	Non-SED Support		
LBPME	Y	Y	LBPME = 1 (Logical unit is thin provisioned)	LBPM is implemented.
			LBPME = 0 (Logical unit is fully provisioned)	LBPM is not implemented.
LBPRZ	N	Y	LBPRZ = 1	For an unmapped LBA specified by a READ operation, the device server sends to the data-in buffer user data with all bits set to 0.
			LBPRZ = 0	For an unmapped LBA specified by a READ operation, the device server sends to the data-in buffer user data with all bits set to any value.

### UNMAP Command

The UNMAP command requests that the device server break the association of a specific LBA from a physical block, thereby freeing up the physical block from use and no longer requiring it to contain user data. An unmapped block will respond to a READ command with data that is determined by the setting of the LBPRZ bit in the read capacity parameter data.

### Protection Information (PI) and Security (SED)

Requirements in this section apply to any device that supports LBA unmapping. In a SCSI device, an unmapped LBA is defined as part of the thin provisioning model, whose support is indicated by an LBPME bit value of 1 in the read capacity parameter data.

When a cryptographic ERASE command erases a region of LBAs, the drive unmaps those LBAs. And when the host attempts to access an unmapped or trimmed LBA, the drive returns scrambled data.

For a given LBA, data is identical from access to access until it is either updated from the host or is cryptographically erased. Then the drive reports an LBPRZ bit value of 0 in the read capacity parameter data.

When the host attempts access to an unmapped LBA on a drive that has been formatted with protection information (PI), the drive returns scrambled PI data for that LBA.

Depending on the value of the RDPROTECT field in the data-access command CDB, the drive might return a standard PI error to the host. When a host reduces a drive's addressable capacity via a MODE SELECT command, the drive unmaps or trims any LBA within the inaccessible region of the device. Additionally, an UNMAP command is not permitted on a locked band. PI and SED drive configuration information is shown below.

**Table 16: PI and SED**

PI and SED Bit Definition	Drive Configuration					
	Standard (Non-SED)			SED		
PI setting	Disabled	Enabled		Disabled	Enabled	
PROT_EN bit	0	1		0	1	
LBPME bit	1	1		1	1	
LBPRZ bit	1	1		0	0	
PI check requested	NA	Yes	No	NA	Yes	No
DATA returned for thin provisioned LBA	0x00	0x00	0x00	Random	None	Random
PI returned for thin provisioned LBA	None	0xFF	0xFF	None	None	Scrambled PI data
PI check performed	NA	No	No	NA	Yes	No
Error reported to host	No	No	No	None	Yes	No

## Format Unit

The device may be formatted either as a thin provisioned device or a fully provisioned device. Thin provisioned is the default format and is recommended for most applications. Thin provisioning provides the most flexibility for the device to manage the Flash medium to maximize endurance.

**Table 17: Format Unit Command Execution Times for 512-Byte LBAs**

Format Mode	DCRT Bit	IP Bit	All S600DC Series Devices (Capacity in GB)									Unit
			200	400	480	800	960	1600	1920	3200	3840	
<b>Non-SED Configuration</b>												
Thin provisioned (Default)	0	0	5	5	5	5	5	5	5	5	5	minutes
Thin provisioned (Default)	1	0	5	5	5	5	5	5	5	5	5

04	Read reverse error counter page
10	Selt-test results page
11	Solid state media log page
0E	Start-stop cycle counter page
0D	Temperature page
38	Vendor unique page
3C	Vendor unique page
05	Verify error counter page
02	Write error counter page

**Table 23: Internal Drive Characteristics**

<b>Characteristic</b>	<b>Description</b>
Memory type	NAND Flash MLC
Emulated LBA size (bytes)	512
	520
	524
	528
	4096
	4160
	4192
	4224
Native programmable	Page size = 8192 user bytes
	Map unit size = 4096
Default transfer	Alignment offset = 0

## Reliability

A Micron SSD incorporates advanced technology for defect and error management, using various combinations of hardware-based error correction algorithms and firmware-based static and dynamic wear-leveling algorithms.

Over the life of the SSD, uncorrectable errors may occur. An uncorrectable error is defined as data that the device reports as successfully programmed, but when read, the data differs from what was programmed.

The following reliability specifications assume correct host and drive operational interface, including all interface timings, power supply voltages, environmental requirements, and drive mounting constraints.

**Table 24: Uncorrectable Bit Error Rate**

Read Error Rates	READ Operation
Less than 1 LBA in $10^{17}$ bits transferred	Unrecovered READ
Less than 1 LBA in $10^{21}$ bits transferred	Mis-corrected READ

Note: 1. Error rate specified with automatic retries and data correction with ECC enabled and all flaws reallocated.

## Mean Time Between Failures

SSD mean time to failure (MTTF) and mean time between failures (MTBF) are predictable based on component reliability data using the methods referenced in the Telcordia SR-332 reliability prediction procedures for electronic equipment.

**Table 25: MTBF**

Capacity	All S600DC Series Devices	
	MTBF (Million Hours)	Failure Rate (% per-Year)
200GB	2.5	0.35
400GB	2.5	0.35
480GB	2.5	0.35
800GB	2.5	0.35
960GB	2.5	0.35
1600GB	2.5	0.35
1920GB	2.5	0.35
3200GB	2.5	0.35
3840GB	2.5	0.35

## Data Retention

As a NAND Flash device ages with use, its capability to retain a programmed value is affected by the number of PROGRAM and ERASE operations to its cells, causing deterioration. When new, the device has a powered-off data retention capability of several years, but with use, data retention is reduced.

Temperature also affects how long the device retains its programmed value when power is removed. High temperature reduces retention capability when power is off, but is not an issue when power is applied. The SSD drive contains firmware and hardware features that can monitor and refresh memory cells when power is applied.

**Table 26: Data Retention and Drive Writes Per-Day**

Device and Capacity	Typical Data Retention with Power Removed (Months) <sup>1</sup>	Drive Writes per-Day (DWPD)
<b>S655DC</b>		
200GB	3	25
400GB	3	25
<b>S650DC</b>		
400GB	3	10
800GB	3	10
1600GB	3	10
3200GB	3	10
<b>S630DC</b>		
400GB	3	2
480GB	3	3
800GB	3	2
960GB	3	3
1600GB	3	2
1920GB	3	3
3200GB	3	2
3840GB	3	3
<b>S610DC</b>		
1920GB	3	<1
3840GB	3	<1

Note: 1. Typical data retention with power removed, at 40 °C and up to 90% of write endurance.

### Endurance

Endurance rating is the expected amount of host data that can be written by product when subjected to a specified workload at a specified operating and storage temperature over the specified product life. For the specific workload to achieve this level of endurance, refer to JEDEC specification JESD218. TBW is defined as  $1 \times 10^{12}$  bytes.

**Table 27: Endurance**

Device and Capacity	Endurance	Unit
<b>S655DC</b>		
200GB	8000	TBW
400GB	17,000	
<b>S650DC</b>		
400GB	7000	TBW
800GB	14,000	
1600GB	29,000	
3200GB	58,000	
<b>S630DC</b>		
400GB	2100	TBW
480GB	2600	
800GB	2900	
960GB	5200	
1600GB	5800	
1920GB	10,000	
3200GB	12,000	
3840GB	21,000	
<b>S610DC</b>		
1920GB	2800	TBW
3840GB	5600	

- Notes:
- Limited warranty with media usage provides coverage either for the warranty period or until the SSD percentage used endurance indicator reaches 100, whichever comes first.
  - TBW per the JEDEC JESDS218 specification assuming typical workloads are 50% sequential and 50% random and consist of the following: 5% are 4KB; 5% are 8KB; 10% are 16KB; 10% are 32KB; 35% are 64KB; and 35% are 128KB.

### Electrical Characteristics

Device DC power (+12V and +5V) is through the standard SAS interface. Typical power measurements listed below are based on an average of drives tested, under nominal conditions, using the listed input voltage at 60°C internal temperature. Measurements are made at 12Gb interface speeds.

- Startup power: Measured from power-on to when the drive reaches operating condition and can process media access commands.
- Peak operating mode power: Measured by testing the drive in various read and write access patterns that simulate worst case power consumption.
- Idle mode power: Measured when the drive is powered up and ready for media access commands, but before the host has sent the commands.

**Note:** Stresses greater than those listed in the following tables may cause permanent damage to the device. These are stress ratings only and device operation above ratings or conditions listed in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## Power Consumption

### Specifications

**Table 28: Power Consumption Specifications**

Device and Capacity	V <sub>DC</sub> Start Current <sup>1</sup>			Average Idle Power (W)	Average Power Under Workload (W) <sup>2</sup>		Configurable Power Limit Settings
	+5A	+12A	Power (W)		Sequential Read	Sequential Write	
<b>S655DC</b>							
200GB	1.05	0.34	9.29	3.54	5.10	6.79	6, 7, 8, 9, 10, 11
400GB	1.05	0.34	9.29	3.54	5.10	6.79	6, 7, 8, 9, 10, 11
<b>S650DC</b>							
400GB	1.05	0.34	9.29	3.54	5.10	6.79	6, 7, 8, 9, 10, 11

1600GB	0.93	0.50	10.62	4.14	7.33	10.78	8, 9, 10, 11, 12, 13, 14
3200GB	0.94	0.61	12.06	5.40	9.15	13.15	9, 10, 11, 12, 13, 14, 15
<b>S630DC</b>							
400GB	1.05	0.34	9.29	3.54	5.10	6.79	6, 7, 8, 9, 10, 11
480GB	1.05	0.34	9.29	3.54	5.10	6.79	6, 7, 8, 9, 10, 11
800GB	1.05	0.34	9.29	3.54	5.10	6.79	6, 7, 8, 9, 10, 11
960GB	1.05	0.34	9.29	3.54	5.10	6.79	6, 7, 8, 9, 10, 11
1600GB	0.93	0.50	10.62	4.14	7.33	10.78	8, 9, 10, 11, 12, 13, 14
1920GB	0.90	0.49	10.41	4.17	7.36	10.65	8, 9, 10, 11, 12, 13, 14
3200GB	0.94	0.61	12.06	5.40	9.15	13.15	9, 10, 11, 12, 13, 14, 15
3840GB	0.98	0.59	11.96	5.93	9.29	13.30	9, 10, 11, 12, 13, 14, 15
<b>S610DC</b>							
1920GB	0.90	0.49	10.41	4.17	7.36	10.65	8, 9, 10, 11, 12, 13, 14
3840GB	0.98	0.59	11.96	5.93	9.29	13.30	9, 10, 11, 12, 13, 14, 15

- Notes:
1. Measured with average reading DC ammeter. Instantaneous +12V current peaks will exceed these values. Power supply at nominal voltage. Number of drives tested = 6 at 60 °C internal.
  2. Sequential READ and WRITE operations are based on 128K block transfer at queue depth = 32.

### Identifier and Supported Settings

Supported power consumption identifier settings are shown in the table below. An INQUIRY SCSI command or MODE SENSE command can be used to query VPD page 0x8D for supported power levels and associated identifiers.

The MODE SENSE and SELECT commands can be used to read, write, and modify the mode page 0x1A, subpage 1. When the SELECT command is used to write a new identifier value, the value is saved in nonvolatile memory, unchanged until modified.

**Table 29: Power Consumption Identifier and Supported Settings**

Note 2 applies to entire table.

Device and Capacity	Mode Page							Unit
	0x0 (Default)	0x1	0x2	0x3	0x4	0x5	0x6	
<b>S655DC</b>								
200GB	11	10	9	8	7	6	N/A	W
400GB	11	10	9	8	7	6	N/A	
<b>S650DC</b>								
400GB	11	10	9	8	7	6	N/A	W
800GB	11	10	9	8	7	6	N/A	
1600GB	14	13	12	11	10	9	8	
3200GB	15	14	13	12	11	10	9	
<b>S630DC</b>								
400GB	11	10	9	8	7	6	N/A	W
480GB	11	10	9	8	7	6	N/A	
800GB	11	10	9	8	7	6	N/A	
960GB	11	10	9	8	7	6	N/A	
1600GB	14	13	12	11	10	9	8	
1920GB	14	13	12	11	10	9	8

3840GB	15	14	13	12	11	10	9	
<b>S610DC</b>								
1920GB	14	13	12	11	10	9	8	W
3840GB	15	14	13	12	11	10	9	

Note: 1. Device settings can be configured by modifying VPD mode page 0x1A, subpage 0x1.

## Power

**Table 30: Power Specifications**

Parameter/Condition	V <sub>DC</sub> (Margin)	Min	Max	Unit
Voltage input – Start up	12 (±10%)	10.8	13.2	V <sub>DC</sub>
Voltage input – Steady state	12 (±5%)	11.4	12.6	
Voltage input	5 (±5%)	4.75	5.25	

## Environmental Specifications

**Table 31: Environmental Specifications – 1**

Parameter/Condition	Min	Max	Unit
Operating temperature <sup>1</sup>	32/0	122/50	°F/°C
Non-operating temperature	-40/-40	165/75	
Rate of temperature change	-	36/20	
Relative humidity (non-condensing)	5	95	%rh
Relative humidity (rate of change /hr)	-	20	
Effective altitude (operating)	-1000/304.8	10,000/3048	ft/M
Effective altitude (non-operating)	-1000/304.8	40,000/12,192	

Note: 1. Based on ambient air temperature

**Table 32: Environmental Specifications – 2**

Parameter	Condition	Max	Unit
Operating shock (half sine wave)	Gs	1000	g
	Duration	0.5	ms
	Interval	2	sec
Non-operating shock (half sine wave)	Gs	1000	g
	Duration	0.5	ms
	Interval	2	sec

## Regulatory Compliance

Micron SSDs comply with the following:

- RoHS
- CE (Europe): EN55032, EN55024 Class B, RoHS
- FCC: CFR Title 47, Part 15 Class B
- UL (US): approval to UL-60950-1, 2nd Edition, IEC 60950-1:2005, 2nd Edition; Am 1:2009, EN 60950-1 (2006) + A11:2009+ A1:2010 + A12:2011 + A2:2013
- BSMI (Taiwan): approval to CNS 13438 Class B, CNS 15663
- RCM (Australia, New Zealand): AS/NZS CISPR32 Class B
- KC RRL (Korea): approval to KN32 Class B, KN 35 Class B
- W.E.E.E.: Compliance with EU WEEE directive 2012/19/EC. Additional obligations may apply to customers who place these products in the markets where WEEE is enforced.
- TUV (Germany): approval to IEC60950/EN60950
- VCCI (Japan): 2014-04 Class B
- IC (Canada): ICES-003 Class B
  - This Class B digital apparatus complies with Canadian ICES-003.
  - Cet appareil numérique de la classe B est conforme à la norme NMB-003 du Canada.

## FCC Rules

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at one's own expense.

## Package Dimensions

Figure 6: 2.5-Inch Package – 15mm

## **SAS References**

- Serial Attached SCSI-3 (SAS-3)
- SCSI Architecture Model-5 (SAM-5)
- SCSI Primary Commands-3 (SPC-3)
- SCSI Primary Commands-4 (SPC-4)
- SCSI ATA Translation-2 (SAT-2)
- SCSI Block Commands-3 (SBC-3)

## Revision History

### Rev. H – 9/17

- Change Power Pin P3 to SAS Power Disable from NC
- Updated Regulatory Compliance section

### Rev. G – 10/16

- Production status
- Updated DWPD endurance specification for S630DC 400GB

### Rev. F – 3/16

- Updated LBA setting tables, power matrix table, performance numbers, and endurance specifications

### Rev. E – 12/15

- Updated Performance table in Features section

### Rev. D – 11/15

- Revised maximum operating temperature to 50°C

### Rev. C – 9/15

- Revised specifications, densities, and MPNs

### Rev. B – 6/15

- Revised specifications, densities, and MPNs

### Rev. A – 5/15

- Initial release
