* All typicals at $T_A = 25^\circ\text{C}$ **Note**

1. Test voltage must be applied within dv/dt rating.
2. This is static dv/dt. See Figure 1 for test circuit. Commutating dv/dt is function of the load-driving thyristor(s) only.
3. All devices are guaranteed to trigger at an I_F value less than or equal to max I_{FT} . Therefore, recommended operating I_F lies between max I_{FT} (15 mA for FODM3010 and FODM3021, 10 mA for FODM3011 and FODM3022, 5 mA for FODM3012 and FODM3023) and absolute max I_F (60 mA).

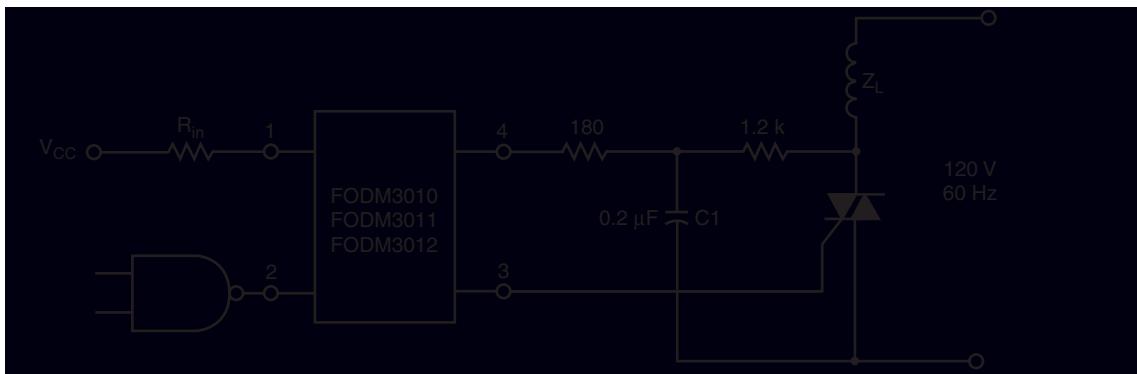

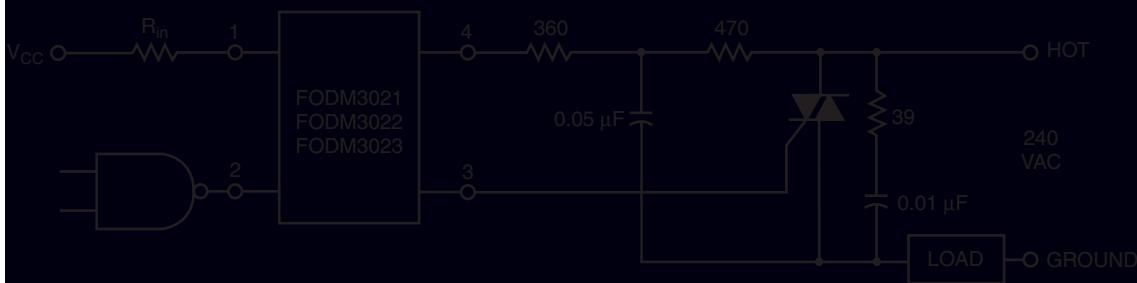

Figure 11. Inductive Load with Sensitive Gate Triac ($I_{GT} \leq 15 \text{ mA}$)

In this circuit the "hot" side of the line is switched and the load connected to the cold or ground side.

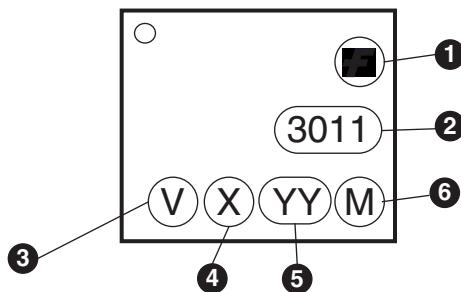

The 39 ohm resistor and 0.01 μF capacitor are for snubbing of the triac, and the 470 ohm resistor and 0.05 μF capacitor are for snubbing the coupler. These components may or may not be necessary depending upon the particular load used.
