CAT9554, CAT9554A

8-bit I²C and SMBus I/O Port with Interrupt

Description

The CAT9554 and CAT9554A are CMOS devices that provide 8-bit parallel input/output port expansion for I²C and SMBus compatible applications. These I/O expanders provide a simple solution in applications where additional I/Os are needed: sensors, power switches, LEDs, pushbuttons, and fans.

The CAT9554/9554A consist of an input port register, an output port register, a configuration register, a polarity inversion register and an I²C/SMBus-compatible serial interface.

Any of the eight I/Os can be configured as an input or output by writing to the configuration register. The system master can invert the CAT9554/9554A input data by writing to the active-high polarity inversion register.

The CAT9554/9554A features an active low interrupt output which indicates to the system master that an input state has changed.

The device's extended addressing capability allows up to 8 devices to share the same bus. The CAT9554A is identical to the CAT9554 except the fixed part of the I²C slave address is different. This allows up to 16 of devices (eight CAT9554 and eight CAT9554A) to be connected on the same bus.

Features

- 400 kHz I²C Bus Compatible (Note 1)
- 2.3 V to 5.5 V Operation
- Low Stand-by Current
- 5 V Tolerant I/Os
- 8 I/O Pins that Default to Inputs at Power-up
- High Drive Capability
- Individual I/O Configuration
- Polarity Inversion Register
- Active Low Interrupt Output
- Internal Power-on Reset
- No Glitch on Power-up
- Noise Filter on SDA/SCL Inputs
- Cascadable up to 8 Devices
- Industrial Temperature Range
- 16-lead SOIC and TSSOP, and 16-pad TQFN (4 x 4 mm) Packages
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- White Goods (dishwashers, washing machines)
- Handheld Devices (cell phones, PDAs, digital cameras)
- Data Communications (routers, hubs and servers)

1. All I/Os are set to inputs at RESET.

CAT9554, CAT9554A

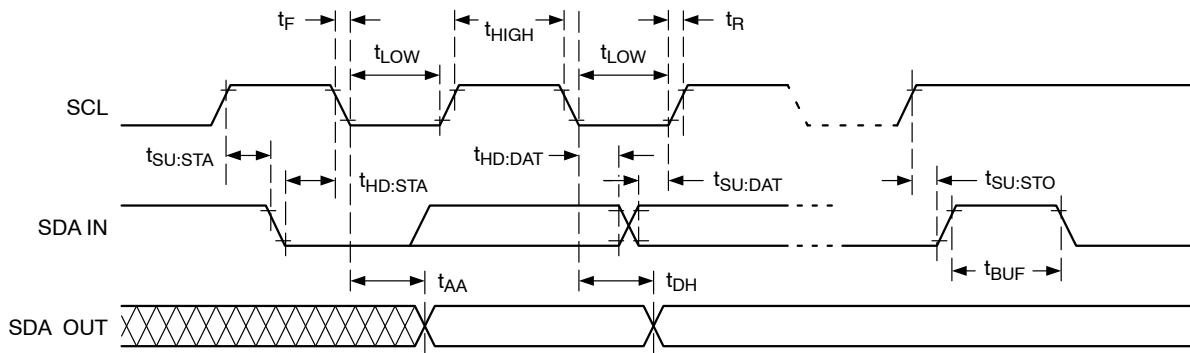

Figure 2. I²C Serial Interface Timing

Pin Description

SCL: Serial Clock

The serial clock input clocks all data transferred into or out of the device. The SCL line requires a pull-up resistor if it is driven by an open drain output.

SDA: Serial Data/Address

The bidirectional serial data/address pin is used to transfer all data into and out of the device. The SDA pin is an open drain output and can be wire-ORed with other open drain or open collector outputs. A pull-up resistor must be connected from SDA line to V_{CC}. The value of the pull-up resistor, R_P, can be calculated based on minimum and maximum values from Figure 3 and Figure 4 (see Note).

A0, A1, A2: Device Address Inputs

These inputs are used for extended addressing capability. The A0, A1, A2 pins should be hardwired to V_{CC} or V_{SS}. When hardwired, up to eight CAT9554/9554As may be addressed on a single bus system. The levels on these inputs are compared with corresponding bits, A2, A1, A0, from the slave address byte.

I/O₀ to I/O₇: Input / Output Ports

Any of these pins may be configured as input or output. The simplified schematic of I/O₀ to I/O₇ is shown in Figure 5. When an I/O is configured as an input, the Q1 and Q2 output transistors are off creating a high impedance input with a weak pull-up resistor (typical 100 kΩ). If the I/O pin is configured as an output, the push-pull output stage is enabled. Care should be taken if an external voltage is applied to an I/O pin configured as an output due to the low impedance paths that exist between the pin and either V_{CC} or V_{SS}.

Figure 3. Minimum R_P Value vs. Supply Voltage

Figure 4. Maximum R_P Value vs. Bus Capacitance

NOTE: According to the Fast Mode I²C bus specification, for bus capacitance up to 200 pF, the pull up device can be a resistor. For bus loads between 200 pF and 400 pF, the pull-up device can be a current source (I_{max} = 3 mA) or a switched resistor circuit.

INT: Interrupt Output

The open-drain interrupt output is activated when one of the port pins configured as an input changes state (differs from the corresponding input port register bit state). The interrupt is deactivated when the input returns to its previous

state or the input port register is read. Changing an I/O from an output to an input may cause a false interrupt if the state of the pin does not match the contents of the input port register.

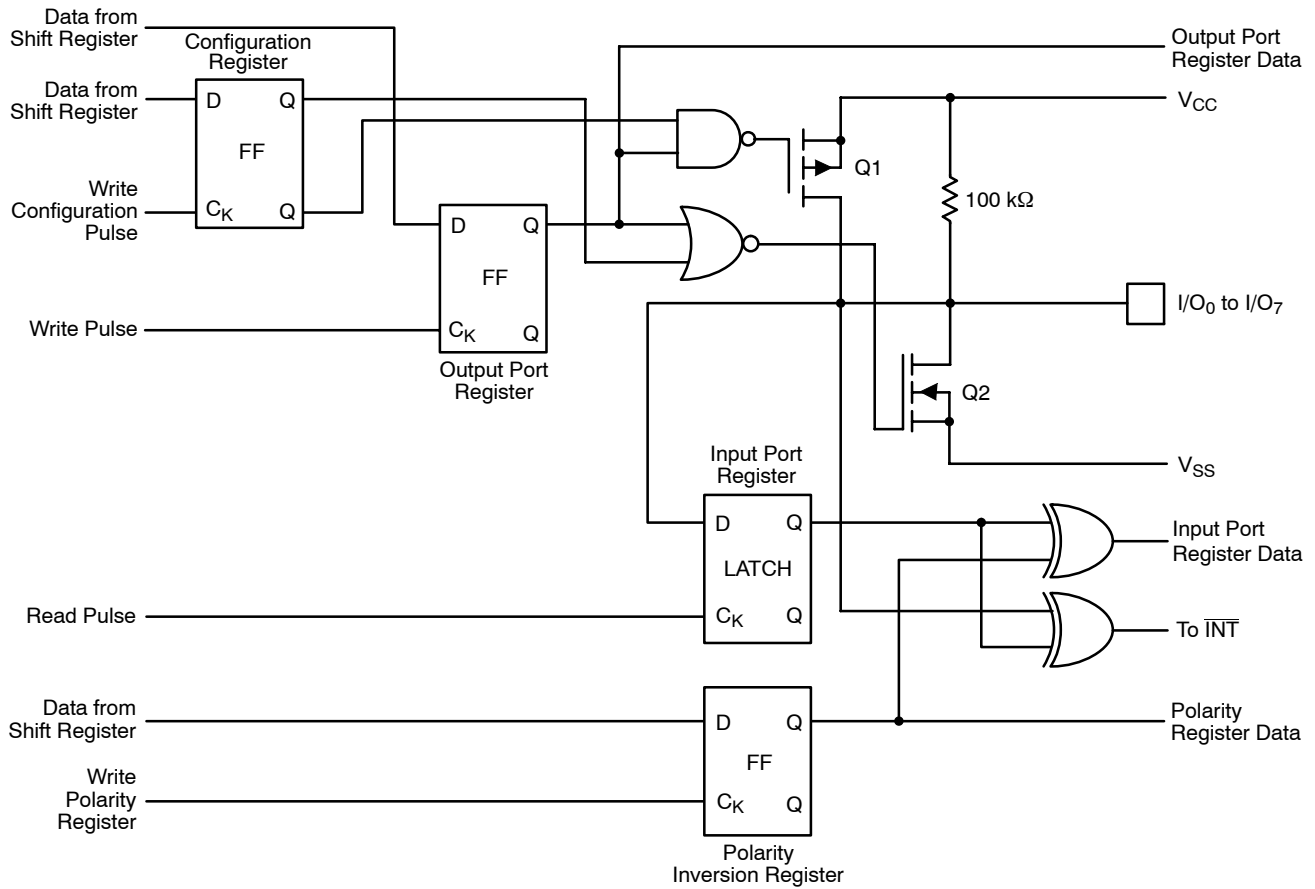

Figure 5. Simplified Schematic of I/O₀ to I/O₇

CAT9554, CAT9554A

Functional Description

The CAT9554 and CAT9554A general purpose input/output (GPIO) peripherals provide up to eight I/O ports, controlled through an I²C compatible serial interface.

The CAT9554/9554A support the I²C Bus data transmission protocol. This I²C Bus protocol defines any device that sends data to the bus to be a transmitter and any device receiving data to be a receiver. The transfer is controlled by the Master device which generates the serial clock and all START and STOP conditions for bus access. The CAT9554/9554A operate as a Slave device. Both the Master device and Slave device can operate as either transmitter or receiver, but the Master device controls which mode is activated.

I²C Bus Protocol

The features of the I²C bus protocol are defined as follows:

1. Data transfer may be initiated only when the bus is not busy.
2. During a data transfer, the data line must remain stable whenever the clock line is high. Any changes in the data line while the clock line is high will be interpreted as a START or STOP condition (Figure 6).

Figure 6. START/STOP Condition

Figure 7. CAT9554 Slave Address

Figure 8. CAT9554A Slave Address

START and STOP Conditions

The START Condition precedes all commands to the device, and is defined as a HIGH to LOW transition of SDA when SCL is HIGH. The CAT9554/9554A monitors the SDA and SCL lines and will not respond until this condition is met.

A LOW to HIGH transition of SDA when SCL is HIGH determines the STOP condition. All operations must end with a STOP condition.

Device Addressing

After the bus Master sends a START condition, a slave address byte is required to enable the CAT9554/9554A for a read or write operation. The four most significant bits of the slave address are fixed as binary 0100 for the CAT9554 (Figure 7) and as 0111 for the CAT9554A (Figure 8). The CAT9554/9554A uses the next three bits as address bits.

The address bits A2, A1 and A0 are used to select which device is accessed from maximum eight devices on the same bus. These bits must compare to their hardwired input pins. The 8th bit following the 7-bit slave address is the R/W bit that specifies whether a read or write operation is to be performed. When this bit is set to "1", a read operation is initiated, and when set to "0", a write operation is selected.

Following the START condition and the slave address byte, the CAT9554/9554A monitors the bus and responds with an acknowledge (on the SDA line) when its address matches the transmitted slave address. The CAT9554/9554A then performs a read or a write operation depending on the state of the R/W bit.

CAT9554, CAT9554A

Acknowledge

After a successful data transfer, each receiving device is required to generate an acknowledge. The acknowledging device pulls down the SDA line during the ninth clock cycle, signaling that it received the 8 bits of data. The SDA line remains stable LOW during the HIGH period of the acknowledge related clock pulse (Figure 6).

The CAT9554/9554A responds with an acknowledge after receiving a START condition and its slave address. If the device has been selected along with a write operation, it responds with an acknowledge after receiving each 8-bit byte.

When the CAT9554/9554A begins a READ mode it transmits 8 bits of data, releases the SDA line, and monitors the line for an acknowledge. Once it receives this acknowledge, the CAT9554/9554A will continue to transmit data. If no acknowledge is sent by the Master, the device terminates data transmission and waits for a STOP condition. The master must then issue a STOP condition to return the CAT9554/9554A to the standby power mode and place the device in a known state.

Registers and Bus Transactions

The CAT9554/9554A consist of an input port register, an output port register, a polarity inversion register and a configuration register. Table 7 shows the register address table. Tables 8 to 11 list Register 0 through Register 3 information.

Table 7. REGISTER COMMAND BYTE

Command (hex)	Protocol	Function
0x00	Read byte	Input port register
0x01	Read/write byte	Output port register
0x02	Read/write byte	Polarity inversion register
0x03	Read/write byte	Configuration register

The command byte is the first byte to follow the device address byte during a write/read bus transaction. The register command byte acts as a pointer to determine which register will be written or read.

The input port register is a read only port. It reflects the incoming logic levels of the I/O pins, regardless of whether the pin is defined as an input or an output by the configuration register. Writes to the input port register are ignored.

Table 8. REGISTER 0 – INPUT PORT REGISTER

bit	I ₇	I ₆	I ₅	I ₄	I ₃	I ₂	I ₁	I ₀
default	1	1	1	1	1	1	1	1

Table 9. REGISTER 1 – OUTPUT PORT REGISTER

Table 10. REGISTER 2 – POLARITY INVERSION REGISTER

bit	N ₇	N ₆	N ₅	N ₄	N ₃	N ₂	N ₁	N ₀
default	0	0	0	0	0	0	0	0

Table 11. REGISTER 3 – CONFIGURATION REGISTER

bit	C ₇	C ₆	C ₅	C ₄	C ₃	C ₂	C ₁	C ₀
default	1	1	1	1	1	1	1	1

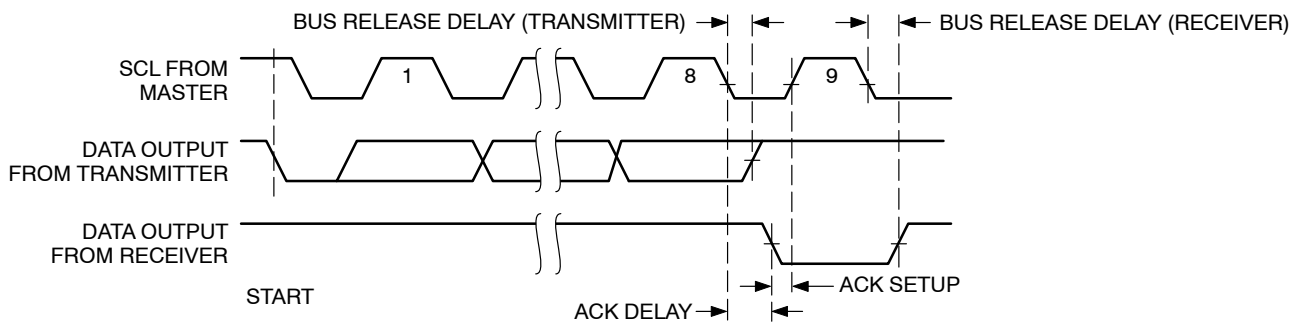

Figure 9. Acknowledge Timing

CAT9554, CAT9554A

The output port register sets the outgoing logic levels of the I/O ports, defined as outputs by the configuration register. Bit values in this register have no effect on I/O pins defined as inputs. Reads from the output port register reflect the value that is in the flip-flop controlling the output, not the actual I/O pin value.

The polarity inversion register allows the user to invert the polarity of the input port register data. If a bit in this register is set ("1") the corresponding input port data is inverted. If a bit in the polarity inversion register is cleared ("0"), the original input port polarity is retained.

The configuration register sets the directions of the ports. Set the bit in the configuration register to enable the

corresponding port pin as an input with a high impedance output driver. If a bit in this register is cleared, the corresponding port pin is enabled as an output. At power-up, the I/Os are configured as inputs with a weak pull-up resistor to V_{CC} .

Data is transmitted to the CAT9554/9554A registers using the write mode shown in Figure 10 and Figure 11.

The CAT9554/9554A registers are read according to the timing diagrams shown in Figure 12 and Figure 13. Once a command byte has been sent, the register which was addressed will continue to be accessed by reads until a new command byte will be sent.

Figure 10. Write to Output Port Register

Figure 11. Write to Configuration or Polarity Inversion Register

CAT9554, CAT9554A

Power-On Reset Operation

When the power supply is applied to V_{CC} pin, an internal power-on reset pulse holds the CAT9554/9554A in a reset state until V_{CC} reaches V_{POR} level. At this point, the reset

condition is released and the internal state machine and the CAT9554/9554A registers are initialized to their default state.

SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does SCILLC assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. "Typical" parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part. SCILLC is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
