## Detailed Description

The MAX4714 is a low-on-resistance ( $R_{ON}$ ), low-voltage, single-pole/double-throw (SPDT) analog switch that operates from a +1.6V to +3.6V supply. The MAX4714 has break-before-make switching. This device also has fast switching speeds ( $t_{ON} = 18\text{ns}$ , max,  $t_{OFF} = 12\text{ns}$ , max).

When powered from a +3V supply, the 0.8Ω (max)  $R_{ON}$  allows high continuous currents to be switched in a variety of applications.

## Applications Information

### Logic Inputs

The MAX4714 logic input can be driven up to +3.6V regardless of the supply voltage. For example, with a

+3.3V supply, IN may be driven low to GND and high to +3.6V. Driving IN rail-to-rail minimizes power consumption.

### Analog Signal Levels

Analog signals that range over the entire supply voltage ( $V+$  to GND) can be passed with very little change in on-resistance (see *Typical Operating Characteristics*). The switches are bidirectional, so the NO, NC, and COM pins can be used as either inputs or outputs.
