

SM470R1B1M-HT 16-/32-Bit RISC Flash Microcontroller

1 Device Overview

1.1 Features

- High-Performance Static CMOS Technology
 - SM470R1x 16-/32-Bit RISC Core (ARM7TDMI™)
 - 60-MHz System Clock (Pipeline Mode)
 - Independent 16-/32-Bit Instruction Set
 - Open Architecture With Third-Party Support
 - Built-In Debug Module
 - Integrated Memory
 - 1MB Program Flash
 - Two Banks With 16 Contiguous Sectors
 - 64KB Static RAM (SRAM)
 - Memory Security Module (MSM)
 - JTAG Security Module
 - Operating Features
 - Low-Power Modes: STANDBY and HALT
 - Industrial Temperature Range
 - 470+ System Module
 - 32-Bit Address Space Decoding
 - Bus Supervision for Memory/Peripherals
 - Digital Watchdog (DWD) Timer
 - Analog Watchdog (AWD) Timer
 - Enhanced Real-Time Interrupt (RTI)
 - Interrupt Expansion Module (IEM)
 - System Integrity and Failure Detection
 - ICE Breaker
 - Direct Memory Access (DMA) Controller
 - 32 Control Packets and 16 Channels
 - Zero-Pin Phase-Locked Loop (ZPLL)-Based Clock Module With Prescaler
 - Multiply-by-4 or -8 Internal ZPLL Option
 - ZPLL Bypass Mode
 - Twelve Communication Interfaces:
 - Two Serial Peripheral Interfaces (SPIs)
 - 255 Programmable Baud Rates
 - Three Serial Communication Interfaces (SCIs)
 - 2²⁴ Selectable Baud Rates
 - Asynchronous/Isosynchronous Modes
 - Two High-End CAN Controllers (HECC)
 - 32-Mailbox Capacity
 - Fully Compliant With CAN Protocol, Version 2.0B
 - Five Inter-Integrated Circuit (I²C) Modules
 - Multi-Master and Slave Interfaces
 - Up to 400 Kbps (Fast Mode)
 - 7- and 10-Bit Address Capability
 - High-End Timer Lite (HET)
 - 12 Programmable I/O Channels:
 - 12 High-Resolution Pins
 - High-Resolution Share Feature (XOR)
 - High-End Timer RAM
 - 64-Instruction Capacity
 - External Clock Prescale (ECP) Module
 - Programmable Low-Frequency External Clock (CLK)
 - 12-Channel, 10-Bit Multi-Buffered ADC (MibADC)
 - 64-Word FIFO Buffer
 - Single- or Continuous-Conversion Modes
 - 1.55- μ s Minimum Sample and Conversion Time
 - Calibration Mode and Self-Test Features
 - Flexible Interrupt Handling
 - Expansion Bus Module (EBM)
 - Supports 8- and 16-Bit Expansion Bus Memory Interface Mappings
 - 42 I/O Expansion Bus Pins
 - 46 Dedicated General-Purpose I/O (GIO) Pins and 47 Additional Peripheral I/Os
 - Sixteen External Interrupts
 - On-Chip Scan-Base Emulation Logic, IEEE Standard 1149.1 ⁽¹⁾ (JTAG) Test-Access Port
 - Available in KGD, HFQ, HKP, and PGE Packages
- (1) The test-access port is compatible with the IEEE Standard 1149.1-1990, IEEE Standard Test-Access Port and Boundary Scan Architecture specification. Boundary scan is not supported on this device.

1.2 Applications

- Supports Extreme Temperature Applications:
 - Controlled Baseline
 - One Assembly/Test Site
 - One Fabrication Site
 - Available in Extreme (–55°C to 220°C) Temperature Range ⁽²⁾
 - Extended Product Life Cycle
 - Extended Product-Change Notification
 - Product Traceability
 - Texas Instruments' high temperature products use highly optimized silicon (die) solutions with design and process enhancements to maximize performance over extended temperatures.

1.3 Description

The SM470R1B1M ⁽³⁾ devices are members of the Texas Instruments SM470R1x family of general-purpose 16-/32-bit reduced instruction set computer (RISC) microcontrollers. The B1M microcontroller offers high performance using the high-speed ARM7TDMI 16-/32-bit RISC central processing unit (CPU), resulting in a high instruction throughput while maintaining greater code efficiency. The ARM7TDMI 16-/32-bit RISC CPU views memory as a linear collection of bytes numbered upwards from zero. The SM470R1B1M uses the big-endian format where the most significant byte of a word is stored at the lowest numbered byte and the least significant byte of a word is stored at the highest numbered byte.

High-end embedded control applications demand more performance from their controllers while maintaining low costs. The B1M RISC core architecture offers solutions to these performance and cost demands while maintaining low power consumption.

The B1M devices contain the following:

- ARM7TDMI 16-/32-bit RISC CPU
- SM470R1x system module (SYS) with 470+ enhancements
- 1MB flash
- 64KB SRAM
- ZPLL clock module
- DWD timer
- AWD timer
- Enhanced RTI module
- IEM
- MSM
- JTAG security module
- Two SPI modules
- Three SCI modules
- Two HECC
- Five I²C modules
- 10-bit MibADC, with 12 input channels
- HET controlling 12 I/Os
- ECP

(3) Throughout the remainder of this document, the SM470R1B1M will be referred to as either the full device name or as B1M.

- EBM
- Up to 93 I/O pins

The functions performed by the 470+ system module (SYS) include:

- Address decoding
- Memory protection
- Memory and peripherals bus supervision
- Reset and abort exception management
- Prioritization for all internal interrupt sources
- Device clock control
- Parallel signature analysis (PSA)

The enhanced RTI module on the B1M has the option to be driven by the oscillator clock. The DWD is a 25-bit resettable decremting counter that provides a system reset when the watchdog counter expires. This data sheet includes device-specific information such as memory and peripheral select assignment, interrupt priority, and a device memory map. For a more detailed functional description of the SYS module, see the *TMS470R1x System Module Reference Guide* ([SPNU189](#)).

The B1M memory includes general-purpose SRAM supporting single-cycle read/write accesses in byte, half-word, and word modes.

The flash memory on this device is a nonvolatile, electrically erasable, and programmable memory implemented with a 32-bit-wide data bus interface. The flash operates with a system clock frequency of up to 24 MHz or 30 MHz, depending on the input voltage. When in pipeline mode, the flash operates with a system clock frequency of up to 48 MHz or 60 MHz, depending on the input voltage. For more detailed information on the flash, see [Section 8.2.1.4](#).

The MSM and the JTAG security module prevent unauthorized access and visibility to on-chip memory, thereby preventing reverse engineering or manipulation of proprietary code.

The B1M device has twelve communication interfaces: two SPIs, three SCIs, two HECCs, and five I²Cs. The SPI provides a convenient method of serial interaction for high-speed communications between similar shift-register type devices. The SCI is a full-duplex, serial I/O interface intended for asynchronous communication between the CPU and other peripherals using the standard non-return-to-zero (NRZ) format. The HECC uses a serial, multimaster communication protocol that efficiently supports distributed realtime control with robust communication rates of up to 1 Mbps. These CAN peripherals are ideal for applications operating in noisy and harsh environments (for example, industrial fields) that require reliable serial communication or multiplexed wiring. The I²C module is a multimaster communication module providing an interface between the B1M microcontroller and an I²C-compatible device through the I²C serial bus. The I²C supports both 100 Kbps and 400 Kbps speeds. For more detailed functional information on the SPI, SCI, and CAN peripherals, see the specific reference guides ([SPNU195](#), [SPNU196](#), and [SPNU197](#)). For more detailed functional information on the I²C, see the *TMS470R1x Inter-Integrated Circuit (I²C) Reference Guide* ([SPNU223](#)).

The HET is an advanced intelligent timer that provides sophisticated timing functions for realtime applications. The timer is software-controlled, using a reduced instruction set, with a specialized timer micromachine and an attached I/O port. The HET can be used for compare, capture, or general-purpose I/O. It is especially well-suited for applications requiring multiple sensor information and drive actuators with complex and accurate time pulses. The HET used in this device is the high-end timer lite. It has fewer I/Os than the usual 32 in a standard HET. For more detailed functional information on the HET, see the *TMS470R1x High-End Timer (HET) Reference Guide* ([SPNU199](#)).

The B1M HET peripheral contains the XOR-share feature. This feature allows two adjacent HET high-resolution channels to be XORed together, making it possible to output smaller pulses than a standard HET. For more detailed information on the HET XOR-share feature, see the *TMS470R1x High-End Timer (HET) Reference Guide* ([SPNU199](#)).

The B1M device has one 10-bit-resolution, sample-and-hold MibADC. Each of the MibADC channels can be converted individually or can be grouped by software for sequential conversion sequences. There are three separate groupings, two of which can be triggered by an external event. Each sequence can be converted once when triggered or configured for continuous conversion mode. For more detailed functional information on the MibADC, see the *TMS470R1x Multi-Buffered Analog-to-Digital Converter (MibADC) Reference Guide* ([SPNU206](#)).

The ZPLL clock module contains a phase-locked loop, a clock-monitor circuit, a clock-enable circuit, and a prescaler (with prescale values of 1 to 8). The function of the ZPLL is to multiply the external frequency reference to a higher frequency for internal use. The ZPLL provides ACLK to the system (SYS) module. The SYS module subsequently provides system clock (SYSCLK), realtime interrupt clock (RTICK), CPU clock (MCLK), and peripheral interface clock (ICLK) to all other B1M device modules. For more detailed functional information on the ZPLL, see the *TMS470R1x Zero-Pin Phase-Locked Loop (ZPLL) Clock Module Reference Guide* ([SPNU212](#)).

NOTE

ACLK should not be confused with the MibADC internal clock, ADCLK. ACLK is the continuous system clock from an external resonator/crystal reference.

The EBM is a standalone module that supports the multiplexing of the GIO functions and the expansion bus interface. For more information on the EBM, see the *TMS470R1x Expansion Bus Module (EBM) Reference Guide* ([SPNU222](#)).

The B1M device also has an external clock prescaler (ECP) module that when enabled, outputs a continuous external clock (ECLK) on a specified GIO pin. The ECLK frequency is a user-programmable ratio of the peripheral interface clock (ICLK) frequency. For more detailed functional information on the ECP, see the *TMS470R1x External Clock Prescaler (ECP) Reference Guide* ([SPNU202](#)).

3 Device Characteristics

| CHARACTERISTICS ⁽¹⁾ | DEVICE DESCRIPTION SM470R1B1M | COMMENTS |
|---|--|---|
| MEMORY | | |
| For the number of memory selects on this device, see Table 8-5, SM470R1B1M Memory Selection Assignment . | | |
| INTERNAL MEMORY | Pipeline/non-pipeline 1MB flash 64KB SRAM MSM JTAG security module | Flash is pipeline-capable. The B1M RAM is implemented in one 64K array selected by two memory-select signals (see Table 8-5, SM470R1B1M Memory Selection Assignment). |
| PERIPHERALS | | |
| For the device-specific interrupt priority configurations, see Table 8-2, Interrupt Priority . And for the 1K peripheral address ranges and their peripheral selects, see Table 8-7, B1M Peripherals, System Module, and Flash Base Addresses . | | |
| CLOCK | ZPLL | Zero-pin PLL has no external loop filter pins. |
| Expansion bus | EBM | Expansion bus module with 42 pins. Supports 8- and 16-bit memories. See Table 8-3 for details. |
| GENERAL-PURPOSE I/Os | 46 I/O | Port A has 8 external pins. Port B has only 1 external pin. Port C has 5 external pins. Port D has 6 external pins. Ports E, F, and G each have 8 external pins. Port H has 2 external pins. |
| ECP | Yes | |
| SCI | 3 (3 pin) | |
| CAN (HECC and/or SCC) | 2 HECC | Two HECC |
| SPI (5-pin, 4-pin, or 3-pin) | 2 (5 pin) | |
| I ² C | 5 | |
| HET with XOR share | 12 I/O | The high-resolution (HR) SHARE feature allows even-numbered HR pins to share the next higher odd-numbered HR pin structures. This HR sharing is independent of whether or not the odd pin is available externally. If an odd pin is available externally and <i>shared</i> , then the odd pin can only be used as a general-purpose I/O. For more information on HR SHARE, see the <i>TMS470R1x High-End Timer (HET) Reference Guide</i> (SPNU199). |
| HET RAM | 64-instruction capacity | |
| MibADC | 10-bit, 12-channel 64-word FIFO | Both the logic and registers for a full 16-channel MibADC are present. |
| CORE VOLTAGE | 1.8 V | |
| I/O VOLTAGE | 3.3 V | |
| PINS | 84 or 144 | |
| PACKAGES | HFQ, HKP, or PGE | |

5.1 Features

The reduced pin count version of SM470R1B1M has the following features.

- Communication interfaces
 - Two SPIs
 - Two SCIs
 - Two HECC
 - Two I²C modules
- 4-channel, 10-bit MibADC

- High-end timer lite (HET) controlling seven programmable I/O channels
- Eight general-purpose I/Os

5.2 Pin Functions (HFQ/HKP Package)

| PIN | | | TYPE ^{(1) (2)} | CURRENT OUTPUT | INTERNAL PULLUP/PULLDOWN ⁽³⁾ | DESCRIPTION |

| NAME | PAD NO. | HFQ/HKP ⁽⁴⁾ | | | | |
| HIGH-END TIMER (HET) | | | | | | |
| HET[0] | 76 | 42 | 3.3 V | 2 mA -z | IPD (20 μ A) | Timer input capture or output compare. The HET[8:0,18,20,22] applicable pins can be programmed as general-purpose input/output (GIO) pins. All are high-resolution pins. The high-resolution (HR) SHARE feature allows even HR pins to share the next higher odd HR pin structures. This HR sharing is independent of whether or not the odd pin is available externally. If an odd pin is available externally and shared, then the odd pin can only be used as a general-purpose I/O. For more information on HR SHARE, see the <i>TMS470R1x High-End Timer (HET) Reference Guide (SPNU199)</i> . |

(1) PWR = power, GND = ground, REF = reference voltage, NC = no connect

(2) All I/O pins, except \overline{RST} , are configured as inputs while \overline{PORRST} is low and immediately after \overline{PORRST} goes high.

(3) IPD = internal pulldown, IPU = internal pullup (all internal pullups and pulldowns are active on input pins, independent of the \overline{PORRST} state.)

(4) Any pins marked as NC are physically connected to ground internal to the package. Care must be used to keep these pins in a high impedance input state.

| SYSTEM MODULE (SYS) | | | | | | |
| CLKOUT | 84 | 48 | 3.3 V | 8 mA | | Bidirectional pin. CLKOUT can be programmed as a GIO pin or the output of SYSCLK, ICLK, or MCLK. |
| $\overline{\text{PORRST}}$ | 121 | 68 | 3.3 V | | IPD (20 µA) | Input master chip power-up reset. External V _{CC} monitor circuitry must assert a power-on reset. |
| $\overline{\text{RST}}$ | 124 | 69 | 3.3 V | 4 mA | IPU (20 µA) | Bidirectional reset. The internal circuitry can assert a reset, and an external system reset can assert a device reset. On this pin, the output buffer is implemented as an open drain (drives low only). To ensure an external reset is not arbitrarily generated, TI recommends that an external pullup resistor be connected to this pin. |

| WATCHDOG/REAL-TIME INTERRUPT (WD/RTI) | | | | | | |
| AWD | 39 | 21 | 3.3 V | 8 mA | | Analog watchdog reset. The AWD pin provides a system reset if the WD KEY is not written in time by the system, providing an external RC network circuit is connected. If the user is not using AWD, TI recommends that this pin be connected to ground or pulled down to ground by an external resistor. For more details on the external RC network circuit, see the <i>TMS470R1x System Module Reference Guide</i> (SPNU189). |
| TEST/DEBUG (T/D) | | | | | | |
| TCK | 79 | 45 | 3.3 V | | IPD (20 μ A) | Test clock. TCK controls the test hardware (JTAG). |
| TDI | 77 | 43 | | 8 mA | IPU (20 μ A) | Test data in. TDI inputs serial data to the test instruction register, test data register, and programmable test address (JTAG). |
| TDO | 78 | 44 | | 8 mA | IPD (20 μ A) | Test data out. TDO outputs serial data from the test instruction register, test data register, identification register, and programmable test address (JTAG). |
| TEST | 127 | 72 | 3.3 V | | IPD (20 μ A) | Test enable. Reserved for internal use only. TI recommends that this pin be connected to ground or pulled down to ground by an external resistor. |
| TMS | 18 | 11 | | 8 mA | IPU (20 μ A) | Serial input for controlling the state of the CPU test access port (TAP) controller (JTAG). |
| TMS2 | 17 | 10 | | 8 mA | IPU (20 μ A) | Serial input for controlling the second TAP. TI recommends that this pin be connected to V_{CCIO} or pulled up to V_{CCIO} by an external resistor. |
| $\overline{\text{TRST}}$ | 151 | 84 | | | IPD (20 μ A) | Test hardware reset to TAP1 and TAP2. IEEE Standard 1149-1 (JTAG) Boundary-Scan Logic. TI recommends that this pin be pulled down to ground by an external resistor. |

| HET[0] | 73 | 3.3 V | 2 mA -z | IPD (20 µA) | <p>Timer input capture or output compare. The HET[8:0,18,20,22] applicable pins can be programmed as general-purpose input/output (GIO) pins. All are high-resolution pins.</p> <p>The high-resolution (HR) SHARE feature allows even HR pins to share the next higher odd HR pin structures. This HR sharing is independent of whether or not the odd pin is available externally. If an odd pin is available externally and shared, then the odd pin can only be used as a general-purpose I/O. For more information on HR SHARE, see the <i>TMS470R1x High-End Timer (HET) Reference Guide</i> (SPNU199).</p> |

| STANDARD CAN CONTROLLER (SCC) | | | | | |
| CANSRX | - | 5-V tolerant | 4 mA | | SCC receive pin. The CANSRX signal is only connected to the pad and not to a package pin. For reduced power consumption in low power mode, CANSRX should be driven output LOW. |

(1) PWR = power, GND = ground, REF = reference voltage, NC = no connect

(2) All I/O pins, except RST, are configured as inputs while PORRST is low and immediately after PORRST goes high.

(3) IPD = internal pulldown, IPU = internal pullup (all internal pullups and pulldowns are active on input pins, independent of the PORRST state.)

| $\overline{\text{PORRST}}$ | 118 | 3.3 V | | IPD (20 µA) | Input master chip power-up reset. External V _{CC} monitor circuitry must assert a power-on reset. |
| $\overline{\text{RST}}$ | 121 | 3.3 V | 4 mA | IPU (20 µA) | Bidirectional reset. The internal circuitry can assert a reset, and an external system reset can assert a device reset. On this pin, the output buffer is implemented as an open drain (drives low only). To ensure an external reset is not arbitrarily generated, TI recommends that an external pullup resistor be connected to this pin. |

| PIN | | TYPE ⁽¹⁾ (2) | CURRENT OUTPUT | INTERNAL PULLUP/PULLDOWN ⁽³⁾ | DESCRIPTION |
|--|-----|-------------------------|----------------|---|---|
| NAME | NO. | | | | |
| WATCHDOG/REAL-TIME INTERRUPT (WD/RTI) | | | | | |
| AWD | 36 | 3.3 V | 8 mA | | Analog watchdog reset. The AWD pin provides a system reset if the WD KEY is not written in time by the system, providing an external RC network circuit is connected. If the user is not using AWD, TI recommends that this pin be connected to ground or pulled down to ground by an external resistor. For more details on the external RC network circuit, see the <i>TMS470R1x System Module Reference Guide (SPNU189)</i> . |
| TEST/DEBUG (T/D) | | | | | |
| TCK | 76 | 3.3 V | | IPD (20 μ A) | Test clock. TCK controls the test hardware (JTAG). |
| TDI | 74 | | 8 mA | IPI (20 μ A) | Test data in. TDI inputs serial data to the test instruction register, test data register, and programmable test address (JTAG). |
| TDO | 75 | | 8 mA | IPD (20 μ A) | Test data out. TDO outputs serial data from the test instruction register, test data register, identification register, and programmable test address (JTAG). |
| TEST | 124 | 3.3 V | | IPD (20 μ A) | Test enable. Reserved for internal use only. TI recommends that this pin be connected to ground or pulled down to ground by an external resistor. |
| TMS | 17 | | 8 mA | IPI (20 μ A) | Serial input for controlling the state of the CPU test access port (TAP) controller (JTAG). |
| TMS2 | 16 | | 8 mA | IPI (20 μ A) | Serial input for controlling the second TAP. TI recommends that this pin be connected to V _{CCIO} or pulled up to V _{CCIO} by an external resistor. |
| $\overline{\text{TRST}}$ | 144 | | | IPD (20 μ A) | Test hardware reset to TAP1 and TAP2. IEEE Standard 1149-1 (JTAG) Boundary-Scan Logic. TI recommends that this pin be pulled down to ground by an external resistor. |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to their associated grounds.

6.2 ESD Ratings

| | | VALUE | UNIT |

(1) All voltages are with respect to V_{SS} , except V_{CCAD} , which is with respect to V_{SSAD} .

6.4 Electrical Characteristics

Minimum and maximum parameters are characterized over the operating temperature range unless otherwise noted, but may not be production tested at that temperature. Production test limits with statistical guardbands are used to ensure high temperature performance. ⁽¹⁾

| PARAMETER | | TEST CONDITIONS | MIN | TYP ⁽²⁾ | MAX | UNIT | |

| | Input current (5 V tolerant input pins) | V _I = V _{SS} | -1 | | 1 | μA | |
| | | V _I = V _{CCIO} | 1 | | 5 | | |
| | | V _I = 5 V | 5 | | 25 | | |
| V _I = 5.5 V | | 25 | | 50 | | | |
| I _{OL} | Low-level output current | CLKOUT, AWD, TDI, TDO, TMS, TMS2 | V _{OL} = V _{OL} MAX | | | 8 | mA |
| | | $\overline{\text{RST}}$ | | | | 4 | |
| | | All other 3.3 V I/O ⁽⁷⁾ | | | | 2 | |
| | | 5 V tolerant | | | | 4 | |
| I _{OH} | High-level output current | CLKOUT, TDI, TDO, TMS, TMS2 | V _{OH} = V _{OH} MIN | | | -8 | mA |
| | | $\overline{\text{RST}}$ | | | | -4 | |
| | | All other 3.3 V I/O ⁽⁷⁾ | | | | -2 | |
| | | 5 V tolerant | | | | -4 | |

- (1) Source currents (out of the device) are negative while sink currents (into the device) are positive.
- (2) The typical values indicated in this table are the expected values during operation under normal operating conditions: nominal V_{CC}, V_{CCIO}, or V_{CCAD}, room temperature.
- (3) This does not apply to the $\overline{\text{PORRST}}$ pin. For $\overline{\text{PORRST}}$ exceptions, see the $\overline{\text{RST}}$ and $\overline{\text{PORRST}}$ Timings section.
- (4) These values help to determine the external RC network circuit. For more details, see the *TMS470R1x System Module Reference Guide (SPNU189)*.
- (5) V_{OL} and V_{OH} are linear with respect to the amount of load current (I_{OL}/I_{OH}) applied.
- (6) Parameter does not apply to input-only or output-only pins.
- (7) Some of the 2 mA buffers on this device are zero-dominant buffers, as indicated by a -z in the Output Current column of the Pin Functions table. If two of these buffers are shorted together and one is outputting a low level and the other is outputting a high level, the resulting value will always be low.

6.6 ZPLL and Clock Specifications

Table 6-1. Timing Requirements for ZPLL Circuits Enabled or Disabled⁽¹⁾

| | | MIN | TYP | MAX | UNIT |
|-----------------|-----------------------------------|-----|-----|-----|------|
| $f_{(OSC)}$ | Input clock frequency | 4 | | 10 | MHz |
| $t_{c(O SC)}$ | Cycle time, OSCIN | 100 | | | ns |
| $t_{w(O SCIL)}$ | Pulse duration, OSCIN low | 15 | | | ns |
| $t_{w(O SCIH)}$ | Pulse duration, OSCIN high | 15 | | | ns |
| $f_{(OSCRST)}$ | OSC FAIL frequency ⁽²⁾ | | 53 | | kHz |

(1) Not production tested.

(2) Causes a device reset (specifically a clock reset) by setting the RST OSC FAIL (GLBCTRL.15) and the OSC FAIL flag (GLBSTAT.1) bits equal to 1. For more detailed information on these bits and device resets, see the *TMS470R1x System Module Reference Guide (SPNU189)*.

| PARAMETER | | TEST CONDITIONS ⁽⁵⁾ | MIN | MAX | UNIT |
|-----------------|--|--------------------------------|------|-------------------|------|
| $f_{(SYS)}$ | System clock frequency ⁽⁶⁾ | Pipeline mode enabled | | 60 ⁽⁷⁾ | MHz |
| | | Pipeline mode disabled | | 24 | MHz |
| $f_{(CONFIG)}$ | System clock frequency - flash config mode | | | 24 | MHz |
| $f_{(ICLK)}$ | Interface clock frequency | Pipeline mode enabled | | 30 | MHz |
| | | Pipeline mode disabled | | 24 | MHz |
| $f_{(ECLK)}$ | External clock output frequency for ECP module | Pipeline mode enabled | | 30 | MHz |
| | | Pipeline mode disabled | | 24 | MHz |
| $t_{c(SYS)}$ | Cycle time, system clock | Pipeline mode enabled | 16.7 | | ns |
| | | Pipeline mode disabled | 41.6 | | ns |
| $t_{c(CONFIG)}$ | Cycle time, system clock - flash config mode | | 41.6 | | ns |
| $t_{c(ICLK)}$ | Cycle time, interface clock | Pipeline mode enabled | 33.3 | | ns |
| | | Pipeline mode disabled | 41.6 | | ns |
| $t_{c(ECLK)}$ | Cycle time, ECP module external clock output | Pipeline mode enabled | 33.3 | | ns |
| | | Pipeline mode disabled | 41.6 | | ns |

(1) Not production tested.

(2) $f_{(SYS)} = M \times f_{(OSC)}/R$, where $M = \{8\}$, $R = \{1,2,3,4,5,6,7,8\}$ when PLLDIS = 0. R is the system-clock divider determined by the CLKDIVPRE [2:0] bits in the global control register (GLBCTRL[2:0]) and M is the PLL multiplier determined by the MULT4 bit also in the GLBCTRL register (GLBCTRL.3).

$f_{(SYS)} = f_{(OSC)}/R$, where $R = \{1,2,3,4,5,6,7,8\}$ when PLLDIS = 1.

$f_{(ICLK)} = f_{(SYS)}/X$, where $X = \{1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16\}$. X is the interface clock divider ratio determined by the PCR0[4:1] bits in the SYS module.

(3) $f_{(ECLK)} = f_{(ICLK)}/N$, where $N = \{1 \text{ to } 256\}$. N is the ECP prescale value defined by the ECPCTRL[7:0] register bits in the ECP module.

(4) Only ZPLL mode is available. FM mode must not be turned on.

(5) Pipeline mode enabled or disabled is determined by the ENPIPE bit (FMREGOPT.0).

(6) Flash Vread must be set to 5 V to achieve maximum system clock frequency.

(7) Operating V_{CC} range for this system clock frequency is 1.81 to 2.05 V.

- (1) Not production tested.
- (2) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (3) The maximum t_{h(SDA-SCLL)} for I2C bus devices needs to be met only if the device does not stretch the low period (t_{w(SCLL)}) of the SCL signal.
- (4) C_b = The total capacitance of one bus line in pF. If mixed with HS=mode devices, faster fall-times are allowed.

- A. A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- B. The maximum t_{h(SDA-SCLL)} needs only be met if the device does not stretch the LOW period (t_{w(SCLL)}) of the SCL signal.
- C. A fast-mode I2C-bus device can be used in a standard-mode I2C-bus system, but the requirement t_{su(SDA-SCLH)} ≥ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t_{r max} + t_{su(SDA-SCLH)}.
- D. C_b = total capacitance of one bus line in pF. If mixed with HS=mode devices, faster fall-times are allowed.

6.19 Multi-Buffered A-to-D Converter (MibADC)

The multi-buffered A-to-D converter (MibADC) has a separate power bus for its analog circuitry that enhances the A-to-D performance by preventing digital switching noise on the logic circuitry, which could be present on V_{SS} and V_{CC}, from coupling into the A-to-D analog stage. All A-to-D specifications are given with respect to AD_{REFLO} unless otherwise noted.

7.1 External Reference Resonator/Crystal Oscillator Clock Option

The oscillator is enabled by connecting the appropriate fundamental 4–10 MHz resonator/crystal and load capacitors across the external OSCIN and OSCOUT pins as shown in [Figure 7-2 \(a\)](#). The oscillator is a single-stage inverter held in bias by an integrated bias resistor. This resistor is disabled during leakage test measurement and HALT mode. **TI strongly encourages each customer to submit samples of the device to the resonator/crystal vendors for validation.** The vendors are equipped to determine what load capacitors will best tune their resonator/crystal to the microcontroller device for optimum start-up and operation over temperature/voltage extremes. **Please note that external crystal mode is specified to function only within the temperature ranges of –40°C to 150°C. Above this recommended temperature range it is strongly recommended to use an external clock signal as shown in [Figure 7-2 \(b\)](#).**

An external oscillator source can be used by connecting a 1.8-V clock signal to the OSCIN pin and leaving the OSCOUT pin unconnected (open) as shown in [Figure 7-2b](#).

- A. The values of C1 and C2 should be provided by the resonator/crystal vendor.

8 Detailed Description

8.1 Overview

8.1.1 MibADC

The multi-buffered analog-to-digital converter (MibADC) accepts an analog signal and converts the signal to a 10-bit digital value.

The B1M MibADC module can function in two modes: compatibility mode, where its programmer's model is compatible with the SM470R1x ADC module and its digital results are stored in digital result registers; or in buffered mode, where the digital result registers are replaced with three FIFO buffers, one for each conversion group [event, group1 (G1), and group2 (G2)]. In buffered mode, the MibADC buffers can be serviced by interrupts or by the DMA.

8.1.1.1 MibADC Event Trigger Enhancements

The MibADC includes two major enhancements over the event-triggering capability of the SM470R1x ADC.

- Both group 1 and the event group can be configured for event-triggered operation, providing up to two event-triggered groups.
- The trigger source and polarity can be selected individually for both group1 and the event group from the options identified in [Table 8-1](#).

Table 8-1. MibADC Event Hookup Configuration

| EVENT NO. | SOURCE SELECT BITS FOR G1 OR EVENT (G1SRC[1:0] OR EVSRC[1:0]) | SIGNAL PIN NAME |
|-----------|--|-----------------|
| EVENT1 | 00 | ADEVT |
| EVENT2 | 01 | HET18 |
| EVENT3 | 10 | Reserved |
| EVENT4 | 11 | Reserved |

For group1, these event-triggered selections are configured via the group 1 source select bits (G1SRC[1:0]) in the AD event source register (ADEVTSRC[5:4]). For the event group, these event-triggered selections are configured via the event group source select bits (EVSRC[1:0]) in the AD event source register (ADEVTSRC[1:0]).

For more detailed functional information on the MibADC, see the *TMS470R1x Multi-Buffered Analog-to-Digital Converter (MibADC) Reference Guide* ([SPNU206](#)).

8.1.2 JTAG Interface

There are two main test access ports (TAPs) on the device:

- SM470R1x CPU TAP
- Device TAP for factory test

Some of the JTAG pins are shared among these two TAPs. The hookup is illustrated in [Figure 8-1](#).

Figure 8-1. JTAG Interface

8.1.3 High-End Timer (HET) Timings

8.1.3.1 Minimum PWM Output Pulse Width

This is equal to one high resolution clock period (HRP). The HRP is defined by the 6-bit high resolution prescale factor (hr), which is user defined, giving prescale factors of 1 to 64, with a linear increment of codes.

Therefore, the minimum PWM output pulse width = $HRP(\min) = hr(\min)/SYSCLK = 1/SYSCLK$

For example, for a SYSCLK of 30 MHz, the minimum PWM output pulse width = $1/30 = 33.33 \text{ ns}$

8.1.3.2 Minimum Input Pulses that can be Captured

The input pulse width must be greater or equal to the low resolution clock period (LRP), that is, the HET loop (the HET program must fit within the LRP). The LRP is defined by the 3-bit loop-resolution prescale factor (lr), which is user defined, with a power of 2 increment of codes. That is, the value of lr can be 1, 2, 4, 8, 16, or 32.

Therefore, the minimum input pulse width = $LRP(\min) = hr(\min) \times lr(\min)/SYSCLK = 1 \times 1/SYSCLK$

For example, with a SYSCLK of 30 MHz, the minimum input pulse width = $1 \times 1/30 = 33.33 \text{ ns}$

NOTE

Once the input pulse width is greater than LRP, the resolution of the measurement is still HRP. (That is, the captured value gives the number of HRP clocks inside the pulse.)

Abbreviations:

hr = HET high resolution divide rate = 1, 2, 3,...63, 64

lr = HET low resolution divide rate = 1, 2, 4, 8, 16, 32

High resolution clock period = $HRP = hr/SYSCLK$

Loop resolution clock period = $LRP = hr \times lr/SYSCLK$

8.1.4 Interrupt Priority (IEM to CIM)

Interrupt requests originating from the B1M peripheral modules (that is, SPI1 or SPI2; SCI1 or SCI2; RTI; and so forth) are assigned to channels within the 48-channel interrupt expansion module (IEM) where, via programmable register mapping, these channels are then mapped to the 32-channel central interrupt manager (CIM) portion of the SYS module.

Programming multiple interrupt sources in the IEM to the same CIM channel effectively shares the CIM channel between sources.

The CIM request channels are maskable so that individual channels can be selectively disabled. All interrupt requests can be programmed in the CIM to be of either type:

- Fast interrupt request (FIQ)
- Normal interrupt request (IRQ)

The CIM prioritizes interrupts. The precedence of request channels decrease with ascending channel order in the CIM (0 [highest] and 31 [lowest] priority). For IEM-to-CIM default mapping, channel priorities, and their associated modules, see [Table 8-2](#).

Table 8-2. Interrupt Priority (IEM and CIM)

8.1.5 Expansion Bus Module (EBM)

The expansion bus module (EBM) is a standalone module used to bond out both general-purpose input/output pins and expansion bus interface pins. This module supports the multiplexing of the GIO and the expansion bus interface functions. The module also supports 8- and 16-bit expansion bus memory interface mappings as well as mapping of the following expansion bus signals:

- 27-bit address bus (EBADDR[26:0] for x8, 19-bit address bus (EBADDR[18:0] for x16)
- 8- or 16-bit data bus (EBDATA[7:0] or EBDATA[15:0])
- 2 write strobes (EBWR[1:0])
- 2 memory chip selects (EBCS[6:5])
- 1 output enable (EBOE)
- 1 external hold signal for interfacing to slow memories (EBHOLD)
- 1 DMA request line (EBDMAREQ[0])

Table 8-3 shows the multiplexing of I/O signals with the expansion bus interface signals. The mapping of these pins varies depending on the memory mode.

8.2 Memory

Figure 8-2 shows the memory map of the B1M device.

- A. Memory addresses are configurable by the system (SYS) module within the range of 0x0000_0000 to 0xFFE0_0000.
- B. The CPU registers are not part of the memory map.

Figure 8-2. SM470R1B1M Memory Map

8.2.1 Memory Selects

Memory selects allow the user to address memory arrays (that is, flash, RAM, and HET RAM) at user-defined addresses. Each memory select has its own set (low and high) of memory base address registers (MFBAHRx and MFBALRx) that, together, define the array's starting (base) address, block size, and protection.

The base address of each memory select is configurable to any memory address boundary that is a multiple of the decoded block size. For more information on how to control and configure these memory select registers, see the bus structure and memory sections of the *TMS470R1x System Module Reference Guide* ([SPNU189](#)).

For the memory selection assignments and the memory selected, see [Table 8-5](#).

(1) x8 refers to size of memory in 8-bits; x16 refers to size of memory in 16-bits.

(2) The starting addresses for both RAM memory-select signals cannot be offset from each other by a multiple of the user-defined block size in the memory-base address register.

8.2.1.1 JTAG Security Module

The B1M device includes a JTAG security module to provide maximum security to the memory contents. The visible unlock code can be in the OTP sector or in the first bank of the user-programmable memory. For the B1M, the visible unlock code is in the OTP sector at address 0x0000_01F8.

8.2.1.2 Memory Security Module

The B1M device also includes a memory security module (MSM) to provide additional security and flexibility to the memory contents' protection. The password for unlocking the MSM is located in the four words just before the flash protection keys.

8.2.1.3 RAM

The B1M device contains 64KB of internal static RAM configurable by the SYS module to be addressed within the range of 0x0000_0000 to 0xFFE0_0000. This B1M RAM is implemented in one 64KB array selected by two memory-select signals. This B1M configuration imposes an additional constraint on the memory map for RAM; the starting addresses for both RAM memory selects cannot be offset from each other by the multiples of the size of the physical RAM (that is, 64K bytes for the B1M device). The B1M RAM is addressed through memory selects 2 and 3.

The RAM can be protected by the memory protection unit (MPU) portion of the SYS module, allowing the user finer blocks of memory protection than is allowed by the memory selects. The MPU is ideal for protecting an operating system while allowing access to the current task. For more detailed information on the MPU portion of the SYS module and memory protection, see the memory section of the *TMS470R1x System Module Reference Guide* ([SPNU189](#)).

8.2.1.4 F05 Flash

The F05 flash memory is a nonvolatile electrically erasable and programmable memory implemented with a 32-bit-wide data bus interface. The F05 flash has an external state machine for programming and erase functions. See the *Flash read* and *Flash program and erase* sections.

8.2.1.4.1 Flash Protection Keys

The B1M device provides flash protection keys. These four 32-bit protection keys prevent program/erase/compaction operations from occurring until after the four protection keys have been matched by the CPU loading the correct user keys into the FMPKEY control register. The protection keys on the B1M are located in the last 4 words of the first 64K sector.

8.2.1.4.2 Flash Read

The B1M flash memory is configurable by the SYS module to be addressed within the range of 0x0000_0000 to 0xFFE0_0000. The flash is addressed through memory selects 0 and 1.

NOTE

The flash external pump voltage (V_{CCP}) is required for all operations (program, erase, and read).

8.2.1.4.3 Flash Pipeline Mode

When in pipeline mode, the flash operates with a system clock frequency of up to 60 MHz (versus a system clock frequency of 30 MHz in normal mode). Flash in pipeline mode is capable of accessing 64-bit words and provides two 32-bit pipelined words to the CPU. Also, in pipeline mode the flash can be read with no wait states when memory addresses are contiguous (after the initial 1- or 2-wait-state reads).

NOTE

After a system reset, pipeline mode is disabled (ENPIPE bit [FMREGOPT.0] is a 0). In other words, the B1M device powers up and comes out of reset in non-pipeline mode. Furthermore, setting the flash configuration mode bit (GBLCTRL.4) will override pipeline mode.

8.2.1.4.4 Flash Program and Erase

The B1M device flash contains two 512KB memory arrays (or banks), for a total of 1MB of flash, and consists of sixteen sectors. These sixteen sectors are sized as follows:

Table 8-6. Sectors

| SECTOR NO. | SEGMENT | LOW ADDRESS | HIGH ADDRESS | MEMORY ARRAYS (OR BANKS) |
|------------|---------|-------------|--------------|--------------------------|
| OTP | 2KB | 0x0000_0000 | 0x0000_007FF | BANK0 (512KB) |
| 0 | 64KB | 0x0000_0000 | 0x0000_FFFF | |
| 1 | 64KB | 0x0001_0000 | 0x0001_FFFF | |
| 2 | 64KB | 0x0002_0000 | 0x0002_FFFF | |
| 3 | 64KB | 0x0003_0000 | 0x0003_FFFF | |
| 4 | 64KB | 0x0004_0000 | 0x0004_FFFF | |
| 5 | 64KB | 0x0005_0000 | 0x0005_FFFF | |
| 6 | 64KB | 0x0006_0000 | 0x0006_FFFF | |
| 7 | 64KB | 0x0007_0000 | 0x0007_FFFF | BANK1 (512KB) |
| 0 | 64KB | 0x0008_0000 | 0x0008_FFFF | |
| 1 | 64KB | 0x0009_0000 | 0x0009_FFFF | |
| 2 | 64KB | 0x000A_0000 | 0x000A_FFFF | |
| 3 | 64KB | 0x000B_0000 | 0x000B_FFFF | |
| 4 | 64KB | 0x000C_0000 | 0x000C_FFFF | |
| 5 | 64KB | 0x000D_0000 | 0x000D_FFFF | |
| 6 | 64KB | 0x000E_0000 | 0x000E_FFFF | |
| 7 | 64KB | 0x000F_0000 | 0x000F_FFFF | |

The minimum size for an erase operation is one sector. The maximum size for a program operation is one 16-bit word.

NOTE

The flash external pump voltage (V_{CCP}) is required for all operations (program, erase, and read).

Execution can occur from one bank while programming/erasing any or all sectors of another bank. However, execution cannot occur from any sector within a bank that is being programmed or erased.

NOTE

When the OTP sector is enabled, the rest of flash memory is disabled. The OTP memory can only be read or programmed from code executed out of RAM.

8.2.1.4.5 HET RAM

The B1M device contains HET RAM. The HET RAM has a 64-instruction capability. The HET RAM is configurable by the SYS module to be addressed within the range of 0x0000_0000 to 0xFFE0_0000. The HET RAM is addressed through memory select 4.

8.2.1.4.6 Peripheral Selects and Base Addresses

The B1M device uses 10 of the 16 peripheral selects to decode the base addresses of the peripherals. These peripheral selects are fixed and transparent to the user since they are part of the decoding scheme used by the SYS module.

Control registers for the peripherals, SYS module, and flash begin at the base addresses shown in [Table 8-7](#).

8.2.1.4.7 Direct-Memory Access (DMA)

The direct-memory access (DMA) controller transfers data to and from any specified location in the B1M memory map (except for restricted memory locations like the system control registers area). The DMA manages up to 16 channels, and supports data transfer for both on-chip and off-chip memories and peripherals. The DMA controller is connected to both the CPU and peripheral buses, enabling these data transfers to occur in parallel with CPU activity and thus maximizing overall system performance.

Although the DMA controller has two possible configurations, for the B1M device, the DMA controller configuration is 32 control packets and 16 channels.

For the B1M DMA request hardwired configuration, see [Table 8-8](#).

Table 8-8. DMA Request Lines Connections⁽¹⁾

| MODULES | DMA REQUEST INTERRUPT SOURCES | | DMA CHANNEL |
|------------------|-------------------------------------|-----------------------------|-------------|
| EBM | Expansion Bus DMA request | EBDMAREQ[0] | DMAREQ[0] |

| Reserved | | | DMAREQ[13] |
| SCI2 | SCI2 end-receive | SCI2DMA0 | DMAREQ[14] |
| SCI2 | SCI2 end-transmit | SCI2DMA1 | DMAREQ[15] |

- (1) For DMA channels with more than one assigned request source, *only one* of the sources listed can be the DMA request generator in a given application. The device has software control to ensure that there are no conflicts between requesting modules.

Each channel has two control packets attached to it, allowing the DMA to continuously load RAM and generate periodic interrupts so that the data can be read by the CPU. The control packets allow for the interrupt enable, and the channels determine the priority level of the interrupt.

DMA transfers occur in one of two modes:

- Non-request mode (used when transferring from memory to memory)
- Request mode (used when transferring from memory to peripheral)

For more detailed functional information on the DMA controller, see the *TMS470R1x Direct Memory Access (DMA) Controller Reference Guide* ([SPNU194](#)).

9 Device and Documentation Support

9.1 Device Support

9.1.1 Device Identification Code Register

The device identification code register identifies the silicon version, the technology family (TF), a ROM or flash device, and an assigned device-specific part number (see [Table 9-1](#)). The B1M device identification code register value is 0xnA5F.

Figure 9-1. SM470 Device ID Bit Allocation Register [offset = 0xFFFF_FFF0h]

| 10 | R/F | 0 1 | ROM/flash bit This bit distinguishes between ROM and flash devices: Flash device ROM device |
| 9-3 | PART NUMBER | | Device-specific part number bits These bits identify the assigned device-specific part number. The assigned device-specific part number for the B1M device is 1001011. |
| 2-0 | 1 | | Mandatory High Bits 2, 1, and 0 are tied high by default. |

9.1.2 Timing Parameter Symbolology

Timing parameter symbols have been created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

| | | | |
|-----------|-------------------|------|--------------------------------|
| CM | Compaction, CMPCT | RD | Read |
| CO | CLKOUT | RST | Reset, $\overline{\text{RST}}$ |
| ER | Erase | RX | SCInRX |
| ICLK | Interface clock | S | Slave mode |
| M | Master mode | SCC | SCInCLK |
| OSC, OSC1 | OSCIN | SIMO | SPIInSIMO |
| OSCO | OSCOOUT | SOMI | SPIInSOMI |
| P | Program, PROG | SPC | SPIInCLK |

| | | | |
|----|------------------------|-----|--------------|
| R | Ready | SYS | System clock |
| R0 | Read margin 0, RDMRGN0 | TX | SCInTX |
| R1 | Read margin 1, RDMRGN1 | | |

Lowercase subscripts and their meanings are:

| | | | |
|---|---------------------|----|------------------------|
| a | access time | r | rise time |
| c | cycle time (period) | su | setup time |
| d | delay time | t | transition time |
| f | fall time | v | valid time |
| h | hold time | w | pulse duration (width) |

The following additional letters are used with these meanings:

| | | | |
|---|-------|---|--|
| H | High | X | Unknown, changing, or don't care level |
| L | Low | Z | High impedance |
| V | Valid | | |

9.2 Development Support

TI offers an extensive line of development tools, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of the SM470R1B1M-HT device applications:

Software Development Tools: Code Composer Studio™ Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any SM470R1B1M-HT device application.

Hardware Development Tools: Extended Development System (XDS™) Emulator

For a complete listing of development-support tools for the SM470R1B1M-HT platform, visit the Texas Instruments website at www.ti.com. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

9.3 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (for example, **TMS470R1B1M**). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

| | |
|------------|--|
| TMX | Experimental device that is not necessarily representative of the final device's electrical specifications |
| TMP | Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification |
| SM | Fully qualified production device |

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

Figure 9-2 illustrates the numbering and symbol nomenclature for the SM470R1x family.

9.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10 Mechanical Packaging and Orderable Information

10.1 Packaging Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

CERAMIC QUAD FLATPACK WITH NCTB

4210345/B 06/12

- NOTES:
- A. All linear dimensions are in millimeters (inches).
 - B. This drawing is subject to change without notice.
 - C. Ceramic quad flatpack with flat leads brazed to non-conductive tie bar carrier.
 - D. This package is hermetically sealed with a metal lid.
 - E. The leads are gold plated and can be solderdipped.
 - F. Leads not shown for clarity purposes.
 - G. Lid and heat sink are connected to GND leads.

 B. This drawing is subject to change without notice.
 C. Falls within JEDEC MS-026

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
