2-Wire Automotive Temperature Serial EEPROM
1K (128 x 8), 2K (256 x 8), 4K (512 x 8), or 8K (1,024 x 8)

DATASHEET

Features

- Medium-voltage and Standard-voltage Operation
 - 2.5V ($V_{CC} = 2.5V$ to 5.5V)
- Automotive Temperature Range $-40^{\circ}C$ to $125^{\circ}C$
- Internally Organized 128 x 8 (1K), 256 x 8 (2K), 512 x 8 (4K), or 1,024 x 8 (8K)
- 2-Wire Serial Interface
- Schmitt Trigger, Filtered Inputs for Noise Suppression
- Bidirectional Data Transfer Protocol
- 400kHz (2.5V) Compatibility
- Write Protect Pin for Hardware Data Protection
- 8-byte Page (1K, 2K) or 16-byte Page (4K, 8K) Write Modes
- Partial Page Writes are Allowed
- Self-timed Write Cycle (5ms max)
- High-reliability
 - Endurance: 1,000,000 Write Cycles
 - Data Retention: 100 Years
- 8-lead JEDEC SOIC and 8-lead TSSOP Packages

Description

The AT24C01B/02B/04B/08B Automotive provides 1,024/2,048/4,096/8,192 bits of Serial Electrically Erasable and Programmable Read-only Memory (EEPROM) organized as 128/256/512/1,024 words of 8 bits each. The device is optimized for use in many automotive applications where low-power and low-voltage operation are essential. The AT24C01B/02B/04B/08B Automotive is available in space-saving 8-lead JEDEC SOIC and 8-lead TSSOP packages and is accessed via a 2-wire serial interface. In addition, the entire family operates at voltages from 2.5V to 5.5V.

1. Pin Configurations and Pinouts

Table 1-1. Pin Configurations

Pin Name	Function
A ₀ – A ₂	Address Inputs
GND	Ground
SDA	Serial Data
SCL	Serial Clock Input
WP	Write Protect
V _{CC}	Power Supply

Note: Drawings are not to scale.

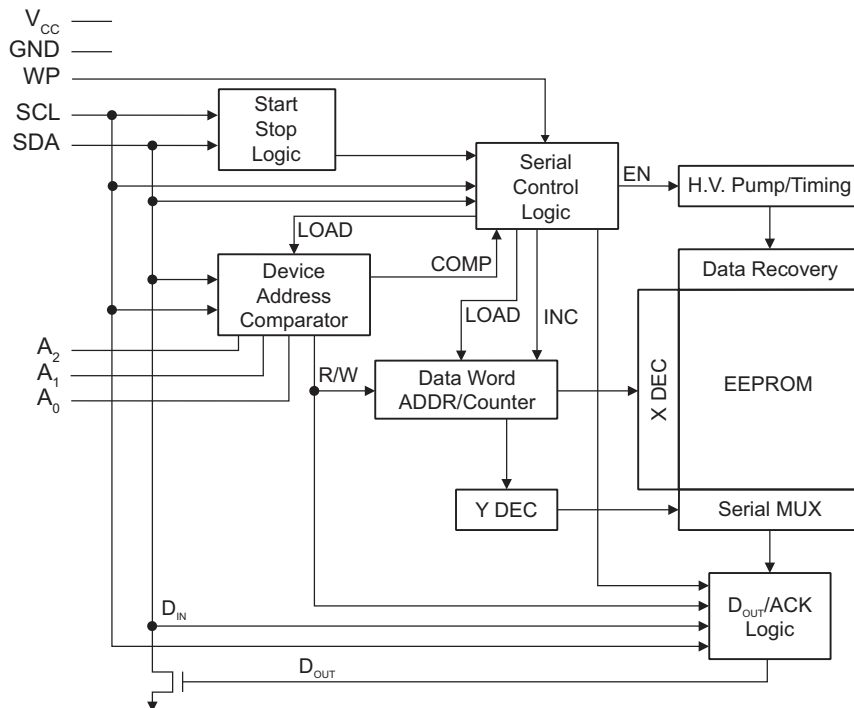

2. Absolute Maximum Ratings*

Operating Temperature	–55°C to +125°C
Storage Temperature	–65°C to +150°C
Voltage on Any Pin with Respect to Ground	–1.0V to +7.0V
Maximum Operating Voltage	6.25V
DC Output Current	5mA

*Notice: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

3. Block Diagram

Figure 3-1. Block Diagram

4. Pin Description

Serial Clock (SCL): The SCL input is used to positive edge clock data into each EEPROM device and negative edge clock data out of each device.

Serial Data (SDA): The SDA pin is bidirectional for serial data transfer. This pin is open-drain driven and may be wire-ORed with any number of other open-drain or open-collector devices.

Device/Page Addresses (A_2 , A_1 , and A_0): The A_2 , A_1 , and A_0 pins are device address inputs which are hard wired for the AT24C01B/02B/04B/08B Automotive. As many as eight 1K/2K devices may be addressed on a single bus system (device addressing is discussed in detail under the Device Addressing section). The AT24C04B uses the A_2 and A_1 inputs for hardwire addressing and a total of four 4K devices may be addressed on a single bus system. The A_0 pin is a no connect.

The AT24C08B only uses the A_2 input for hardwire addressing and a total of two 8K devices may be addressed on a single bus system. The A_0 and A_1 pins are no connect.

Write Protect (WP): The AT24C01B/02B/04B/08B has a Write Protect pin which provides hardware data protection. The Write Protect pin allows normal Read/Write operations when connected to Ground (GND). When the Write Protect pin is connected to V_{CC} , the write protection feature is enabled and operates as shown in the following table.

Table 4-1. Write Protect

WP Pin Status	Part of the Array Protected
At V_{CC}	Full Array
At GND	Normal Read/Write Operations

5. Memory Organization

AT24C01B, 1K Serial EEPROM: Internally organized with 16 pages of 8 bytes each, the 1K requires a 7-bit data word address for random word addressing.

AT24C02B, 2K Serial EEPROM: Internally organized with 32 pages of 8 bytes each, the 2K requires an 8-bit data word address for random word addressing.

AT24C04B, 4K Serial EEPROM: Internally organized with 32 pages of 16 bytes each, the 4K requires a 9-bit data word address for random word addressing.

AT24C08B, 8K Serial EEPROM: Internally organized with 64 pages of 16 bytes each, the 8K requires a 10-bit data word address for random word addressing.

5.1 Pin Capacitance

Table 5-1. Pin Capacitance⁽¹⁾

Applicable over recommended operating range from $T_A = 25^\circ\text{C}$, $f = 400\text{kHz}$, $V_{CC} = +2.5\text{V}$.

Symbol	Test Condition	Max	Units	Conditions
$C_{I/O}$	Input/Output Capacitance (SDA)	8	pF	$V_{I/O} = 0\text{V}$
C_{IN}	Input Capacitance (A_0 , A_1 , A_2 , SCL)	6	pF	$V_{IN} = 0\text{V}$

Note: 1. This parameter is characterized and is not 100% tested.

5.2 DC Characteristics

Table 5-2. DC Characteristics

Applicable over recommended operating range from: $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{CC} = +2.5\text{V}$ to $+5.5\text{V}$ (unless otherwise noted).

Symbol	Parameter	Test Condition	Min	Typ	Max	Units
V_{CC1}	Supply Voltage		2.5		5.5	V
I_{CC}	Supply Current $V_{CC} = 5.0\text{V}$	Read at 100kHz		0.4	1.0	mA
I_{CC}	Supply Current $V_{CC} = 5.0\text{V}$	Write at 100kHz		2.0	3.0	mA
I_{SB1}	Standby Current $V_{CC} = 2.5\text{V}$	$V_{IN} = V_{CC}$ or V_{SS}		1.6	4.0	μA
I_{SB2}	Standby Current $V_{CC} = 5.0\text{V}$	$V_{IN} = V_{CC}$ or V_{SS}		8.0	18.0	μA
I_{LI}	Input Leakage Current	$V_{IN} = V_{CC}$ or V_{SS}		0.10	3.0	μA
I_{LO}	Output Leakage Current	$V_{OUT} = V_{CC}$ or V_{SS}		0.05	3.0	μA
V_{IL}	Input Low Level ⁽¹⁾		-0.6		$V_{CC} \times 0.3$	V
V_{IH}	Input High Level ⁽¹⁾		$V_{CC} \times 0.7$		$V_{CC} + 0.5$	V
V_{OL}	Output Low Level $V_{CC} = 2.5\text{V}$	$I_{OL} = 3.0\text{mA}$			0.4	V

Note: 1. V_{IL} min and V_{IH} max are reference only and are not tested.

5.3 AC Characteristics

Table 5-3. AC Characteristics

Applicable over recommended operating range from $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{CC} = +2.5\text{V}$ to $+5.5\text{V}$, $CL = 1$ TTL Gate and 100pF (unless otherwise noted).

Symbol	Parameter	Min	Max	Units
f_{SCL}	Clock Frequency, SCL		400	kHz
t_{LOW}	Clock Pulse Width Low	1.2		μs
t_{HIGH}	Clock Pulse Width High	0.6		μs
t_I	Noise Suppression Time ⁽¹⁾		50	ns
t_{AA}	Clock Low to Data Out Valid	0.1	0.9	μs
t_{BUF}	Time the bus must be free before a new transmission can start ⁽²⁾	1.2		μs
$t_{HD.STA}$	Start Hold Time	0.6		μs
$t_{SU.STA}$	Start Set-up Time	0.6		μs
$t_{HD.DAT}$	Data In Hold Time	0		μs
$t_{SU.DAT}$	Data In Set-up Time	100		ns
t_R	Inputs Rise Time ⁽²⁾		300	ns
t_F	Inputs Fall Time ⁽²⁾		300	ns
$t_{SU.STO}$	Stop Set-up Time	0.6		μs
t_{DH}	Data Out Hold Time	50		ns
t_{WR}	Write Cycle Time		5	ms
Endurance ⁽²⁾	5.0V, 25°C, Page Mode	1,000,000		Write Cycles

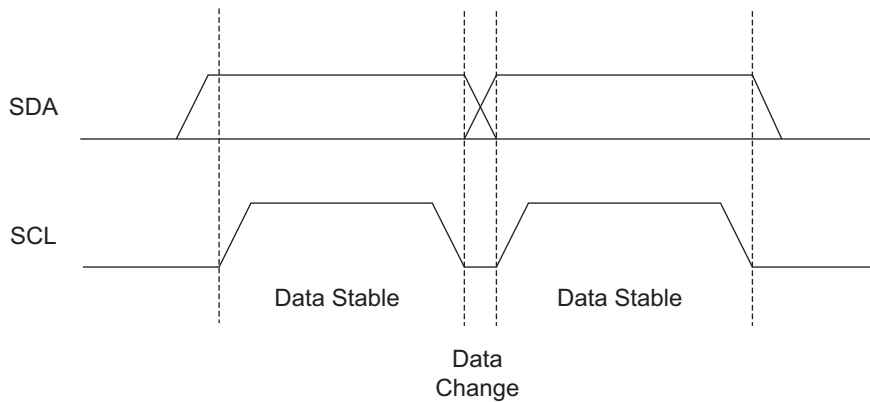

Notes: 1. This parameter is characterized and is not 100% tested ($T_A = 25^{\circ}\text{C}$).

2. This parameter is characterized only.

6. Device Operation

Clock and Data Transitions: The SDA pin is normally pulled high with an external device. Data on the SDA pin may change only during SCL low time periods. Data changes during SCL high periods will indicate a Start or Stop condition as defined below.

Figure 6-1. Data Validity

Start Condition: A high-to-low transition of SDA with SCL high is a Start condition which must precede any other command.

Stop Condition: A low-to-high transition of SDA with SCL high is a Stop condition. After a read sequence, the Stop command will place the EEPROM in a standby power mode.

Figure 6-2. Start and Stop Definition

Acknowledge: All addresses and data words are serially transmitted to and from the EEPROM in 8-bit words. The EEPROM sends a zero to acknowledge that it has received each word. This happens during the ninth clock cycle.

Figure 6-3. Output Acknowledge

Standby Mode: The AT24C01B/02B/04B/08B Automotive features a low-power standby mode which is enabled:

- Upon power-up.
- After the receipt of the Stop condition and the completion of any internal operations.

2-Wire Software Reset: After an interruption in protocol, power loss or system reset, any 2-wire part can be protocol reset by following these steps:

1. Create a Start condition.
2. Clock nine cycles.
3. Create another start but followed by Stop condition as shown below.

The device is ready for the next communication after above steps have been completed.

Figure 6-4. Software Reset

Figure 6-5. Bus Timing — SCL: Serial Clock, SDA: Serial Data I/O

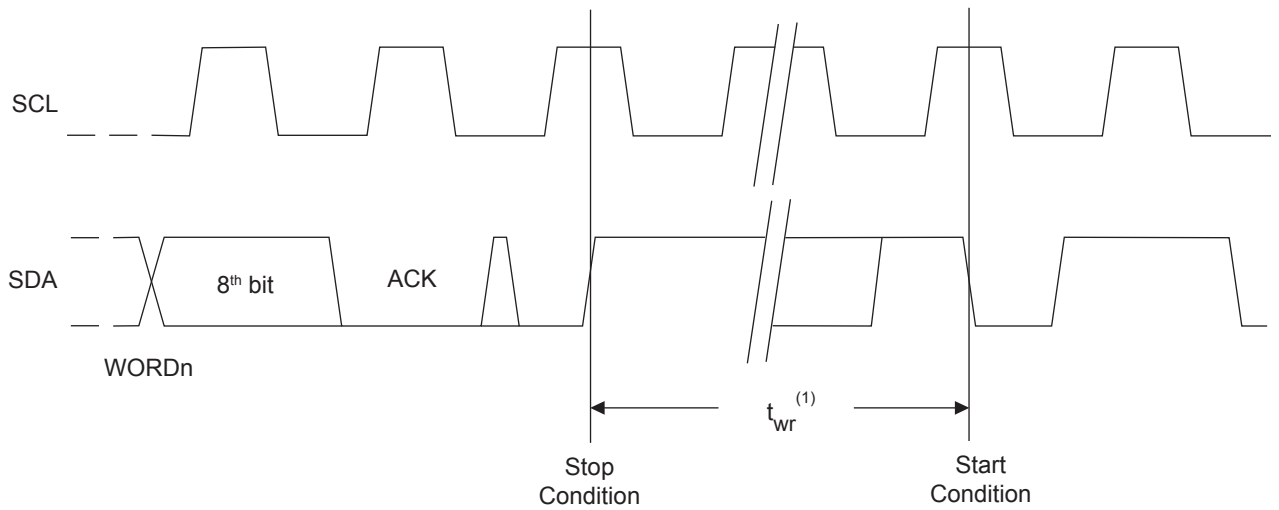

Figure 6-6. Write Cycle Timing — SCL: Serial Clock, SDA: Serial Data I/O

Note: 1. The write cycle time t_{WR} is the time from a valid Stop condition of a write sequence to the end of the internal clear/write cycle.

7. Device Addressing

The 1K/2K/4K/8K EEPROM device requires an 8-bit device address word following a Start condition to enable the chip for a Read or Write operation.

The device address word consists of a mandatory “1”, “0” sequence for the first four most significant bits as shown. This is common to all the Serial EEPROM devices.

The next three bits are the A2, A1, and A0 device address bits for the 1K/2K EEPROM. These three bits must compare to their corresponding hardwired input pins.

The 4K EEPROM only uses the A2 and A1 device address bits with the A0 bit being a memory address bit (P0). The two device address bits must compare to their corresponding hardwired input pins. The A₀ pin is no connect.

The 8K EEPROM only uses the A2 device address bit with the next two bits (P1, P0) being for memory page addressing. The A2 bit must compare to its corresponding hardwired input pin. The A₁ and A₀ pins are no connect.

The eighth bit of the device address is the Read/Write operation select bit. A Read operation is initiated if this bit is high, and a Write operation is initiated if this bit is low.

Upon a compare of the device address, the EEPROM will output a zero. If a compare is not made, the chip will return to a standby state.

Figure 7-1. Device Address

1K/2K	1	0	1	0	A2	A1	A0	R/W
	MSB				LSB			
4K	1	0	1	0	A2	A1	P0	R/W
8K	1	0	1	0	A2	P1	P0	R/W

8. Write Operations

Byte Write: A Write operation requires an 8-bit data word address following the device address word and acknowledgment. Upon receipt of this address, the EEPROM will again respond with a zero and then clock in the first 8-bit data word. Following receipt of the 8-bit data word, the EEPROM will output a zero and the addressing device, such as a microcontroller, must terminate the write sequence with a Stop condition. At this time the EEPROM enters an internally timed write cycle, t_{WR} , to the nonvolatile memory. All inputs are disabled during this write cycle and the EEPROM will not respond until the write is complete.

Figure 8-1. Byte Write

Note: * = Don't Care bit for 1K

Page Write: The 1K/2K EEPROM is capable of an 8-byte Page Write. The 4K/8K devices are capable of 16-byte Page Writes.

A Page Write is initiated the same as a Byte Write, but the microcontroller does not send a Stop condition after the first data word is clocked in. Instead, after the EEPROM acknowledges receipt of the first data word, the microcontroller can transmit up to seven (1K/2K) or fifteen (4K/ 8K) more data words. The EEPROM will respond with a zero after each data word received. The microcontroller must terminate the Page Write sequence with a Stop condition.

The data word address lower three (1K/2K) or four (4K/8K) bits are internally incremented following the receipt of each data word. The higher data word address bits are not incremented, retaining the memory page row location. When the word address, internally generated, reaches the page boundary, the following byte is placed at the beginning of the same page. If more than eight (1K/2K) or sixteen (4K/8K) data words are transmitted to the EEPROM, the data word address will roll-over and previous data will be overwritten.

Figure 8-2. Page Write

Note: * = Don't Care bit for 1K

Acknowledge Polling: Once the internally timed write cycle has started and the EEPROM inputs are disabled, Acknowledge Polling can be initiated. This involves sending a Start condition followed by the device address word. The Read/Write bit is representative of the operation desired. Only if the internal write cycle has completed will the EEPROM respond with a zero, allowing the read or write sequence to continue.

9. Read Operations

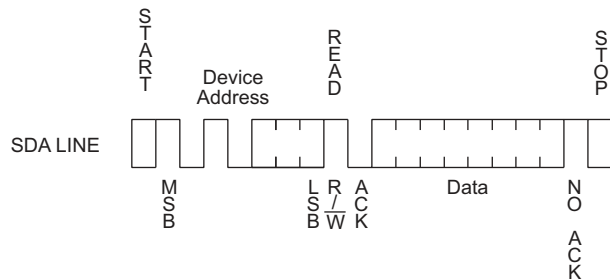

Read operations are initiated the same way as Write operations with the exception that the read/write select bit in the device address word is set to one. There are three read operations:

- Current Address Read
- Random Address Read
- Sequential Read

Current Address Read: The internal data word address counter maintains the last address accessed during the last Read or Write operation, incremented by one. This address stays valid between operations as long as the chip power is maintained. The address roll-over during read is from the last byte of the last memory page to the first byte of the first page. The address roll-over during write is from the last byte of the current page to the first byte of the same page.

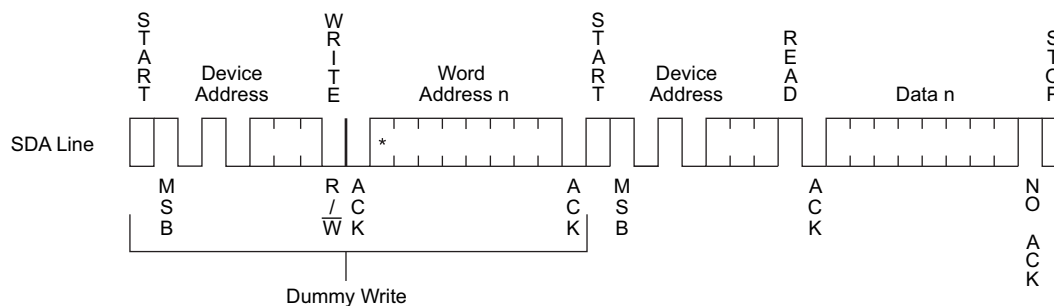

Once the device address with the read/write select bit set to one is clocked in and acknowledged by the EEPROM, the current address data word is serially clocked out. The microcontroller does not respond with an input zero but does generate a following Stop condition.

Figure 9-1. Current Address Read

Random Read: A random read requires a “dummy” Byte Write sequence to load in the data word address. Once the device address word and data word address are clocked in and acknowledged by the EEPROM, the microcontroller must generate another Start condition. The microcontroller now initiates a Current Address Read by sending a device address with the read/write select bit high. The EEPROM acknowledges the device address and serially clocks out the data word. The microcontroller does not respond with a zero but does generate a following Stop condition.

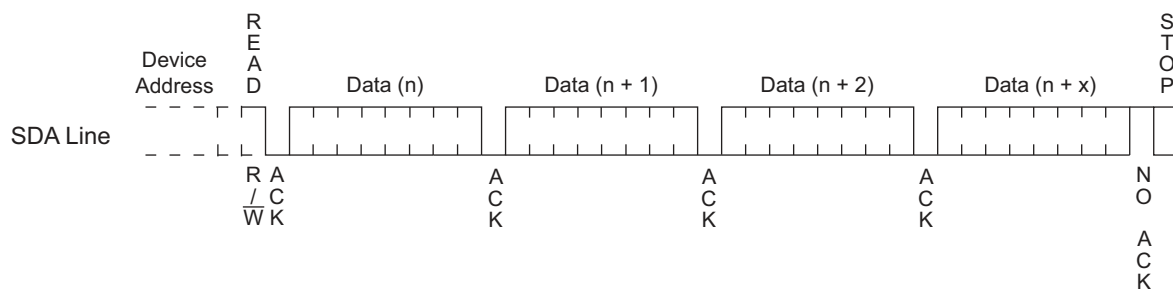

Figure 9-2. Random Read

Note: * = Don't Care bit for 1K

Sequential Read: Sequential Reads are initiated by either a Current Address Read or a random address read. After the microcontroller receives a data word, it responds with an acknowledge. As long as the EEPROM receives an acknowledge, it will continue to increment the data word address and serially clock out sequential data words. When the memory address limit is reached, the data word address will roll-over and the Sequential Read will continue. The Sequential Read operation is terminated when the microcontroller does not respond with a zero but does generate a following Stop condition.

Figure 9-3. Sequential Read

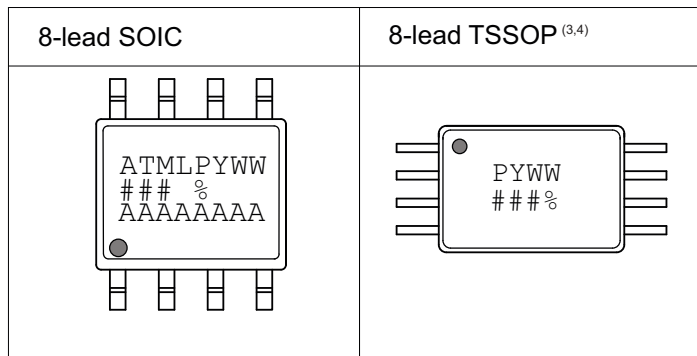

10. Power Recommendation

The device internal POR (Power-On Reset) threshold is just below the minimum operating voltage of the device. Power shall rise monotonically from 0.0Vdc to full V_{CC} in less than 1ms. Hold at full V_{CC} for at least 100 μ s before the first operation. Power shall drop from full V_{CC} to 0.0Vdc in less than 1ms. Power dropping to a non-zero level and then slowly going to zero is not recommended. Power shall remain off (0.0Vdc) for 0.5s minimum. Please consult Atmel if your power conditions do not meet the above recommendations.

11. Part Markings

AT24C01B, AT24C02B, AT24C04B & AT24C08B Automotive Package Marking Information

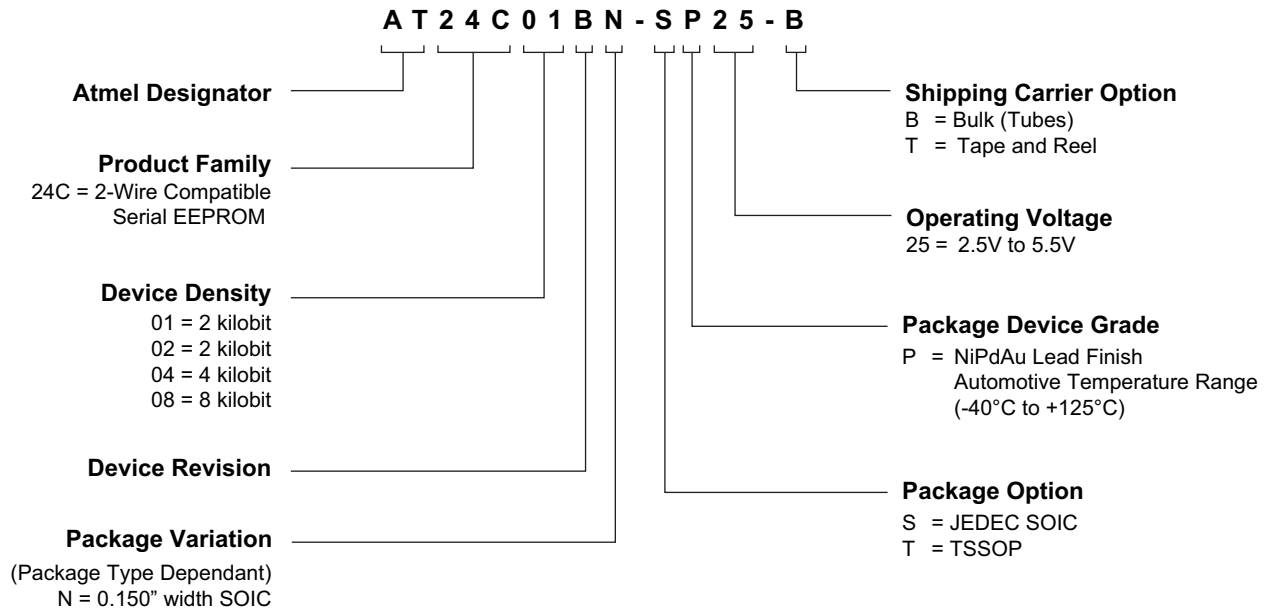

Notes 1: ● designates pin 1
 2: Package drawings are not to scale
 3: There is a space between ### and % on the 24C01B TSSOP parts.
 4: Lot Number and location of assembly is marked on the bottom side of the TSSOP Package.
