

FEATURES

- Conversion gain: 18 dB typical
- Sideband rejection: 30 dBc typical
- Input power for 1 dB compression (P1dB): 2 dBm typical
- Output third-order intercept (OIP3): 33 dBm typical
- 2× local oscillator (LO) leakage at RFOUT: 10 dBm typical
- 2× LO leakage at the IF input: -25 dBm typical
- RF return loss: 13 dB typical
- LO return loss: 10 dB typical
- 32-lead, 5 mm × 5 mm LFCSP package

APPLICATIONS

- Point to point and point to multipoint radios
- Military radars, electronic warfare (EW), and electronic intelligence (ELINT)
- Satellite communications
- Sensors

GENERAL DESCRIPTION

The **HMC7911** is a compact gallium arsenide (GaAs), pseudo-morphic (pHEMT), monolithic microwave integrated circuit (MMIC) upconverter in a RoHS compliant, low stress, injection molded plastic LFCSP package that operates from 17 GHz to 20 GHz. This device provides a small signal conversion gain of 18 dB with 30 dBc of sideband rejection. The **HMC7911** uses a variable gain amplifier preceded by an in-phase/quadrature (I/Q) mixer that is driven by an active 2× local oscillator (LO) multiplier. IF1 and IF2 mixer inputs are provided, and an external 90° hybrid is needed to select the required sideband. The I/Q mixer topology reduces the need for filtering of the unwanted sideband. The **HMC7911** is a much smaller alternative to hybrid style single sideband (SSB) upconverter assemblies, and it eliminates the need for wire bonding by allowing the use of surface-mount manufacturing techniques.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Drain Bias Voltage $V_{DRFX}, V_{DLOX}, V_{REF}, V_{DET}$	5.5 V
Gate Bias Voltage V_{GRF}	-3 V to 0 V
V_{CTLX}, V_{ESD}	-7 V to 0 V
V_{GMIX}	-2 V to 0 V
LO Input Power	10 dBm
IF Input Power	10 dBm
Maximum Junction Temperature	175°C
Storage Temperature Range	-65°C to +150°C
Operating Temperature Range	-40°C to +85°C
Reflow Temperature	260°C
ESD Sensitivity (HBM)	250 V (Class 1A)

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages. The θ_{JA} values in Table 3 assume a 4-layer JEDEC standard board with zero airflow.

Table 3. Thermal Resistance

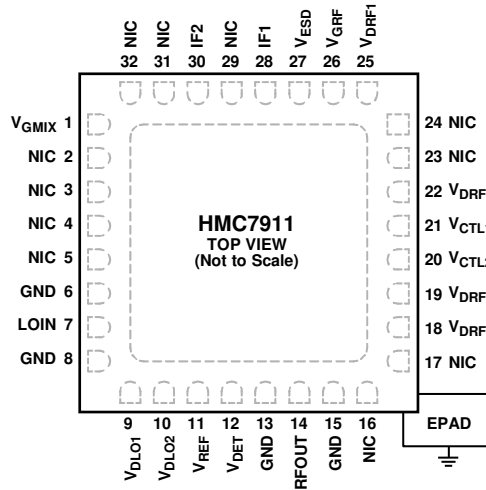

Package Type	θ_{JA}	θ_{JC}	Unit
32-Lead LFCSP	31.66	24.3	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES
 1. NIC = NOT INTERNALLY CONNECTED. NO CONNECTION IS REQUIRED. THESE PINS ARE NOT CONNECTED INTERNALLY. HOWEVER, ALL DATA SHOWN HEREIN WERE MEASURED WITH THESE PINS CONNECTED EXTERNALLY TO RF/DC GROUND.
 2. EXPOSED PAD. CONNECT TO A LOW IMPEDANCE THERMAL AND ELECTRICAL GROUND PLANE.

13730-002

Figure 2. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	V _{GMIX}	Gate Voltage for FET Mixer. See Figure 3. Refer to the typical application circuit for the required external components (see Figure 83).
2, 3, 4, 5, 16, 17, 23, 24, 29, 31, 32	NIC	Not Internally Connected. No connection is required. These pins are not connected internally. However, all data shown herein were measured with these pins connected externally to RF/dc ground.
6, 8, 13, 15	GND	Ground Connect. See Figure 4. These pins and package bottom must be connected to RF/dc ground.
7	LOIN	Local Oscillator Input. See Figure 5. This pin is dc-coupled and matched to 50 Ω.
9, 10	V _{DLO1} , V _{DLO2}	Power Supply Voltage for LO Amplifier. See Figure 6. Refer to the typical application circuit for the required external components (see Figure 83).
11	V _{REF}	Reference Voltage for the Power Detector. See Figure 7. V _{REF} is the dc bias of the diode biased through the external resistor used for temperature compensation of V _{DET} . Refer to the typical application circuit for the required external components (see Figure 83).
12	V _{DET}	Detector Voltage for the Power Detector. See Figure 8. V _{DET} is the dc voltage representing the RF output power rectified by diode, which is biased through an external resistor. Refer to the typical application circuit for the required external components (see Figure 83).
14	RFOUT	Radio Frequency Output. See Figure 9. This pin is dc-coupled and matched to 50 Ω.
18, 19, 22, 25	V _{DRF4} , V _{DRF3} , V _{DRF2} , V _{DRF1}	Power Supply Voltage for the Variable Gain Amplifier. See Figure 10. Refer to the typical application circuit for the required external components (see Figure 83).
20, 21	V _{CTL2} , V _{CTL1}	Gain Control Voltage for the Variable Gain Amplifier. See Figure 11. Refer to the typical application circuit for the required external components (see Figure 83).
26	V _{GRF}	Gate Voltage for the Variable Gain Amplifier. See Figure 12. Refer to the typical application circuit for the required external components (see Figure 83).
27	V _{ESD}	DC Voltage for ESD Protection. See Figure 13. Refer to the typical application circuit for the required external components (see Figure 83).
28, 30	IF1, IF2	Quadrature IF Inputs. See Figure 14. For applications not requiring operation to dc, use an off chip dc blocking capacitor. For operation to dc, these pins must not source/sink more than ±3 mA of current or device malfunction and failure may result.
	EPAD	Exposed Pad. Connect to a low impedance thermal and electrical ground plane.

THEORY OF OPERATION

The HMC7911 is a GaAs, pHEMT, MMIC I/Q upconverter with an integrated LO buffer that upconverts intermediate frequencies between dc to 3.5 GHz to RF between 17 GHz and 20 GHz. LO buffer amplifiers are included on chip to allow a minimum LO drive level of 4 dBm for full performance. The LO path feeds a quadrature splitter followed by on-chip baluns that drive the I and Q singly balanced cores of the passive mixers. The RF output of the I and Q mixers are then summed through

an on-chip Wilkinson power combiner and relatively matched to provide a single-ended 50 Ω output signal that is amplified by the RF amplifiers to produce a dc-coupled and 50 Ω matched RF output signal at the RFOUT port. A voltage attenuator precedes the RF amplifiers for desired gain control.

The power detector feature provides a LO cancellation capability to the level of -10 dBm. See Figure 82 for a functional block diagram of the upconverter circuit architecture.

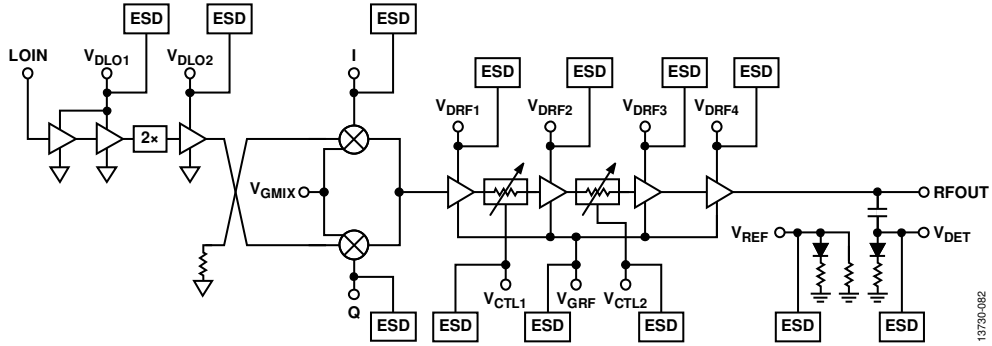

Figure 82. Upconverter Circuit Architecture

13730-082

APPLICATIONS INFORMATION

A typical lower sideband upconversion circuit is shown in Figure 83. The lower sideband input signal is connected to the input port of the 90° hybrid coupler. The isolated port is loaded to 50 Ω. The external 90° hybrid splits the IF signal into I and Q phase terms. The I and Q input signals enter the HMC7911 on the IF1 and IF2 inputs. IF1 of the device is connected to the 90° port of the hybrid coupler. IF2 is connected to the 0° port of the hybrid coupler. The LO to RF leakage can be improved by applying small dc offsets to the I/Q mixer cores via the V_{DC_IF1} and V_{DC_IF2} inputs. However, it is important to limit the applied dc bias to avoid sourcing or sinking more than ±3 mA of bias current. Depending on the bias sources used, it may be prudent to add series resistance to ensure that the applied bias current does not exceed ±3 mA.

BIASING SEQUENCE

The HMC7911 uses buffer amplifiers in the LO and RF paths. These active stages all use depletion mode pHEMTs. To ensure transistor damage does not occur, use the following power-up bias sequence:

1. Apply a -5 V bias to Pin 27 (V_{ESD}).
2. Apply a -2 V bias to Pin 26 (V_{GRF}), which is a pinched off state.
3. Apply a -0.5 V bias to Pin 1 (V_{GMIX}). This bias can be adjusted from -0.5 V to -1 V depending on the LO power used to provide the optimum IP3 response of the mixer.
4. Apply 5 V to Pin 9 (V_{DLO1}) and Pin 10 (V_{DLO2}).
5. Apply -5 V to Pin 20 (V_{CTL2}) and Pin 21 (V_{CTL1}). Adjust V_{CTL1} and V_{CTL2} between -5 V and 0 V depending on the amount of attenuation desired.
6. Apply 5 V to Pin 18, Pin 19, Pin 22, and Pin 25 (V_{DRF4} , V_{DRF3} , V_{DRF2} , and V_{DRF1}).
7. Adjust Pin 26 (V_{GRF}) between -2 V and 0 V to achieve a total amplifier quiescent drain current of 220 mA.

LOCAL OSCILLATOR NULLING

Broad LO nulling may be required to achieve optimum IP3 and LO to RF isolation performance. This nulling is achieved by applying dc voltages between -0.2 V and +0.2 V to the I and Q ports to suppress the LO signal across the RF frequency band by approximately 5 dBc to 10 dBc. To suppress the LO signal at the RF port, use the following nulling sequence:

1. Adjust V_{DC_IF1} between -0.2 V and +0.2 V and monitor the LO leakage on the RF port. When the desired or maximum level of suppression is achieved, proceed to Step 2.
2. Adjust V_{DC_IF2} between -0.2 V and +0.2 V and monitor the LO leakage on the RF port until either the desired or the maximum level of suppression is achieved.
3. If the desired level of the LO signal on the RF port has still not been achieved, further tune each V_{DC_IF1} and V_{DC_IF2} independently to achieve the desired LO leakage. The resolution of the voltage changed on the voltage of the V_{DC_IF1} and V_{DC_IF2} inputs must be in the millivolt range.

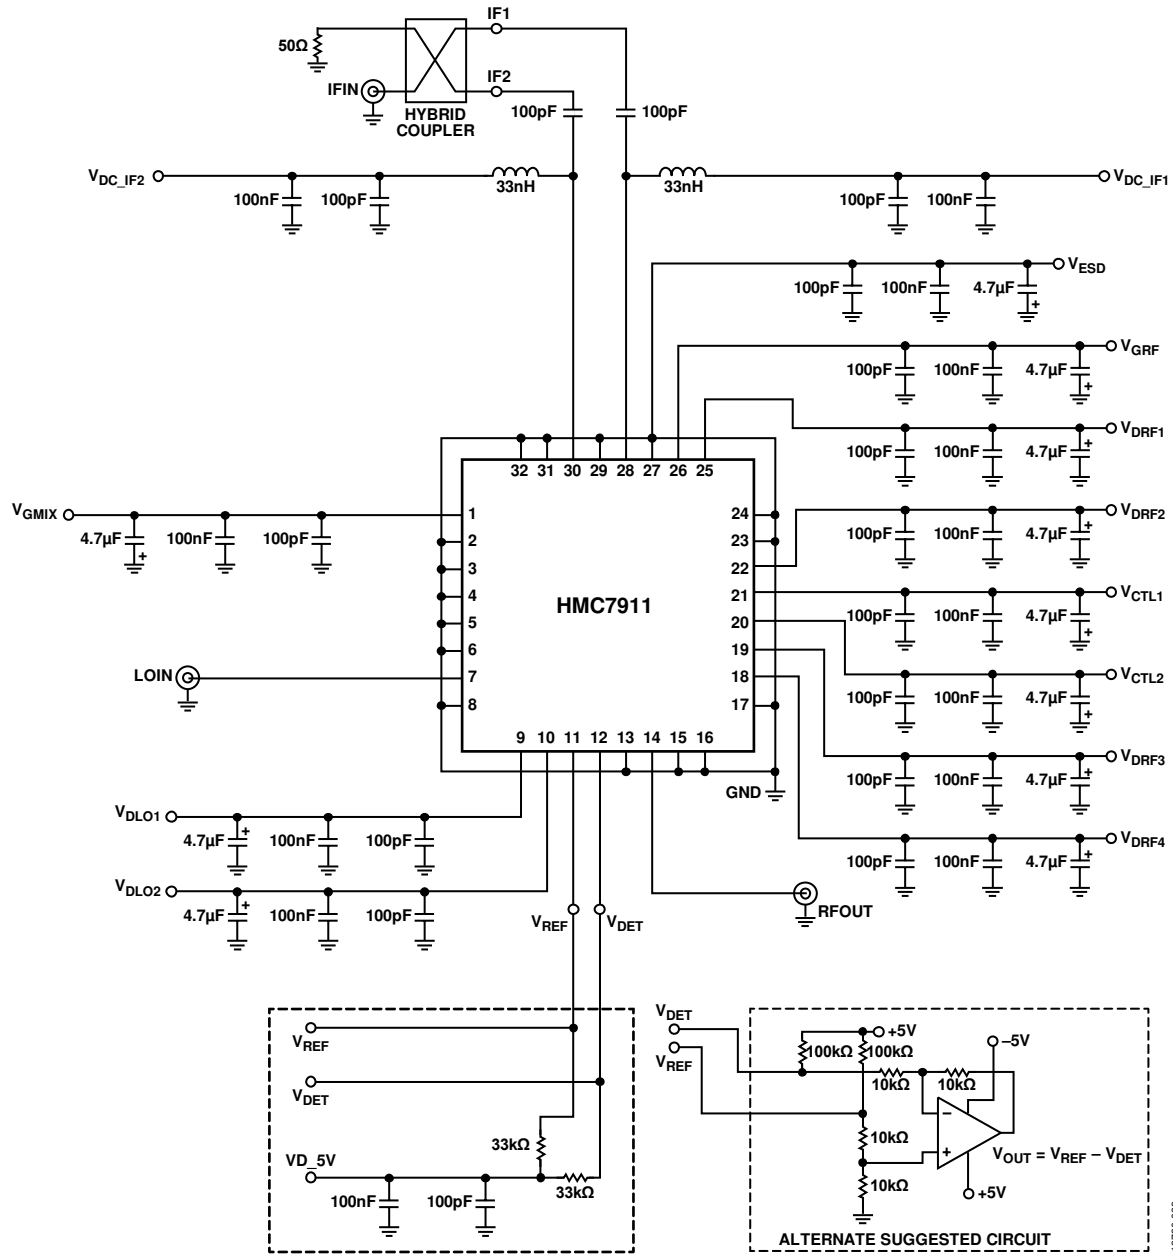

Figure 83. Typical Application Circuit

13730-083

EVALUATION PRINTED CIRCUIT BOARD

The circuit board used in this application must use RF circuit design techniques. Signal lines must have 50 Ω impedance and the package ground leads and exposed pad must be connected directly to the ground plane similar to that shown in Figure 84.

Use a sufficient number of via holes to connect the top and bottom ground planes. The evaluation circuit board shown in Figure 84 is available from Analog Devices, Inc., upon request.
