FemtoClock® Crystal-to-LVDS Clock Generator

844031-01

PRODUCT DISCONTINUATION NOTICE - LAST TIME BUY EXPIRES MAY 6, 2017

DATA SHEET

General Description

The 844031-01 is an Ethernet Clock Generator. The 844031-01 uses an 18pF parallel resonant crystal over the range of 19.6MHz - 27.2MHz. For Ethernet applications, a 25MHz crystal is used to generate 312.5MHz. The 844031-01 has excellent <1ps phase jitter performance, over the 1.875MHz - 20MHz integration range. The 844031-01 is packaged in a small 8-pin TSSOP, making it ideal for use in systems with limited board space.

Features

- One differential LVDS output
- Crystal oscillator interface, 18pF parallel resonant crystal (19.6MHz - 27.2MHz)
- Output frequency range: 245MHz - 340MHz
- VCO range: 490MHz - 680MHz
- RMS phase jitter @ 312.5MHz, using a 25MHz crystal (1.875MHz - 20MHz): 0.53ps (typical)
- 3.3V or 2.5V operating supply
- 0°C to 70°C ambient operating temperature
- Available in lead-free (RoHS 6) package
- For functional replacement part use 8T49N242

APPLICATION INFORMATION

POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The 844031-01 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD} and V_{DDA} should be individually connected to the power supply plane through vias, and 0.01µF bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic V_{DD} pin and also shows that V_{DDA} requires that an additional10Ω resistor along with a 10µF bypass capacitor be connected to the V_{DDA} pin.

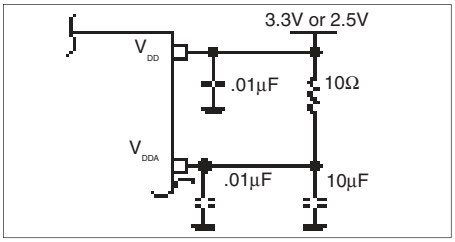

FIGURE 1. POWER SUPPLY FILTERING

CRYSTAL INPUT INTERFACE

The 844031-01 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using a 25MHz, 18pF parallel resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

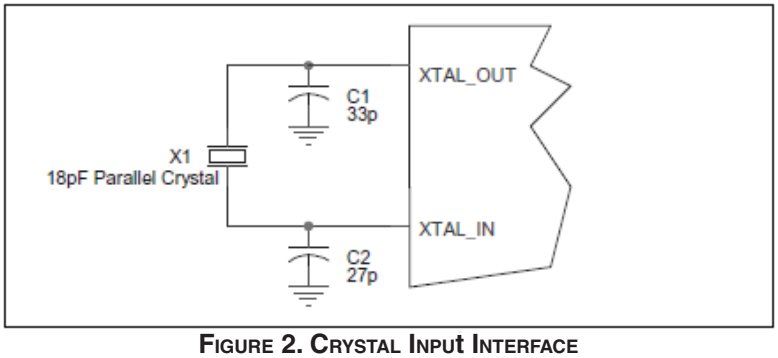

FIGURE 2. CRYSTAL INPUT INTERFACE

3.3V, 2.5V LVDS Driver Termination

A general LVDS interface is shown in *Figure 4* In a 100Ω differential transmission line environment, LVDS drivers require a matched load termination of 100Ω across near the receiver input. For a multiple LVDS outputs buffer, if only partial outputs are used, it is recommended to terminate the unused outputs.

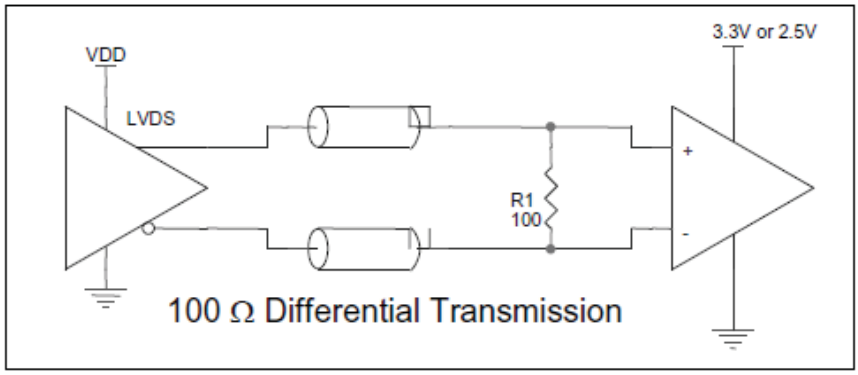

Figure 4. Typical LVDS Driver Termination

Application Schematic

Figure 5A provides a schematic example of 844031-01. In this example, an 18 pF parallel resonant crystal is used. The C1= 22pF and C2 = 22pF are recommended for frequency. The C1 and C2 values may be slightly adjusted for optimizing frequency accuracy. At least one decoupling capacitor near the power pin is required. Suggested value range is from 0.01uF to 0.1uF. Other filter type can be added depending on the system power supply noise type.

PC Board Layout Example

Figure 5B shows an example of 844031-01 P.C. board layout. The crystal X1 footprint shown in this example allows installation of either surface mount HC49S or through-hole HC49 package. The footprints of other components in this example are listed in the *Table 6.* There should be at least one decoupling capacitor per power pin. The decoupling capacitors should be located as close as possible to the power pins. The layout assumes that the board has clean analog power ground plane.

POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the 844031-01.
Equations and example calculations are also provided.

1. Power Dissipation.
The total power dissipation for the 844031-01 is the sum of the core power plus the analog power plus the power dissipated in the load(s). The following is the power dissipation for V_{DD} = 3.3V + 5% = 3.465V, which gives worst case results.

- Power $(core)_{MAX} = V_{DD\_MAX} * (I_{DD\_MAX} + I_{DDA\_MAX})$ = 3.465V * (75mA + 10mA) = **294.5mW**

2. Junction Temperature.
Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C.

The equation for Tj is as follows: $Tj = \theta_{JA} * Pd\_total + T_A$

Tj = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)
T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 129.5°C/W per Table 7 below.

Therefore, Tj for an ambient temperature of 70°C with all outputs switching is:
70°C + 0.294W * 129.5°C/W = 108.1°C. This is well below the limit of 125°C.

This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).
