

9-Bit Odd/Even Parity Generator/Checker

High-Performance Silicon-Gate CMOS

The MC74HC280 is identical in pinout to the LS280. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

This circuit consists of 9 data-bit inputs (A through I) and 2 outputs (Even Parity and Odd Parity) to allow both odd and even parity applications. Words greater than 9-bits can be accommodated by cascading other HC280 devices.

This device can be used in systems utilizing the LS180 parity generator/checker. Although the HC280 does not have expander inputs, the corresponding function is provided by an input at pin 4 and the absence of any connection at pin 3. This permits the HC280 to be substituted for the LS180 to produce a similar function, even if the HC280s are mixed with existing LS180s. NOTE: Pullup resistors must be used on the LS180 outputs to interface with the HC280.

- Output Drive Capability: 10 LSTTL Loads
- Outputs Directly Interface to CMOS, NMOS, and TTL
- Operating Voltage Range: 2 to 6 V
- Low Input Current: 1 μ A
- High Noise Immunity Characteristic of CMOS Devices
- In Compliance with the Requirements Defined by JEDEC Standard No. 7A
- Chip Complexity: 226 FETs or 56.5 Equivalent Gates

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND ≤ (V_{in} or V_{out}) ≤ V_{CC}. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

* Maximum Ratings are those values beyond which damage to the device may occur. Functional operation should be restricted to the Recommended Operating Conditions.

† Derating — Plastic DIP: - 10 mW/°C from 65° to 125°C
SOIC Package: - 7 mW/°C from 65° to 125°C

For high frequency or heavy load considerations, see Chapter 2.

* Used to determine the no-load dynamic power consumption: $P_D = C_{PD} V_{CC}^2 f + I_{CC} V_{CC}$. For load considerations, see Chapter 2.

PIN DESCRIPTIONS

INPUTS

A, B, C, D, E, F, G, H, I (Pins 8–13, 1, 2, 4)

Nine-bit data—word inputs. The data word placed on these pins is checked for even or odd parity.

OUTPUTS

Even Parity (Pin 5)

Even-parity output. This pin goes high if the data word has even parity and low if the data word has odd parity.

Odd Parity (Pin 6)

Odd-parity output. This pin goes high if the data word has odd parity and low if the data word has even parity.
