

# COMLINEAR® CLC1008, CLC2008

## 0.5mA, Low Cost, 2.5 to 5.5V, 75MHz Rail-to-Rail Amplifiers

### FEATURES

- 505 $\mu$ A supply current
- 75MHz bandwidth
- Input voltage range with 5V supply: -0.3V to 3.8V
- Output voltage range with 5V supply: 0.07V to 4.86V
- 50V/ $\mu$ s slew rate
- 12nV/ $\sqrt{\text{Hz}}$  input voltage noise
- 15mA linear output current
- Fully specified at 2.7V and 5V supplies
- Replaces AD8031 in  $V_S \leq 5$  applications

### APPLICATIONS

- Portable/battery-powered applications
- Mobile communications, cell phones, pagers
- ADC buffer
- Active filters
- Portable test instruments
- Signal conditioning
- Medical Equipment
- Portable medical instrumentation

### General Description

The COMLINEAR CLC1008 (single) and CLC2008 (dual) offer superior dynamic performance with 75MHz small signal bandwidth and 50V/ $\mu$ s slew rate. These amplifiers use only 505 $\mu$ A of supply current and are designed to operate from a supply range of 2.5V to 5.5V ( $\pm 1.25$  to  $\pm 2.75$ ). The combination of low power, high output current drive, and rail-to-rail performance make the CLC1008 and CLC2008 well suited for battery-powered communication/computing systems.

The combination of low cost and high performance make the CLC1008 and CLC2008 suitable for high volume applications in both consumer and industrial applications such as wireless phones, scanners, and color copiers.

### Typical Performance Examples

Frequency Response vs.  $V_{OUT}$

Frequency Response vs. Temperature

### Ordering Information

Part Number	Package	Pb-Free	RoHS Compliant	Operating Temperature Range	Packaging Method
CLC1008IST5X	SOT23-5	Yes	Yes	-40°C to +85°C	Reel
CLC2008ISO8X	SOIC-8	Yes	Yes	-40°C to +85°C	Reel

Moisture sensitivity level for all parts is MSL-1.

### CLC1008 Pin Configuration

### CLC1008 Pin Assignments

Pin No.	Pin Name	Description
1	OUT	Output
2	-VS	Negative supply
3	+IN	Positive input
4	-IN	Negative input
5	+VS	Positive supply

### CLC2008 Pin Configuration

### CLC2008 Pin Configuration

Pin No.	Pin Name	Description
1	OUT1	Output, channel 1
2	-IN1	Negative input, channel 1
3	+IN1	Positive input, channel 1
4	-VS	Negative supply
5	+IN2	Positive input, channel 2
6	-IN2	Negative input, channel 2
7	OUT2	Output, channel 2
8	+VS	Positive supply

## Absolute Maximum Ratings

The safety of the device is not guaranteed when it is operated above the "Absolute Maximum Ratings". The device should not be operated at these "absolute" limits. Adhere to the "Recommended Operating Conditions" for proper device function. The information contained in the Electrical Characteristics tables and Typical Performance plots reflect the operating conditions noted on the tables and plots.

Parameter	Min	Max	Unit
Supply Voltage	0	6	V
Input Voltage Range	$-V_S - 0.5V$	$+V_S + 0.5V$	V
Continuous Output Current	-30	30	mA

## Reliability Information

Parameter	Min	Typ	Max	Unit
Junction Temperature			175	°C
Storage Temperature Range	-65		150	°C
Lead Temperature (Soldering, 10s)			260	°C
Package Thermal Resistance				
5-Lead SOT23		221		°C/W
8-Lead SOIC		100		°C/W

Notes:

Package thermal resistance ( $\theta_{JA}$ ), JEDEC standard, multi-layer test boards, still air.

## Recommended Operating Conditions

Parameter	Min	Typ	Max	Unit
Operating Temperature Range	-40		+85	°C
Supply Voltage Range	2.5		5.5	V

## Electrical Characteristics at +2.7V

$T_A = 25^\circ\text{C}$ ,  $V_S = +2.7\text{V}$ ,  $R_f = R_g = 1\text{k}\Omega$ ,  $R_L = 1\text{k}\Omega$  to  $V_S/2$ ,  $G = 2$ ; unless otherwise noted.

## Application Information

### General Description

The CLC1008 family are a single supply, general purpose, voltage-feedback amplifiers fabricated on a complementary bipolar process. The CLC1008 offers 75MHz unity gain bandwidth, 50V/ $\mu$ s slew rate, and only 505 $\mu$ A supply current. It features a rail-to-rail output stage and is unity gain stable.

Figures 1, 2, and 3 illustrate typical circuit configurations for non-inverting, inverting, and unity gain topologies for dual supply applications. They show the recommended bypass capacitor values and overall closed loop gain equations. Figure 4 shows the typical non-inverting gain circuit for single supply applications.

The common mode input range extends to 300mV below ground in single supply operation. Exceeding these values will not cause phase reversal. However, if the input voltage exceeds the rails by more than 0.5V, the input ESD devices will begin to conduct.

The design uses a Darlington output stage. The output stage is short circuit protected and offers "soft" saturation protection that improves recovery time.

Figure 3. Unity Gain Circuit

Figure 4. Single Supply Non-Inverting Gain Circuit

Figure 1. Typical Non-Inverting Gain Circuit

Figure 2. Typical Inverting Gain Circuit

For optimum response at a gain of +2, a feedback resistor of 1k $\Omega$  is recommended. Figure 5 illustrates the CLC1008 frequency response with both 1k $\Omega$  and 2k $\Omega$  feedback resistors.

Figure 5. Frequency Response vs.  $R_f$

### Power Dissipation

Power dissipation should not be a factor when operating under the stated 1k ohm load condition. However, applications with low impedance, DC coupled loads should be analyzed to ensure that maximum allowed junction temperature is not exceeded. Guidelines listed below can be used to verify that the particular application will not cause the device to operate beyond its intended operating range.

Maximum power levels are set by the absolute maximum junction rating of 150°C. To calculate the junction temperature, the package thermal resistance value  $\Theta_{JA}$  ( $\Theta_{JA}$ ) is used along with the total die power dissipation.

$$T_{\text{Junction}} = T_{\text{Ambient}} + (\Theta_{JA} \times P_D)$$

Where  $T_{\text{Ambient}}$  is the temperature of the working environment.

In order to determine  $P_D$ , the power dissipated in the load needs to be subtracted from the total power delivered by the supplies.

$$P_D = P_{\text{supply}} - P_{\text{Load}}$$

Supply power is calculated by the standard power equation.

$$P_{\text{supply}} = V_{\text{supply}} \times I_{\text{RMS supply}}$$

$$V_{\text{supply}} = V_{S+} - V_{S-}$$

Power delivered to a purely resistive load is:

$$P_{\text{Load}} = ((V_{\text{LOAD}})_{\text{RMS}}^2) / R_{\text{Load eff}}$$

The effective load resistor ( $R_{\text{Load eff}}$ ) will need to include the effect of the feedback network. For instance,

$R_{\text{Load eff}}$  in Figure 3 would be calculated as:

$$R_L \parallel (R_f + R_g)$$

These measurements are basic and are relatively easy to perform with standard lab equipment. For design purposes however, prior knowledge of actual signal levels and load impedance is needed to determine the dissipated power. Here,  $P_D$  can be found from

$$P_D = P_{\text{Quiescent}} + P_{\text{Dynamic}} - P_{\text{Load}}$$

Quiescent power can be derived from the specified  $I_S$  values along with known supply voltage,  $V_{\text{Supply}}$ . Load power can be calculated as above with the desired signal amplitudes using:

$$(V_{\text{LOAD}})_{\text{RMS}} = V_{\text{PEAK}} / \sqrt{2}$$

$$(I_{\text{LOAD}})_{\text{RMS}} = (V_{\text{LOAD}})_{\text{RMS}} / R_{\text{Load eff}}$$

The dynamic power is focused primarily within the output stage driving the load. This value can be calculated as:

$$P_{\text{DYNAMIC}} = (V_{S+} - V_{\text{LOAD}})_{\text{RMS}} \times (I_{\text{LOAD}})_{\text{RMS}}$$

Assuming the load is referenced in the middle of the power rails or  $V_{\text{Supply}}/2$ .

The CLC1008 is short circuit protected. However, this may not guarantee that the maximum junction temperature (+150°C) is not exceeded under all conditions. Figure 6 shows the maximum safe power dissipation in the package vs. the ambient temperature for the packages available.

Figure 6. Maximum Power Derating

### Driving Capacitive Loads

Increased phase delay at the output due to capacitive loading can cause ringing, peaking in the frequency response, and possible unstable behavior. Use a series resistance,  $R_S$ , between the amplifier and the load to help improve stability and settling performance. Refer to Figure 7.

Figure 7. Addition of  $R_S$  for Driving Capacitive Loads

Table 1 provides the recommended  $R_S$  for various capacitive loads. The recommended  $R_S$  values result in

approximately <1dB peaking in the frequency response. The Frequency Response vs.  $C_L$  plot, on page 4, illustrates the response of the CLCx008.

$C_L$ (pF)	$R_S$ ( $\Omega$ )	-3dB BW (kHz)
10pF	0	22
20pF	100	19
50pF	100	12
100pF	100	10.2

Table 1: Recommended  $R_S$  vs.  $C_L$

For a given load capacitance, adjust  $R_S$  to optimize the tradeoff between settling time and bandwidth. In general, reducing  $R_S$  will increase bandwidth at the expense of additional overshoot and ringing.

### Overdrive Recovery

An overdrive condition is defined as the point when either one of the inputs or the output exceed their specified voltage range. Overdrive recovery is the time needed for the amplifier to return to its normal or linear operating point. The recovery time varies, based on whether the input or output is overdriven and by how much the range is exceeded. The CLC1008 and CLC2008 will typically recover in less than 20ns from an overdrive condition. Figure 8 shows the CLC1008 in an overdriven condition.

Figure 8. Overdrive Recovery

### Layout Considerations

General layout and supply bypassing play major roles in

high frequency performance. CADEKA has evaluation boards to use as a guide for high frequency layout and as an aid in device testing and characterization. Follow the steps below as a basis for high frequency layout:

- Include 6.8 $\mu$ F and 0.1 $\mu$ F ceramic capacitors for power supply decoupling
- Place the 6.8 $\mu$ F capacitor within 0.75 inches of the power pin
- Place the 0.1 $\mu$ F capacitor within 0.1 inches of the power pin
- Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance
- Minimize all trace lengths to reduce series inductances

Refer to the evaluation board layouts below for more information.

### Evaluation Board Information

The following evaluation boards are available to aid in the testing and layout of these devices:

Evaluation Board	Products
CEB002	CLC1008 in SOT23
CEB003	CLC1008 in SOIC
CEB006	CLC2008 in SOIC
CEB010	CLC2008 in MSOP

### Evaluation Board Schematics

Evaluation board schematics and layouts are shown in Figures 8-14. These evaluation boards are built for dual-supply operation. Follow these steps to use the board in a single-supply application:

1. Short  $-V_S$  to ground.
2. Use C3 and C4, if the  $-V_S$  pin of the amplifier is not directly connected to the ground plane.

## Mechanical Dimensions

### SOT23-5 Package

**NOTES:**

1. Dimensions and tolerances are as per ANSI Y14.5M-1982.
  2. Package surface to be matte finish VDI 11~13.
  3. Die is facing up for mold. Die is facing down for trim/form, ie. reverse trim/form.
  4. The footlength measuring is based on the guage plane method.
- △ Dimension are exclusive of mold flash and gate burr.  
 △ Dimension are exclusive of solder plating.

### SOIC-8

SOIC-8		
SYMBOL	MIN	MAX
A1	0.10	0.25
B	0.36	0.48
C	0.19	0.25
D	4.80	4.98
E	3.81	3.99
e	1.27 BSC	
H	5.80	6.20
h	0.25	0.5
L	0.41	1.27
A	1.37	1.73
θ1	0°	8°
X	0.55 ref	
θ2	7° BSC	

**NOTE:**

1. All dimensions are in millimeters.
2. Lead coplanarity should be 0 to 0.1mm (0.004") max.
3. Package surface finishing: VDI 24~27
4. All dimension excluding mold flashes.
5. The lead width, B to be determined at 0.1905mm from the lead tip.
