

DC Motor Control HAT with TLE94112ES

Complies with the Raspberry Pi HAT specification

About this document

Scope and purpose

This user manual describes the DC motor control HAT equipped with the TLE94112ES, a twelve-fold half-bridge driver with integrated power stages. This document provides detailed information on the board's content, layout and use. It should be used in conjunction with the TLE94112ES datasheet, which contains full technical details on the device specification and operation.

Intended audience

Engineers, hobbyists and students who want to add a powerful motor control to their projects.

1 Introduction

1.1 DC Motor Control HAT overview

The DC Motor Control HAT with TLE94112ES makes it easy to control up to six independent or eleven cascaded bidirectional DC motors.

The HAT can be controlled by a compatible Raspberry Pi via the SPI interface of the TLE94112ES.

The board features an Infineon TLE94112ES, a twelve-fold half-bridge driver with integrated MOSFETs. Each half-bridge can drive peak currents up to 0.9 A and DC current in the range of 200 mA to 500 mA, depending on the application conditions and the number of activated outputs.

The DC Motor Control HAT has an active reverse polarity protection with the p-channel MOSFET IPD50P04P4L-11.

The HAT can power the Raspberry Pi using Infineon's OPTIREG™ DC/DC converter TLS4125D0EPV50.

The DC Motor Control HAT can be easily connected to a Raspberry Pi via its 40-pin header.

Figure 1 DC Motor Control HAT with TLE94112ES

1.2 Key features

The DC Motor Control HAT has the following features:

- **Can be controlled by compatible Raspberry Pis:**
 - 1 Mod. A+, 1 Mod. B+, 2 Mod. B, 2 Mod. B v1.2, 3 Mod. A+, 3 Mod. B, 3 Mod. B+, 4 Mod. B
 - Zero, Zero W
- **Brushed DC Motor Control up to 0.9 A peak**
 - 5.5 – 18 V normal operating input voltage
 - 18 – 20 V extended operating input voltage
- **Control of:**
 - Six independent bidirectional DC motors
 - Eleven cascaded bidirectional DC motors
- **SPI interface for high configurability and detailed diagnosis**
- **Protections:**
 - Overtemperature
 - Overcurrent
 - Undervoltage
 - Overvoltage
- **Detailed diagnosis per MOSFET:**
 - Individual open load detection
 - Individual overcurrent detection
- **Paralleling outputs for higher current capability (up to 3.6 A)**
- **Motor speed control by PWM**
 - Three independent PWM generators
 - PWM frequency: 80 Hz, 100 Hz or 200 Hz
 - 8-bit resolution, 0.5% duty cycle steps
 - Active freewheeling for lower power dissipation
- **Multiple HATs can be stacked to control an increased number of motors**
- **Reverse polarity protection with IPD50P04P4L-11**
- **Powering of Raspberry Pi with up to 2.5A with TLS4125D0EPV50**
- **EEPROM containing HAT information**

2 DC Motor Control HAT description

For a safe and optimized motor control design, some discrete components are needed.

Figure 4, Figure , Figure and Figure 7 show the schematics and the corresponding layout of the DC Motor Control Shield with TLE94112ES.

2.1 Overview

Figure 3 DC Motor Control HAT connectors

TLE94112ES

The input of the TLE is connected to different capacitors. C11 is there to smooth VCC, the input voltage, C13 to smooth VDD, the 3.3V supply, so glitches do not influence the functionality of the motor driver. C14 and C12 are included to stabilize the input voltage.

TLS4125

The DC/DC converter, the TLS4125D0EPV50 is connected to multiple capacitors and inductors on the input and the output side of the chip. C_IN compensates possible drops in the supply voltage. C56 is there to smooth the input voltage, so glitches cannot disturb the functionality of the converter. L_IN combined with C52, C53, C54 and C55 create an EMI filter. This filter protects the TLS against electromagnetic interference. At the output of the chip L_OUT with C58 and C59 are there to support the voltage conversion and C57 is responsible for stabilizing the output voltage.

2.5 CS Pin Selection

The GPIO 8 (CS0) of the Raspberry Pi is used by default to control the CS (Chip Select) input of the TLE94112ES (Figure 9).

Alternatively, GPIO 7 (CS1), GPIO 22 (CS2) or GPIO 25 (CS3) of the Raspberry Pi can be used instead to stack multiple HATs (refer to section 2.8). In this case, the jumper on the Pinheader can be changed to the matching CS pin (Figure).

Figure 9 Control of CSN of TLE94112ES by GPIO 8 (CS0)

Figure 10 Control of CS of TLE94112ES by GPIO 7 (CS1)

2.6 EEPROM

The DC Motor Control HAT also contains an Electrically Erasable Programmable Read-Only Memory (EEPROM). It allows the Raspberry Pi firmware to automatically load the necessary drivers for the HAT. The CAT24C32 communicates via I2C on ID_SD (GPIO 27) and ID_SC (GPIO 28) with the Raspberry Pi.

If another HAT with an EEPROM is used concurrently with the DC Motor Control HAT, the address of the EEPROM can be adjusted by closing the solder bridge marked with A+1. If the pin is left open, the I2C address is 0x50 and if the bridge is closed it is 0x51.

2.7 Back-Powering

This HAT is able to supply the Raspberry Pi (up to 12.5 W) via its input voltage. The input voltage (recommended 12V) is converted to 5V and maximum 2.5A by the DC/DC converter [TLS4125D0EPV50](#) from Infineon. The output of the chip is connected to the 5V pins of the Raspberry Pi. Consequently the power supply unit of the Raspberry Pi is not necessarily needed. In case the Raspberry Pi is powered separately, the TLS is protected against voltage collision by a p-channel MOSFET and a transistor array.

2.8 Stacking multiple DC Motor Control HATs

It is possible to stack multiple DC Motor Control HATs to increase the number of controlled motors.

In this configuration, the CS input of each TLE94112ES must be controlled individually by different microcontroller GPIOs:

- The TLE94112ES of one DC Motor Control HAT is controlled by GPIO 8 (default setting, Figure).

- The TLE94112ES of the other DC Motor Control HAT is controlled by GPIO 7 (Figure).

The combination with different HATs is possible in general, but compatibility depends on pin usage and bus addresses and cannot be guaranteed for every HAT.

2.9 Pin assignment

To use the DC Motor Control HAT, the necessary control signals can be applied directly at the Raspberry Pi connectors.

Figure shows the pinout/connectors of the DC Motor Control HAT with TLE94112ES.

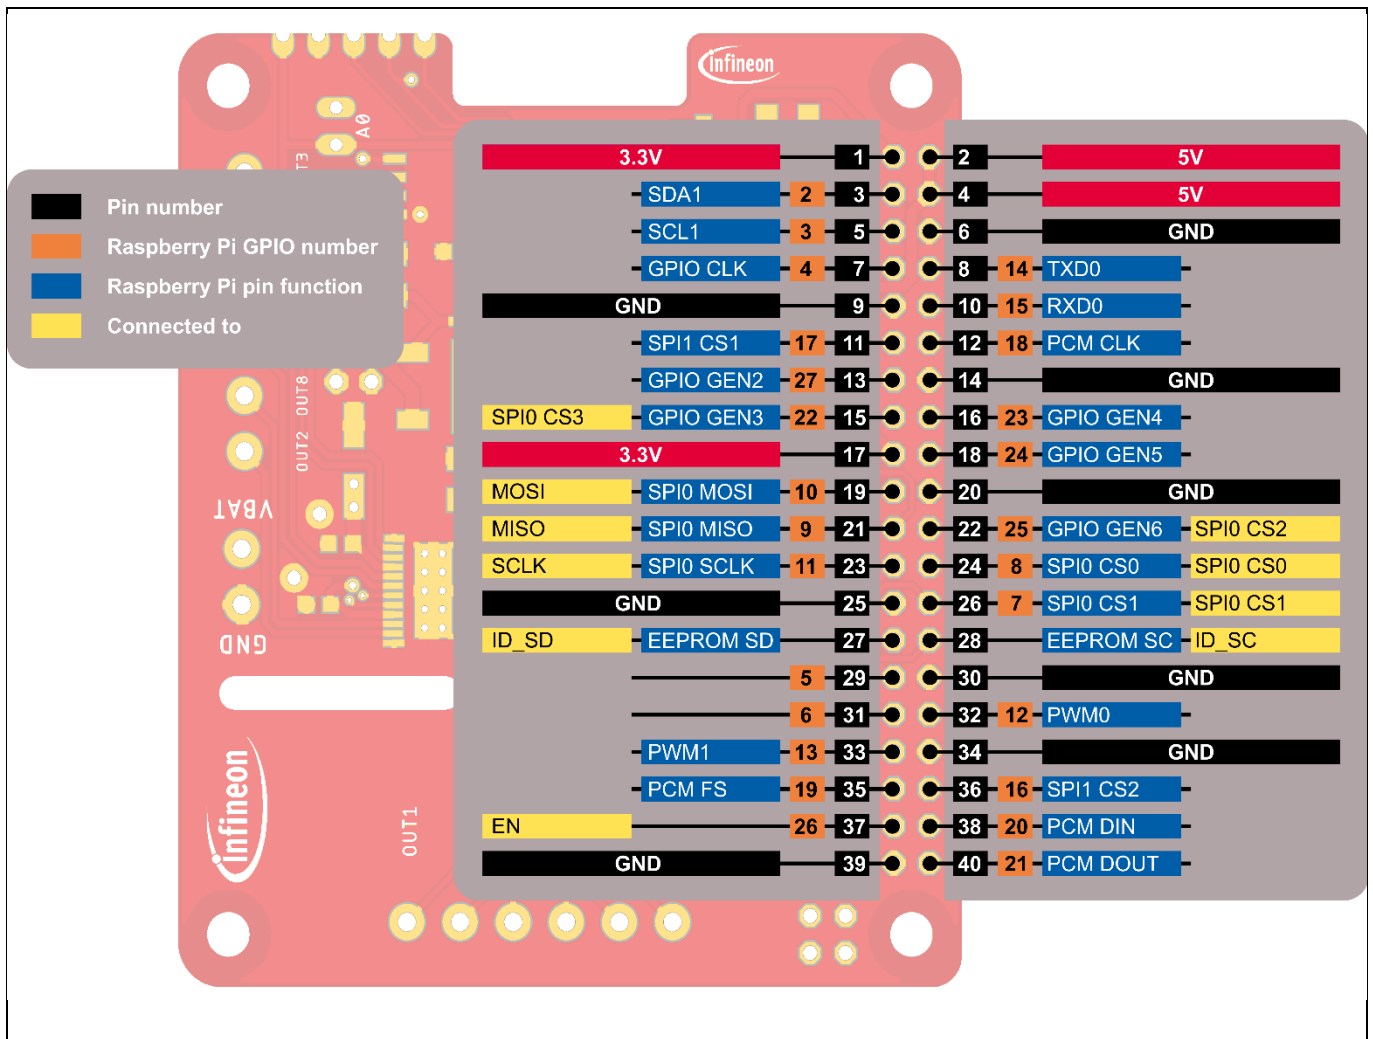

Figure 13 Connectors of DC Motor Control HAT

2.10 Pin definitions and functions

Pin	I/O ¹	Function
GND	-	GND Common 0V reference for all components on the DC Motor Control HAT.
VBAT	-	Battery supply (5.5 – 18V normal, 18-20V extended) Connected to the battery voltage of the HAT
VDD	-	Logic supply (3.3V from Raspberry Pi)
VCC	-	Supply for Backpowering (5V for Raspberry)
SCLK	I	Serial Clock Input ²
MOSI	I	Master Output Slave Input ²

³ Refer to chapter 2.5

3 TLE94112ES overview

The TLE94112ES is a protected twelve-fold half-bridge driver designed especially for automotive motion control applications such as heating, ventilation and air conditioning (HVAC) flap DC motor control. It is part of a larger family offering half-bridge drivers from three outputs to twelve outputs with direct interface or SPI interface.

The half bridge drivers are designed to drive DC motor loads in sequential or parallel operation. Operation modes forward, reverse, brake and high impedance are controlled from a 16-bit SPI interface. It offers diagnosis features such as short circuit, open load, power supply failure and overtemperature detection.

In combination with its low quiescent current, this device is attractive among others for automotive applications. The small fine pitch exposed pad package, PG-TSDSO-24, provides a good thermal performance and reduces PCB-board space and costs.

3.1 Key features of the TLE94112ES

- Twelve half-bridge power outputs
- Optimized EMC behavior
- Very low power consumption in sleep mode
- 3.3V / 5V compatible inputs with hysteresis
- All outputs with overload and short circuit protection
- Independently diagnosable outputs (overcurrent, open load)
- Open load diagnostics in ON-state for all high-side and low-side
- Outputs with selectable open load thresholds (HS1, HS2)
- 16-bit Standard SPI interface with daisy chain and in-frame response capability for control and diagnosis
- Fast diagnosis with the global error flag
- PWM capable outputs for frequencies 80Hz, 100Hz and 200Hz with 8-bit duty cycle resolution
- Overtemperature pre-warning and protection
- Over- and Undervoltage lockout
- Cross-current protection
- AEC-100 Qualified

3.4 Pin definitions and functions

Pin	Symbol	Function
1	GND	Ground. All ground pins should be externally connected together.
2	OUT 1	Power half-bridge 1
3	OUT 5	Power half-bridge 5
4	OUT 7	Power half-bridge 7
5	SDI	Serial data input with internal pull down
6	VDD	Logic supply voltage
7	SDO	Serial data output
8	EN	Enable with internal pull-down; Places device in standby mode by pulling the EN line Low
9	OUT 9	Power half-bridge 9
10	OUT 6	Power half-bridge 6
11	OUT 4	Power half-bridge 4
12	GND	Ground. All ground pins should be externally connected together.
13	GND	Ground. All ground pins should be externally connected together.
14	OUT 3	Power half-bridge 3
15	OUT 10	Power half-bridge 10
16	VS1	Main supply voltage for power half bridges. VS1 should be externally connected to VS2.
17	OUT11	Power half-bridge 11
18	OUT12	Power half-bridge 12
19	CSN	Chip select Not input with internal pull up
20	SCLK	Serial clock input with internal pull down
21	VS2	Main supply voltage for power half bridges. VS1 should be externally connected to VS1.
22	OUT 8	Power half-bridge 8
23	OUT 2	Power half-bridge 2
24	GND	Ground. All ground pins should be externally connected together.
EDP	-	Exposed Die Pad; For cooling purpose only - not usable as electrical ground. Electrical ground must be provided by pins 1, 12, 13, 24
