

### **Freescale Semiconductor** Data Sheet: Technical Data

# Integrated Silicon Pressure Sensor On-Chip Signal Conditioned, Temperature Compensated and Calibrated

The MPxx5010 series piezoresistive transducers are state-of-the-art monolithic silicon pressure sensors designed for a wide range of applications, but particularly those employing a microcontroller or microprocessor with A/D inputs. This transducer combines advanced micromachining techniques, thin-film metallization, and bipolar processing to provide an accurate, high level analog output signal that is proportional to the applied pressure. The axial port has been modified to accommodate industrial grade tubing.

### Features

- 5.0% Maximum Error over 0° to 85°C
- · Ideally Suited for Microprocessor or Microcontroller-Based Systems
- Durable Epoxy Unibody and Thermoplastic (PPS) Surface Mount Package
- Temperature Compensated over -40° to +125°C
- · Patented Silicon Shear Stress Strain Gauge
- · Available in Differential and Gauge Configurations
- · Available in Surface Mount (SMT) or Through-hole (DIP) Configurations

## MPX5010 MPXV5010 MPVZ5010 Series

0 to 10 kPa (0 to 1.45 psi) (0 to 1019.78 mm H<sub>2</sub>O) 0.2 to 4.7 V Output

### Application Examples

- Hospital Beds
- HVAC
- Respiratory Systems
- Process Control
- Washing Machine Water Level Measurement (Reference AN1950)
- Ideally Suited for Microprocessor or Microcontroller-Based Systems
- Appliance Liquid Level and Pressure Measurement

## **Operating Characteristics**

**Table 1. Operating Characteristics** ( $V_S = 5.0 \text{ Vdc}$ ,  $T_A = 25^{\circ}\text{C}$  unless otherwise noted, P1 > P2. Decoupling circuit shown in Figure 3 required to meet specification.)

Characteristic		Symbol	Min	Тур	Мах	Unit
Pressure Range		P <sub>OP</sub>	0	_	10 1019.78	kPa mm H <sub>2</sub> O
Supply Voltage <sup>(1)</sup>		V <sub>S</sub>	4.75	5.0	5.25	Vdc
Supply Current		Ι <sub>ο</sub>		5.0	10	mAdc
Minimum Pressure Offset <sup>(2)</sup> @ $V_S = 5.0$ Volts	(0 to 85°C)	V <sub>off</sub>	0	0.2	0.425	Vdc
Full Scale Output <sup>(3)</sup> @ V <sub>S</sub> = 5.0 Volts	(0 to 85°C)	V <sub>FSO</sub>	4.475	4.7	4.925	Vdc
Full Scale Span <sup>(4)</sup> @ V <sub>S</sub> = 5.0 Volts	(0 to 85°C)	V <sub>FSS</sub>	4.275	4.5	4.725	Vdc
Accuracy <sup>(5)</sup>	(0 to 85°C)	—	_	—	±5.0	%V <sub>FSS</sub>
Sensitivity		V/P	_	450 4.413	—	mV/mm mV/mm H <sub>2</sub> O
Response Time <sup>(6)</sup>		t <sub>R</sub>		1.0	_	ms
Output Source Current at Full Scale Output		I <sub>O+</sub>	_	0.1	—	mAdc
Warm-Up Time <sup>(7)</sup>		_	_	20	—	ms
Offset Stability <sup>(8)</sup>		_	_	±0.5	—	%V <sub>FSS</sub>

1. Device is ratiometric within this specified excitation range.

2. Offset (Voff) is defined as the output voltage at the minimum rated pressure.

- 3. Full Scale Output (V<sub>FSO</sub>) is defined as the output voltage at the maximum or full rated pressure.
- 4. Full Scale Span (V<sub>FSS</sub>) is defined as the algebraic difference between the output voltage at full rated pressure and the output voltage at the minimum rated pressure.
- 5. Accuracy (error budget) consists of the following:

Linearity: Output deviation from a straight line relationship with pressure over the specified pressure range.

Temperature Hysteresis:Output deviation at any temperature within the operating temperature range, after the temperature is cycled to and from the minimum or maximum operating temperature points, with zero differential pressure applied.

Pressure Hysteresis:Output deviation at any pressure within the specified range, when this pressure is cycled to and from the minimum or maximum rated pressure, at 25°C.

TcSpan: Output deviation over the temperature range of 0° to 85°C, relative to 25°C.

TcOffset:Output deviation with minimum rated pressure applied, over the temperature range of 0° to 85°C, relative to 25°C.

Variation from Nominal:The variation from nominal values, for Offset or Full Scale Span, as a percent of V<sub>FSS</sub>, at 25°C.

- 6. Response Time is defined as the time for the incremental change in the output to go from 10% to 90% of its final value when subjected to a specified step change in pressure.
- 7. Warm-up Time is defined as the time required for the product to meet the specified output voltage after the Pressure has been stabilized.
- 8. Offset Stability is the product's output deviation when subjected to 1000 hours of Pulsed Pressure, Temperature Cycling with Bias Test.

### **Maximum Ratings**

### Table 2. Maximum Ratings<sup>(1)</sup>

Rating	Symbol	Value	Unit
Maximum Pressure (P1 > P2)	P <sub>max</sub>	40	kPa
Storage Temperature	T <sub>stg</sub>	-40 to +125	°C
Operating Temperature	T <sub>A</sub>	-40 to +125	°C

1. Exposure beyond the specified limits may cause permanent damage or degradation to the device.

Figure 1 shows a block diagram of the internal circuitry integrated on a pressure sensor chip.

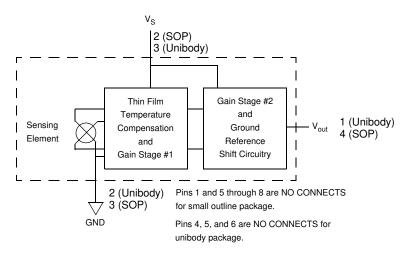

Figure 1. Fully Integrated Pressure Sensor Schematic

**ON-CHIP TEMPERATURE COMPENSATION AND CALIBRATION** 

The performance over temperature is achieved by integrating the shear-stress strain gauge, temperature compensation, calibration and signal conditioning circuitry onto a single monolithic chip.

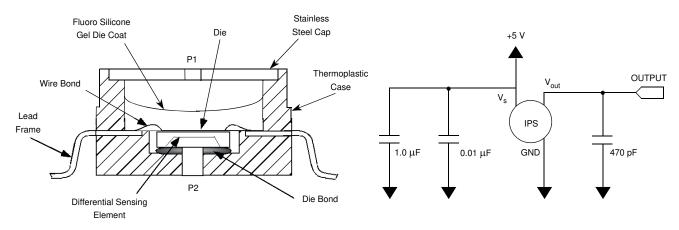

Figure 3 illustrates the Differential or Gauge configuration in the basic chip carrier (Case 482). A fluorosilicone gel isolates the die surface and wire bonds from the environment, while allowing the pressure signal to be transmitted to the sensor diaphragm.

The MPxx5010G series pressure sensor operating characteristics, and internal reliability and qualification tests are based on use of dry air as the pressure media. Media,

other than dry air, may have adverse effects on sensor performance and long-term reliability. Contact the factory for information regarding media compatibility in your application.

Figure 4 shows the recommended decoupling circuit for interfacing the integrated sensor to the A/D input of a microprocessor or microcontroller. Proper decoupling of the power supply is recommended.

Figure 5 shows the sensor output signal relative to pressure input. Typical, minimum, and maximum output curves are shown for operation over a temperature range of 0° to 85°C using the decoupling circuit shown in Figure 4. The output will saturate outside of the specified pressure range.

Figure 3. Recommended Power Supply Decoupling and Output Filtering (For additional output filtering, please refer to Application Note AN1646.)

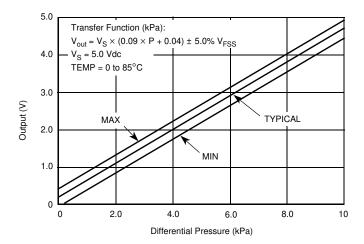

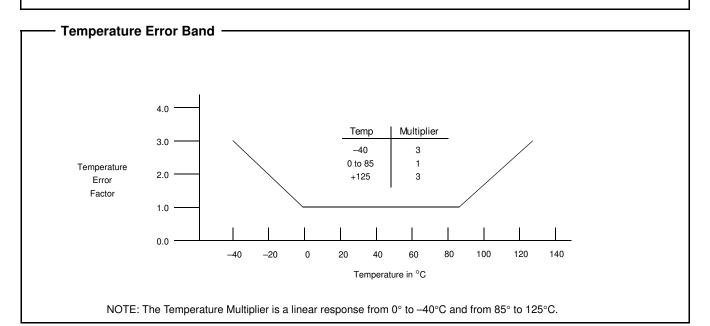

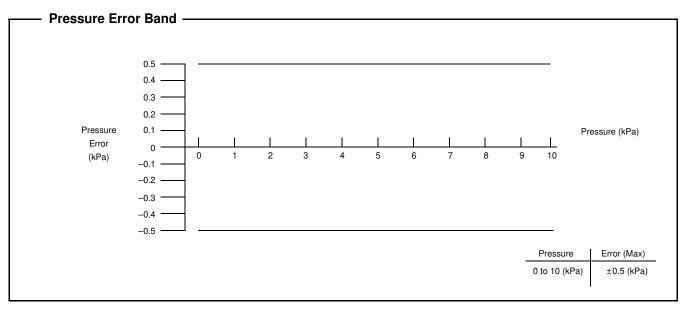

Figure 4. Output vs. Pressure Differential

### Transfer Function

```
 \begin{array}{ll} \mbox{Nominal Transfer Value:} & \mbox{V}_{out} = \mbox{V}_S \ x \ (0.09 \ x \ \mbox{P} \ + \ 0.04) \\ & \pm \ (\mbox{Pressure Error} \ x \ \mbox{Temp. Factor} \ x \ 0.09 \ x \ \mbox{V}_S) \\ & \mbox{V}_S = 5.0 \ \mbox{V} \ \pm \ 0.25 \ \mbox{Vdc} \end{array}
```

### PRESSURE (P1)/VACUUM (P2) SIDE IDENTIFICATION TABLE

Freescale designates the two sides of the pressure sensor as the Pressure (P1) side and the Vacuum (P2) side. The Pressure (P1) side is the side containing fluorosilicone gel which protects the die from harsh media. The MPX pressure sensor is designed to operate with positive differential pressure applied, P1 > P2.

The Pressure (P1) side may be identified by using the table below:

Part Number	Case Type	Pressure (P1) Side Identifier
MPX5010DP	867C	Side with Part Marking
MPX5010GP	867B	Side with Port Attached
MPX5010GS	867E	Side with Port Attached
MPX5010GSX	867F	Side with Port Attached
MPXV5010G6U	482	Stainless Steel Cap
MPXV5010GC6U/6T1	482A	Side with Port Attached
MPXV5010GC7U	482C	Side with Port Attached
MPXV5010GP	1369	Side with Port Attached
MPXV5010DP	1351	Side with Part Marking
MPVZ5010G6U	482	Stainless Steel Cap
MPVZ5010G7U	482B	Stainless Steel Cap
MPVZ5010GW6U	1735	Vertical Port Attached
MPVZ5010GW7U	1560	Vertical Port Attached

### MINIMUM RECOMMENDED FOOTPRINT FOR SURFACE MOUNTED APPLICATIONS

Surface mount board layout is a critical portion of the total design. The footprint for the surface mount packages must be the correct size to ensure proper solder connection interface between the board and the package. With the correct

footprint, the packages will self align when subjected to a solder reflow process. It is always recommended to design boards with a solder mask layer to avoid bridging and shorting between solder pads.

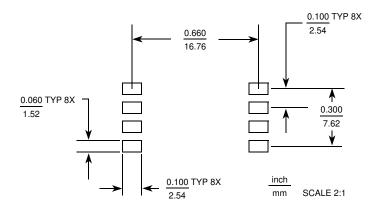

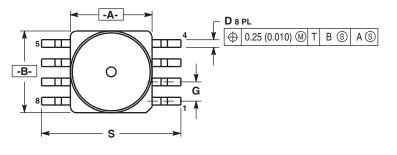

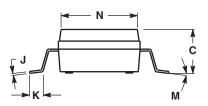

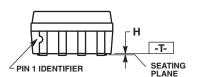

Figure 5. SOP Footprint (Case 482)
