

Galvanically Isolated Current Sensor IC with Differential Output and Externally Adjustable Gain

FEATURES AND BENEFITS

- Fully differential architecture for improved immunity to offset drift and common mode noise
- Spare differential back end amplifier for externally adjustable gain and bandwidth using simple RC networks
- Greatly improved bandwidth through proprietary amplifier and filter design techniques
- High bandwidth 120 kHz analog output
- Patented integrated digital temperature compensation circuitry allows nearly closed-loop accuracy, through entire temperature range, in an open loop sensor
- 1.1 mΩ primary conductor resistance for low power loss and high inrush current withstanding capability
- Small footprint, low-profile QSOP24 package suitable for space-constrained applications
- Integrated shield virtually eliminates capacitive coupling from current conductor to die due to high dV/dt voltage transients

Package: 24-pin QSOP (suffix LF)

Approximate footprint

DESCRIPTION

The Allegro™ ACS726 current sensor IC family provides economical and precise solutions for AC current sensing in industrial, commercial, and communications systems. The device package allows for easy implementation by the customer. Typical applications include motor control, load detection and management, switched-mode power supplies, and overcurrent fault protection.

The fully differential output gives superior immunity to output offset drift as well common mode noise.

ACS726 is the first current sensor IC to include a fully differential back-end amplifier (BEA) that can be used to adjust gain and bandwidth via external RC networks. The BEA is fully independent and when unused, it can be powered down to reduce power consumption.

The device consists of a precise, low-offset, linear Hall sensor circuit with a copper conduction path located near the surface of the die. Applied current flowing through this copper conduction path generates a magnetic field which is sensed by the integrated Hall IC and converted into a proportional voltage. Device accuracy is optimized through proximity of the magnetic field to the Hall transducer. A precise, proportional

Continued on the next page...

Typical Application

Current sensor IC gain can be set using R_{FB} and R_{IN}

FEATURES AND BENEFITS (continued)

- 3 to 3.6 V, single supply operation
- Factory-trimmed sensitivity and quiescent output voltage for improved accuracy
- Chopper stabilization results in extremely stable quiescent output voltage
- Ratiometric output from supply voltage

DESCRIPTION (continued)

voltage is provided by the low-offset, chopper-stabilized BiCMOS Hall IC, which is programmed for accuracy after packaging. The output of the device has a positive differential voltage ($V_{OUTP} - V_{OUTN}$) when an increasing current flows through the primary copper conduction path (from pins 1 through 6, to pins 7 through 12), which is the path used for current sensing. The internal resistance of this conductive path is 1.1 m Ω typical, providing low power loss.

The terminals of the conductive path are electrically isolated from the sensor IC signal leads (pins 13 through 24). This allows the ACS726 current sensor IC to be used in high-side current sense applications without the use of high-side differential amplifiers or other costly isolation techniques.

The ACS726 is provided in a small, low-profile surface mount QSOP24 package (suffix LF). The leadframe is plated with 100% matte tin, which is compatible with standard lead (Pb) free printed circuit board assembly processes. Internally, the device is Pb-free, except for flip-chip high-temperature Pb-based solder balls, currently exempt from RoHS. The device, excluding the BAE, is fully calibrated prior to shipment from the factory.

SELECTION GUIDE

| Part Number | Optimized Range for Sensed Current, I_P (A) | Linear Range for Sensed Current, I_P (A) | Sensitivity, Sens (Typ) (mV/A) [1] | Operating Ambient Temperature Range T_A , (°C) | Packing [2] |
|-----------------------|---|--|------------------------------------|--|--|
| ACS726LLFTR-40B-T [3] | ±40 | ±40 | 50 | -40 to 150 | Tape and reel, 2500 pieces per 13-in. reel |

[1] Measured differently when $V_{CC} = 3.3$ V and using a 2000 mV dynamic range.

[2] Contact Allegro™ for additional packing options.

[3] Variant not intended for automotive applications.

ABSOLUTE MAXIMUM RATINGS

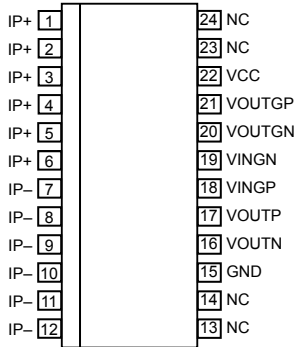

| Characteristic | Symbol | Notes | Rating | Unit |
|--------------------------------|--------------------------|--|------------|------------------|
| Supply Voltage | V_{CC} | VCC pin | 6 | V |
| Reverse Supply Voltage | V_{RCC} | VCC pin | -0.1 | V |
| Output Voltage | V_{OUTP}, V_{OUTN} | VOUTP and VOUTN pins | 6 | V |
| Reverse Output Voltage | V_{ROUTP}, V_{ROUTN} | VOUTP and VOUTN pins | -0.1 | V |
| BEA Input Voltage | V_{INGP}, V_{INGIN} | VINGP and VINGIN pins | 6 | V |
| BEA Reverse Input Voltage | V_{RINGP}, V_{RINGN} | VINGP and VINGN pins | -0.1 | V |
| BEA Output Voltage | V_{OUTGP}, V_{OUTGN} | VOUTGP and VOUTGN pins | 6 | V |
| BEA Reverse Output Voltage | V_{ROUTGP}, V_{ROUTGN} | VOUTGP and VOUTGN pins | -0.1 | V |
| Output Source Current | $I_{OUT(SOURCE)}$ | VOUTP, VOUTN, VOUTGP, VOUTGN pins to GND | 3 | mA |
| Output Sink Current | $I_{OUT(SINK)}$ | VCC pin to VOUTP, VOUTN, VOUTGP, VOUTGN | 10 | mA |
| Electric Strength Test Voltage | V_{ESTV} | Between pins 1-12 and 13-24; 60 Hz, 1 minute (Agency Type Test), $T_A = 25^\circ\text{C}$ | 2100 | VAC |
| Working Voltage | $V_{working}$ | For single protection according to UL 1577 standard; for higher continuous voltage ratings, please contact Allegro | 277 | VAC |
| | | | 391 | V_{pk} or VDC |
| Operating Ambient Temperature | T_A | Range L | -40 to 150 | $^\circ\text{C}$ |
| Maximum Junction Temperature | $T_J(\text{max})$ | | 165 | $^\circ\text{C}$ |
| Storage Temperature | T_{stg} | | -65 to 170 | $^\circ\text{C}$ |

THERMAL CHARACTERISTICS: May require derating at maximum conditions; see application information

| Characteristic | Symbol | Test Conditions* | Value | Unit |
|--|-----------------|---|-------|--------------------|
| Package Thermal Resistance (Junction to Ambient) | $R_{\theta JA}$ | On Allegro ACS726 evaluation board (expected value) | 27 | $^\circ\text{C/W}$ |

*Additional thermal information available on the Allegro website.

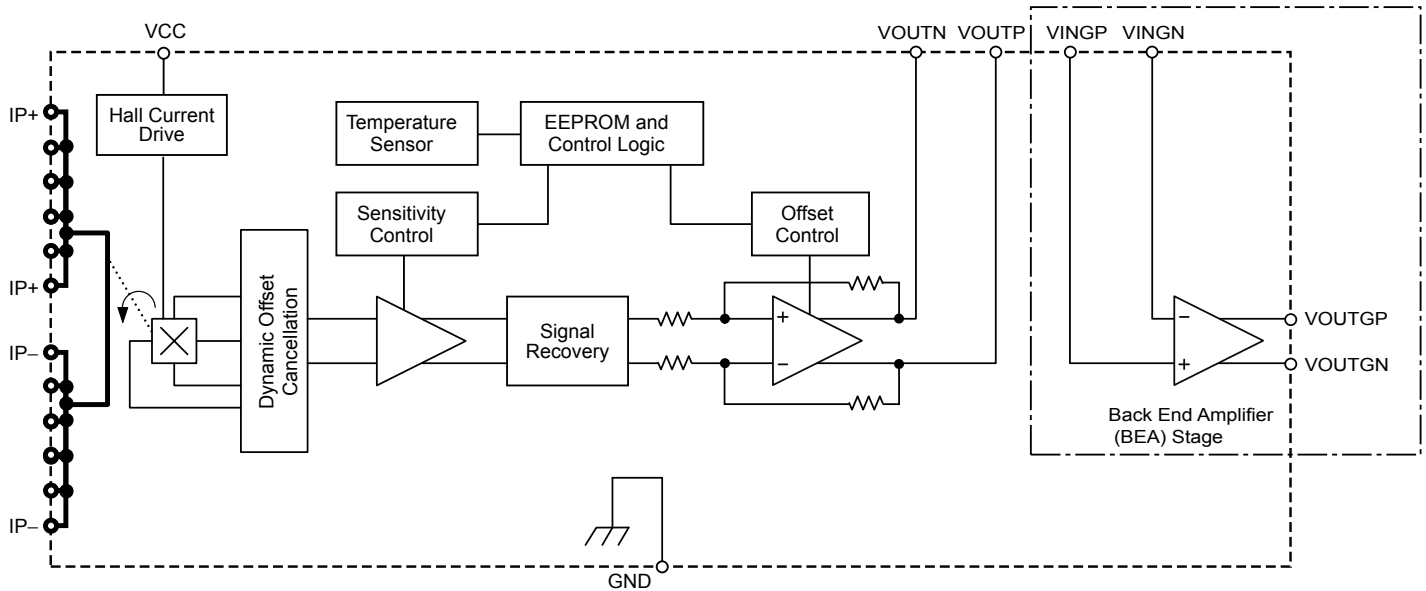

PINOUT DIAGRAM AND TERMINAL LIST TABLE

Package LF, 24-Pin QFN
Pin-out Diagram

Terminal List Table

| Number | Name | Function |
|--------------|--------|---|
| 1 through 6 | IP+ | Terminals for current being sensed; fused internally |
| 7 through 12 | IP- | Terminals for current being sensed; fused internally |
| 15 | GND | Signal ground terminal |
| 16 | VOUTN | Negative analog output |
| 17 | VOUTP | Positive analog output |
| 18 | VINGP | Gain stage positive analog input |
| 19 | VINGN | Gain stage negative analog input |
| 20 | VOUTGN | Gain stage negative analog output |
| 21 | VOUTGP | Gain stage positive analog output |
| 22 | VCC | Device power supply terminal |
| 13,14,23,24 | NC | No Connection; connect to GND for optimal ESD performance |

| Linearity | $\text{Err}_{\text{Lin}(\text{BEA})}$ | $G_{\text{CL}(\text{BEA})} = 2$, Over 2 V differential dynamic range | – | < ± 0.1 | – | % |

[1] If larger resistor values are used, settling time deteriorates. Adding a capacitor in parallel with the feedback resistor improves settling time.

[2] Allegro does not guarantee BAE performance and stability for Closed Loop Gain outside the recommended range.

[3] The Back End Amplifier can be powered-down by connecting VINGP and VINGN to GND, causing VOUTGP and VOUTGN to be = $V_{\text{CC}}/2$.

CHARACTERISTICS DEFINITIONS

Accuracy Characteristics

Differential Sensitivity ($Sens_{diff}$). The change in the differential sensor IC output ($V_{OUTP} - V_{OUTN}$) in response to a 1 A change through the primary conductor. The sensitivity is the product of the magnetic circuit sensitivity (G/A) (1 G = 0.1 mT) and the linear IC amplifier gain (mV/G). The linear IC amplifier gain is programmed at the factory to optimize the sensitivity (mV/A) for the full-scale current of the device.

Noise ($V_{NOISE(RMS)}$). The unfiltered output noise of the current sensor IC. Dividing the noise (mV) by the sensitivity (mV/A) provides the smallest current that the device is able to resolve.

Linearity Error (Err_{LIN})*. The ACS726 is designed to provide a linear output in response to a ramping current. Consider two current levels, I1 and I2. Ideally, the sensitivity of a device is the same for both currents, for a given supply voltage and temperature. Nonlinearity is present when there is a difference between the sensitivities measured at I1 and I2. Nonlinearity is calculated separately for the positive (Err_{LINpos}) and negative (Err_{LINneg}) applied currents as follows:

$$Err_{LINpos} = 100(\%) \times \left\{ 1 - \left(\frac{Sens_{IPOS2}}{Sens_{IPOS1}} \right) \right\}$$

$$Err_{LINneg} = 100(\%) \times \left\{ 1 - \left(\frac{Sens_{INEG2}}{Sens_{INEG1}} \right) \right\}$$

where:

$Sens_{Ix} = (V_{IOUTdiff(Ix)} - V_{IOUTdiff(Q)}) / Ix$ and $IPOSx$ and $INEGx$ are positive and negative currents. Then:

$$Err_{LIN} = \max(Err_{LINpos}, Err_{LINneg})$$

Differential Quiescent Output Voltage ($V_{IOUTdiff(Q)}$)*. The differential output of the sensor IC when the primary current is zero. It is nominally 0 V.

Differential Offset Voltage (V_{OE}). The deviation of the device output, from its ideal quiescent value of 0 V, due to nonmagnetic causes. To convert this voltage to amperes, divide by the device sensitivity, $Sens$.

Common Mode Output Voltage (V_{CMO}). The average of the positive and negative zero current output voltages: $(V_{OUTP(Q)} + V_{OUTN(Q)}) / 2$. V_{CMO} nominally equals $V_{CC} / 2$.

Common Mode Offset Voltage (V_{CMOE}). The deviation of the Common Mode Output Voltage from its ideal value of $V_{CC} / 2$.

Total Output Error (ETOT)*. The maximum deviation of the actual output from its ideal value, also referred to as accuracy, illustrated graphically in the Output voltage versus Sensed current chart.

ETOT is divided into four areas:

0 A at 25°C. Accuracy at the zero current flow at 25°C, without the effects of temperature.

0 A over Δ temperature. Accuracy at the zero current flow including temperature effects.

Full-scale current at 25°C. Accuracy at the full-scale current at 25°C, without the effects of temperature.

Full-scale current over Δ temperature. Accuracy at the fullscale current flow including temperature effects.

$$E_{TOT(IP)} = 100(\%) \times \left[\frac{(V_{IOUTdiff(IP)} - V_{IOUTdiff_IDEAL(IP)})}{Sens_{diff_IDEAL} \times IP} \right]$$

Where

$$V_{IOUTdiff_IDEAL(IP)} = V_{IOUTdiff_IDEAL(Q)} + (Sens_{diff_IDEAL} \times IP)$$

The Total Output Error incorporates all sources of error and is a function of I_p . At relatively high currents, E_{TOT} will be mostly due to sensitivity error, and at relatively low currents, E_{TOT} will be mostly due to Offset Voltage (V_{OE}). In fact, at $I_p = 0$, E_{TOT} approaches infinity due to the offset.

This is illustrated in the total output error versus sensed current chart.

Ratiometry. The ratiometric feature means that the Common Mode Output Voltage, V_{CMO} , and Differential Sensitivity, $Sens_{diff}$, are proportional to the supply voltage, V_{CC} . The following formula is used to derive the ratiometric change in common mode 0 A output voltage, ΔV_{CMORAT} (%).

$$100 \left(\frac{V_{CMO(VCC)} / V_{CMO(3.3V)}}{V_{CC} / 3.3 V} \right)$$

The ratiometric change in sensitivity, $\Delta Sens_{RAT}$ (%), is defined as:

$$100 \left(\frac{Sens_{diff(VCC)} / Sens_{diff(3.3V)}}{V_{CC} / 3.3 V} \right)$$

*Definitions of V_{IOUT} :

• $V_{IOUTdiff} = V_{OUTP} - V_{OUTN}$

• $V_{IOUTdiff(Q)} = V_{OUTP(Q)} - V_{OUTN(Q)}$; sensed current equals 0 A

Output Voltage versus Sensed Current
Total Output Error at 0 A and at Full-Scale Current

Total Output Error versus Sensed Current

Dynamic Response Characteristics

Power-On Time (t_{PO}). When the supply is ramped to its operating voltage, the device requires a finite time to power its internal components before responding to an input magnetic field. Power-On Time, t_{PO} , is defined as the time it takes for the output voltage to settle within $\pm 10\%$ of its steady state value when full scale I_P is applied, after the power supply has reached its minimum specified operating voltage, $V_{CC(min)}$, as shown in the chart at right.

Rise Time (t_r) The time interval between a) when the sensor IC differential output reaches 10% of its full scale value, and b) when it reaches 90% of its full scale value.

Propagation Delay (t_{pd}) The time interval between a) when the input current reaches 20% of its final value, and b) when the differential output reaches 20% of its final value.

Response Time ($t_{RESPONSE}$) The time interval between a) when the applied current reaches 90% of its final value, and b) when the sensor differential output reaches 90% of its final value corresponding to the applied current.

Power-On Time

Rise Time and Propagation Delay

PACKAGE OUTLINE DRAWING

For Reference Only – Not for Tooling Use

(Reference Allegro DWG-0000387, Rev. 2 and JEDEC MO-137 AE)
Dimensions in millimeters
Dimensions exclusive of mold flash, gate burrs, and dambar protrusions
Exact case and lead configuration at supplier discretion within limits shown

- Terminal #1 mark area
- Reference pad layout (reference IPC7351 SOP63P600X175-24M)
All pads a minimum of 0.20 mm from all adjacent pads; adjust as necessary to meet application process requirements and PCB layout tolerances
- Branding scale and appearance at supplier discretion
