Overview

1 Overview

The OPTIGA™ TPM SLB 9673 is a Trusted Platform Module. It is available in PG-UQFN-32-1,-2 package. It supports an I2C interface with a transfer rate of up to 1 MHz. The OPTIGA™ TPM SLB 9673 is a TPM based on TCG family 2.0 specifications (see [1] and [2]).

This TPM product is targeted to be certified, using the Common Criteria for Information Technology Security Evaluation (CC), Version 3.1 Rev.5, in the level EAL4+, AVA_VAN.4 (moderate), ALC_FLR.1 according to the Protection Profile PC Client Specific TPM, TPM Library Specification Family "2.0" Level 0 Revision 1.59 (CERTIFICATE <td>¹⁾).

1.1 Power management

In the OPTIGA™ TPM SLB 9673, power management is handled internally; no explicit power-down or standby mode is available. The device automatically enters a low-power state after each successful command/response transaction. If a transaction is started on the I2C bus from the host platform, the device will wake immediately and will return to the low-power mode after the transaction has been finished.

1.2 Device address

The I2C interface uses 7-bit addressing. The default address of the device is 0x2E (also see [2]).

2 Device types and ordering information

The OPTIGA™ TPM SLB 9673 product family features devices using an UQFN package. **Table 1** shows the available versions.

Properties defined within the TPM can be read with the command TPM2_GetCapability. The values are vendor dependent or determined by a platform-specific specification. The following properties are returned by the Infineon OPTIGA™ TPM SLB 9673 using the command TPM2_GetCapability (capability = TPM_CAP_TPM_PROPERTIES):

1) The build- and version numbers given here are examples and do not necessarily match the numbers of the device this data sheet has been provided for.

4.1 TPM register polling

Processing of accesses to registers creates a load on the TPM.

If registers are polled in quick succession, the time until the TPM reaches the target state is increased, which decreases performance and may even lead to violation of maximum timeout values.

To prevent this, a minimum delay between register read accesses must be respected when polling:

- Minimum delay between TPM register reads for polling of TPM_STS_x during command execution: 1 ms
- Minimum delay between TPM register reads for polling of TPM_STS_x after device reset before commandReady set: 1 ms
- Minimum delay between TPM register reads for all other TPM register polling, including TPM_STS_x.commandReady set between command, TPM_STS_x.valid and TPM_STS_x.burstCount: 100 µs

5.4.1 I2C Interface Characteristics

The electrical characteristics are compliant to the NXP I²C bus specification [1] for “standard-mode” ($f_{SCL} \leq 100\text{ kHz}$), “fast-mode” ($f_{SCL} \leq 400\text{ kHz}$) and “fast-mode plus” ($f_{SCL} \leq 1000\text{ kHz}$), with certain deviations stated in Table 14, Table 15, and Table 16 below.

For printed circuit board design the reduced output fall time t_{OF} compared to the NXP I²C bus specification needs to be considered!

$T_A = 25^\circ\text{C}$, $V_{DD} = 3.3\text{V} \pm 0.3\text{V}$ or $V_{DD} = 1.8\text{V} \pm 0.15\text{V}$ unless otherwise noted.
