## MAX2754 Evaluation Kit

**Evaluates: MAX2754**

### General Description

The MAX2754 evaluation kit (EV kit) simplifies evaluation of the MAX2754 VCO. This kit enables testing of the device's RF performance and requires no additional support circuitry. The signal output uses an SMA connector to facilitate the connection to RF test equipment.

### Test Equipment Required

This section lists the recommended test equipment to verify operation of the MAX2754. It is intended as a guide only, and some substitutions are possible.

- Three power supplies at +2.7V to +5.5V
- An ammeter (optional)
- An RF spectrum analyzer (HP 8561E, for example) that covers the operating frequency range of the MAX2754, as well as a few harmonics
- A 50 $\Omega$  SMA cable

### Connections and Setup

This section provides a step-by-step guide to the functions and operation of these EV kits.

- 1) Connect a DC supply set to +3V (through an ammeter, if desired) to the V<sub>CC</sub> and GND terminals on the EV kit.
- 2) Apply +3V to the  $\overline{\text{SHDN}}$  control input.
- 3) Turn on the DC supply. The supply current should read about 13.5mA.
- 4) Connect the VCO output to a spectrum analyzer with a 50 $\Omega$  coaxial cable (minimize length).
- 5) Apply a variable DC voltage to the TUNE input (+0.4V to +2.4V).
- 6) Check f<sub>MIN</sub> and f<sub>MAX</sub> on the spectrum analyzer by varying the tuning voltage.
- 7) Apply a variable DC voltage to the MOD input (+0.4V to +2.4V).
- 8) Check modulation peak frequency deviation on the spectrum analyzer by varying the modulation voltage.
- 9) Check the output power level (-5dBm typ).
