

SKYWORKS®

Si52144

PCI-EXPRESS GEN 1, GEN 2, & GEN 3 QUAD OUTPUT CLOCK GENERATOR

Features

- PCI-Express Gen 1, Gen 2, Gen 3, and Gen 4 common clock compliant
- Gen 3 SRNS Compliant
- Supports Serial ATA (SATA) at 100 MHz
- Low power, push-pull HCSL compatible differential outputs
- No termination resistors required
- Dedicated output enable hardware pins for each clock output
- Dedicated hardware pin for spread spectrum control
- Four PCI-Express clocks
- 25 MHz crystal input or clock input
- Signal integrity tuning
- I²C support with readback capabilities
- Triangular spread spectrum profile for maximum electromagnetic interference (EMI) reduction
- Industrial temperature –40 to 85 °C
- 3.3 V power supply
- 24-pin QFN package

Applications

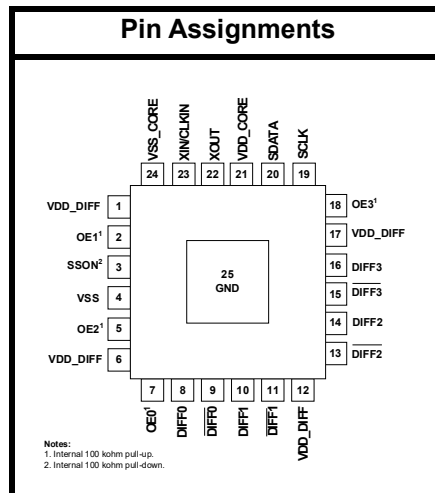

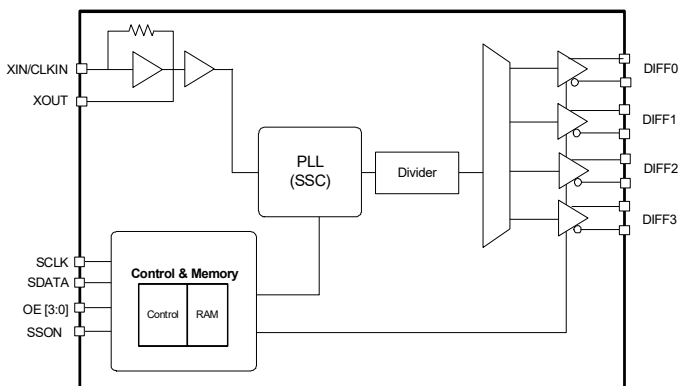

- Network attached storage
- Multi-function printer
- Wireless access point
- Routers

Description

The Si52144 is a spread-spectrum enabled PCIe clock generator that can source four PCIe clocks. The device has four hardware output enable pins for enabling the outputs, and one hardware pin to control spread spectrum on PCIe clock outputs. In addition to the hardware control pins, I²C programmability is also available to dynamically control skew, edge rate and amplitude on the true, compliment, or both differential signals on the PCIe clock outputs. This control feature enables optimal signal integrity as well as optimal EMI signature on the PCIe clock outputs.

Refer to AN636 for signal integrity and configurability. Measuring PCIe clock jitter is quick and easy with the Skyworks Solutions PCIe Clock Jitter Tool. Download it for free at <https://www.skyworksinc.com/en/application-pages/pci-express-learning-center>.

Table 3. Absolute Maximum Conditions

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Main Supply Voltage	$V_{DD_3.3V}$	Functional	—	—	4.6	V
Input Voltage	V_{IN}	Relative to V_{SS}	-0.5	—	4.6	V_{DC}
Temperature, Storage	T_S	Non-functional	-65	—	150	°C
Temperature, Operating Ambient	T_A	Functional	-40	—	85	°C
Temperature, Junction	T_J	Functional	—	—	150	°C
Dissipation, Junction to Case	θ_{JC}	JEDEC (JESD 51)	—	—	25	°C/W
Dissipation, Junction to Ambient	θ_{JA}	JEDEC (JESD 51)	—	—	37	°C/W
ESD Protection (Human Body Model)	ESD_{HBM}	JEDEC (JESD 22-A114)	2000	—	—	V
Flammability Rating	UL-94	UL (Class)	V-0			
Note: While using multiple power supplies, the voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is not required.						

2. Functional Description

2.1. Crystal Recommendations

If using crystal input, the device requires a parallel resonance 25 MHz crystal.

Table 4. Crystal Recommendations

Frequency (Fund)	Cut	Loading	Load Cap	Shunt Cap (max)	Motional (max)	Tolerance (max)	Stability (max)	Aging (max)
25 MHz	AT	Parallel	12–15 pF	5 pF	0.016 pF	35 ppm	30 ppm	5 ppm

2.1.1. Crystal Loading

Crystal loading is critical for ppm accuracy. In order to achieve low/zero ppm error, use the calculations in section “2.1.2. Calculating Load Capacitors” below to estimate the appropriate capacitive loading (CL).

Figure 1 shows a typical crystal configuration using two trim capacitors. It is important that the trim capacitors are in series with the crystal.

Figure 1. Crystal Capacitive Clarification

2.1.2. Calculating Load Capacitors

In addition to the standard external trim capacitors, consider the trace capacitance and pin capacitance to calculate the crystal loading correctly. The capacitance on each side is in series with the crystal. The total capacitance on both sides is twice the specified crystal load capacitance (CL). Trim capacitors are calculated to provide equal capacitive loading on both sides.

Figure 2. Crystal Loading Example

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

Load Capacitance (each side)

$$C_e = 2 \times CL - (C_s + C_i)$$

Total Capacitance (as seen by the crystal)

$$CL_e = \frac{1}{\left(\frac{1}{C_{e1} + C_{s1} + C_{i1}} + \frac{1}{C_{e2} + C_{s2} + C_{i2}} \right)}$$

- CL: Crystal load capacitance
- CL_e: Actual loading seen by crystal using standard value trim capacitors
- C_e: External trim capacitors
- C_s: Stray capacitance (terraced)
- C_i: Internal capacitance (lead frame, bond wires, etc.)

2.2. OE Pin Definition

The OE pins are active high inputs used to enable and disable the output clocks. To enable the output clock, the OE pin needs to be logic high and the I²C output enable bit needs to be logic high. There are two methods to disable the output clocks: the OE is pulled to a logic low, or the I²C enable bit is set to a logic low. The OE pins is required to be driven at all time and even though it has an internally 100 kΩ resistor.

2.3. OE Assertion

The OE signals are active high input used for synchronous stopping and starting the DIFF output clocks respectively while the rest of the clock generator continues to function. The assertion of the OE signal by making it logic high causes stopped respective DIFF output to resume normal operation. No short or stretched clock pulses are produced when the clock resumes. The maximum latency from the assertion to active outputs is no more than two to six output clock cycles.

2.4. OE Deassertion

When the OE pin is deasserted by making its logic low, the corresponding DIFF output is stopped cleanly, and the final output state is driven low.

2.5. SSON Pin Definition

SSON is an active input used to enable –0.5% spread on all DIFF outputs. When sampled high, –0.5% spread is enabled on all DIFF outputs. When sampled low, the DIFF output frequencies are non-spread.

3. Test and Measurement Setup

Figure 3 shows the test load configuration for the differential HCSL clock outputs.

Figure 3. 0.7 V Differential Load Configuration

Please reference application note AN781 for recommendations on how to terminate the differential outputs for LVDS, LVPECL, or CML signalling levels.

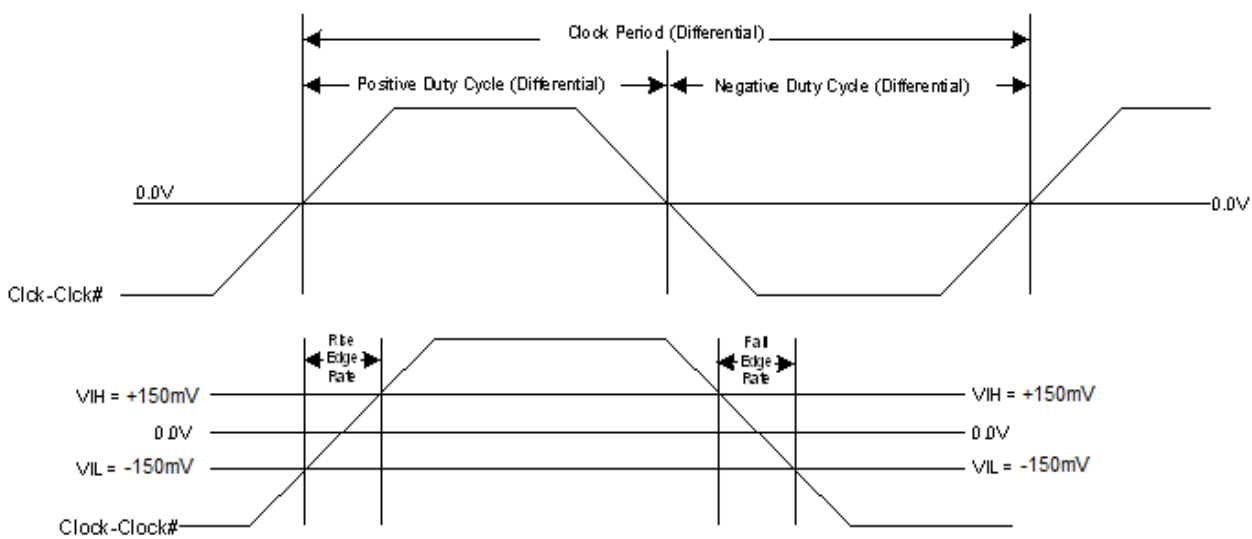

Figure 4. Differential Measurement for Differential Output Signals (for AC Parameters Measurement)

Figure 5. Single-Ended Measurement for Differential Output Signals (for AC Parameters Measurement)

4. Control Registers

4.1. I²C Interface

To enhance the flexibility and function of the clock synthesizer, an I²C interface is provided. Through the Serial Data Interface, various device functions, such as individual clock enablement. The registers associated with the I²C Interface initialize to their default setting at power-up. The use of this interface is optional. Clock device register changes are normally made at system initialization, if any are required. Power management functions can only be programed in program mode and not in normal operation modes.

4.2. Data Protocol

The clock driver I²C protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, access the bytes in sequential order from lowest to highest (most significant bit first) with the ability to stop after any complete byte is transferred. For byte write and byte read operations, the system controller can access individually indexed bytes.

The block write and block read protocol is outlined in Table 5 while Table 6 outlines byte write and byte read protocol. The slave receiver address is 11010110 (D6h).

Table 5. Block Read and Block Write Protocol

Block Write Protocol		Block Read Protocol	
Bit	Description	Bit	Description
1	Start	1	Start
8:2	Slave address—7 bits	8:2	Slave address—7 bits
