

## 3.3V TO 18V MUX with Overcurrent Limit

Check for Samples: [TPS22980](#)

### FEATURES

- Powered From 3.3V
- 4.5V to 19.8V High Voltage Switch
- 3V to 3.6V Switch
- Adjustable Current Limit
- Thermal Shutdown
- Make Before Break Switch
- High Voltage Discharge Before Low Voltage Make
- Reverse Current Blocking

### APPLICATIONS

- Notebook Computers
- Desktop Computers
- Power Management Systems

### DESCRIPTION

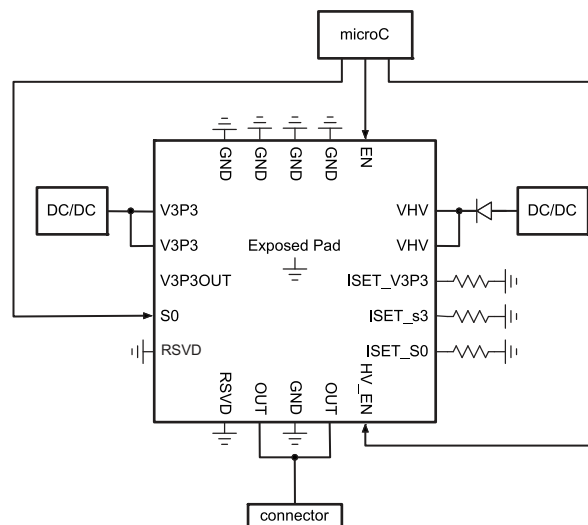

The TPS22980 is a current-limited power mux providing a connection to a peripheral device from either a low voltage supply (3.0V up to 3.6V) or a high voltage supply (5V up to 18V). The desired output is selected by digital control signals.

The high voltage (VHV) and low voltage (V3P3) switch current limits are set with external resistance. Once the current limit is reached, the TPS22980 will control the switch to maintain the current at the limit.

When the high voltage supply is not present, the TPS22980 will maintain the connection to the output from the low voltage supply. When a high voltage line and high voltage enable signal is detected by the device, the high voltage switch will be turned on in conjunction with the low voltage switch until a reverse current is detected by the low voltage switch. The low voltage switch is then disabled allowing a seamless transition from a low voltage to a high voltage supply with minimal drop and shoot-through current.

To prevent current backflow during a transition from a VHV connection to a V3P3 connection, the TPS22980 will break the VHV connection and discharge the output to approximately 3.3V. Once the output reaches 3.3V the device will connect V3P3 switch. If a load is present, the output will transition to 0V before returning to 3.3V.

The TPS22980 is available in a 4mm x 4mm x 1mm QFN package.

**Figure 1. Typical Application**

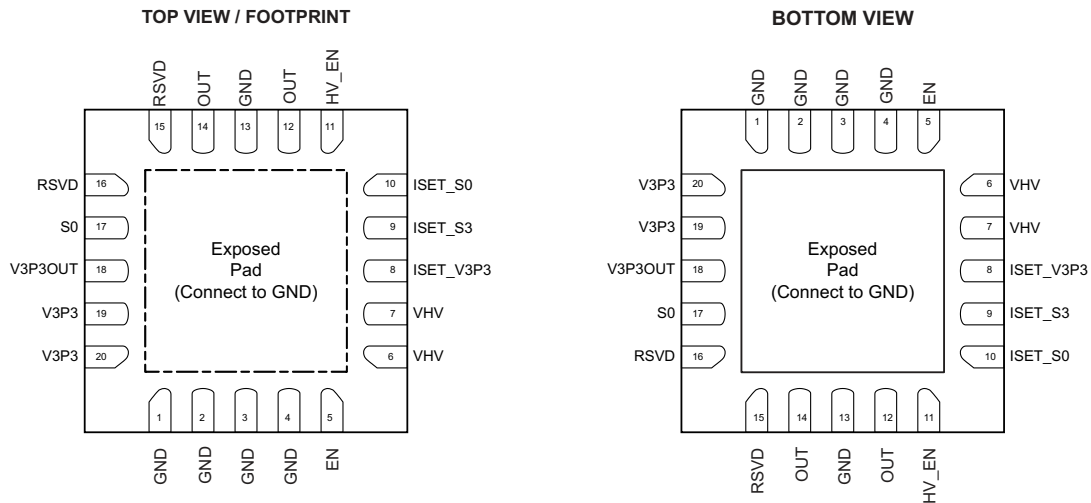

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

# TPS22980

SLVSB61C – DECEMBER 2011 – REVISED SEPTEMBER 2013

[www.ti.com](http://www.ti.com)

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Package Size: 4mm x 4mm x 1mm height, Pad Pitch: 0.5mm

## PIN FUNCTIONS

PIN		DESCRIPTION
NO.	NAME	
1	GND	Device ground
2		
3		
4		
5	EN	Device Enable.
6	VHV	High voltage power supply input. Place a minimum of 0.1µF capacitor as close to this pin as possible.
7		
8	ISET_V3P3	Sets the current limit for V3P3. Place resistor between this pin and GND. See <a href="#">Equation 1</a> to calculate resistor value.
9	ISET_S3	Sets the current limit for VHV in S3 mode. Place resistor between this pin and GND. See <a href="#">Equation 1</a> to calculate resistor value.
10	ISET_S0	Sets the current limit for VHV in S0 mode. Place resistor between this pin and GND. See <a href="#">Equation 1</a> to calculate resistor value.
11	HV_EN	High voltage output enable.
12, 14	OUT	Power output. Place a minimum of 1µF capacitor as close to this pin as possible.
13	GND	Device ground.
15	RSVD	Reserved. Must Tie to GND.
16		
17	S0	When this pin is asserted, the device is put in S0 mode. Otherwise the device operates in S3 mode.
18	V3P3OUT	3.3V bypass output. Place a minimum of 0.1µF capacitor as close to this pin as possible.
19	V3P3	3.3V power supply input. Place a minimum of 0.1µF capacitor as close to this pin as possible.
20		
EP	GND	

## ABSOLUTE MAXIMUM RATINGS

 over operating free-air temperature range (unless otherwise noted)<sup>(1) (2)</sup>

		VALUE	UNIT
V <sub>I</sub>	Input voltage range on V3P3 (VDD) <sup>(3)</sup>	–0.3 to 3.6	V
	Input voltage range on EN, HVEN, ISET_V3P3, ISET_S0, ISET_S3, S0 <sup>(3)</sup>	–0.3 to V3P3+0.3	
	Input voltage range on VHV <sup>(3)</sup>	–0.3 to 20	
	Output voltage range at OUT <sup>(3)</sup>	–0.3 to 20	
	Output voltage range at V3P3OUT <sup>(3)</sup>	–0.3 to V3P3+0.3	
T <sub>A</sub>	Operating ambient temperature range	–40 to 85	°C
T <sub>J (MAX)</sub>	Maximum operating junction temperature	110	°C
T <sub>stg</sub>	Storage temperature range	–65 to 150	°C
ESD Rating	Charge Device Model (JESD 22 C101)	500	V
	Human Body Model (JESD 22 A114)	2	kV

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.
- (2) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be de-rated. Maximum ambient temperature [T<sub>A(max)</sub>] is dependent on the maximum operating junction temperature [T<sub>J(max)</sub>], the maximum power dissipation of the device in the application [P<sub>D(max)</sub>], and the junction-to-ambient thermal resistance of the part/package in the application (θ<sub>JA</sub>), as given by the following equation: T<sub>A(max)</sub> = T<sub>J(max)</sub> – (θ<sub>JA</sub> × P<sub>D(max)</sub>)
- (3) All voltage values are with respect to network ground terminal.

## THERMAL INFORMATION

THERMAL METRIC <sup>(1)</sup>		TPS22980	UNITS
		RGP	
		16 PINS	
θ <sub>JA</sub>	Junction-to-ambient thermal resistance	38.9	°C/W

**FUNCTIONAL BLOCK DIAGRAM**

## APPLICATION INFORMATION

### CURRENT LIMIT

The TPS22980 provides current limiting in the power switches. Both the VHV supply current limit and the V3P3 supply current limit are adjustable by external resistors.

Figure 2 shows a simplified view of the TPS22980 current limit function. Both the VHV supply current limit and the V3P3 supply current limit are adjustable by external resistors.

Figure 2. Simplified Current Limit Diagram

The current limit thresholds,  $I_{REF\_HV}$  and  $I_{REF\_V3P3}$ , are set with three external resistors as shown in Figure 3. When the TPS22980 is passes the V3P3 voltage, the current limit is set by  $R_{ISET\_V3P3}$ . The VHV path has two modes that support two different current limits which are selected by the S0 pin. When S0 is asserted high,  $R_{ISET\_S0}$  sets the current limit. When S0 is low,  $R_{ISET\_S3}$  sets the current limit. This allows the system to have two separate VHV current limits for different modes such as active and sleep.

Figure 3. External  $R_{SET}$  Resistances to Set Current Limits

### CURRENT LIMIT THRESHOLD

Figure 4.  $I_{LIM}$  vs  $R_{SET}$  for VHV and V3P3

Figure 5. Percent Variance from min  $I_{LIM}$  vs  $R_{SET}$

Figure 4 shows the minimum, typical, and maximum current limit for either supply versus its corresponding  $R_{ISET}$  value. Equation 1 is used to determine the  $R_{ISET}$  needed to set a minimum  $I_{LIM}$  for a given supply and mode. Figure 5 shows the approximate variation from the set minimum  $I_{LIM}$  value to the typical and maximum  $I_{LIM}$  values.

$$R_{ISET} = \frac{40 \text{ k}\Omega \times \text{Amps}}{I_{LIMmin}} \quad (1)$$

where:

$R_{ISET}$  = external resistor used to set the current limit for V3P3, VHV (S0), or VHV (S3), and  
 $I_{LIMmin}$  = current limit for V3P3, VHV (S0), or VHV (S3) set by the external  $R_{ISET}$  resistor.

Each resistor is placed between the corresponding ISET pin and GND, as shown in Figure 3, providing a minimum current limit between 100mA and 1.5A.

## TRANSITION DELAYS

Output transitions of the TPS22980 voltages are shown in Figure 6. When the device transitions from VHV to V3P3 at the output, the power switches both turn off until the output falls to near the V3P3 voltage. During this time, a discharge current ( $I_{DIS}$ ) pulls OUT down. If a load on the line is also pulling OUT down, the output can drop to 0V due to the switch off time of T3P3OFF. Figure 7 shows the voltage drop on the output during this transition with no output capacitance.

**Figure 6. Allowable Voltage Transitions**

**Figure 7. Voltage Drop During Transitions from VHV**

## DIGITAL CONTROL SIGNALS

The voltage at OUT is controlled by two digital logic input signals, EN and HV\_EN. HV\_EN controls the state of the VHV switch and EN controls the state of V3P3 switch. [Table 1](#) lists the possible output states given the conditions of the digital logic signals. State PD indicates a pulldown resistance of  $R_{OUTDIS}$  to GND.

**Table 1. Output State of OUT Given the States EN and HV\_EN**

EN	HV_EN	OUT
0	0	PD
0	1	PD
1	0	V3P3
1	1	VHV

Figure 8 shows possible combinations of EN and HV\_EN controlling OUT of the TPS22980.

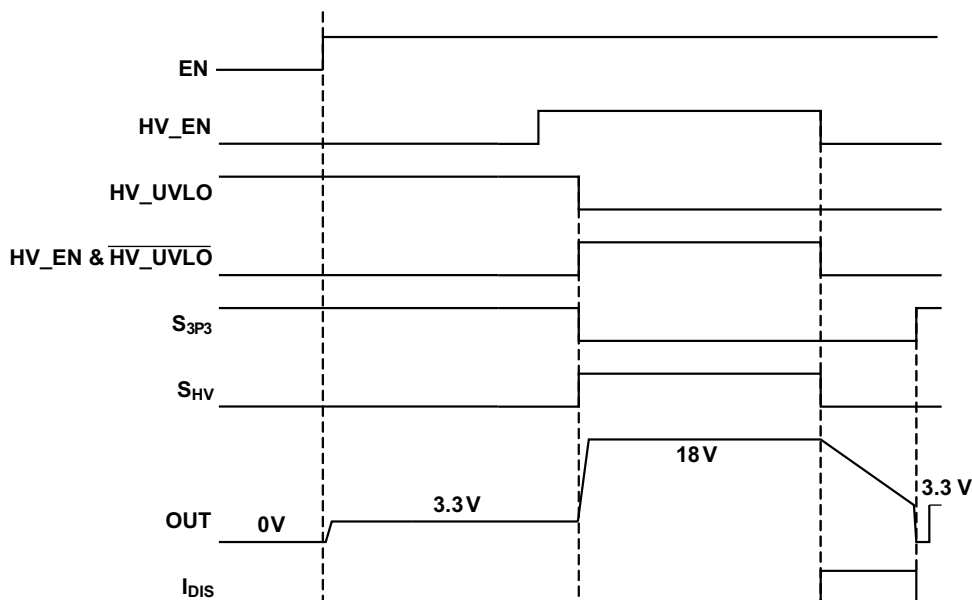

Figure 8. Logic Waveforms Displaying the Transition Between VHV and V3P3

### OVER-CURRENT LIMIT AND SHORT CIRCUIT PROTECTION

When the load at OUT attempts to draw more current than the limit set by the external RISE resistors for the V3P3 switch and VHV switch (for both S0 and S3 modes), the device will operate in a constant current mode while lowering the output voltage. Figure 9 shows the delay,  $t_{LIM}$ , which occurs when an over-current fault is detected until the output current is lowered to  $I_{LIMHV}$  tolerances for VHV or  $I_{LIM3V3}$  tolerances for V3P3 as shown in Figure 4.

Figure 9. Overcurrent Output Response

All short circuit conditions are treated as over-current conditions. In the event of a short circuit, the device will limit the output current to the corresponding  $R_{SET}$  value and continue to do so until thermal shutdown is encountered or the short circuit condition is removed.

## TPS22980

SLVSB61C – DECEMBER 2011 – REVISED SEPTEMBER 2013

www.ti.com

### Reverse Current Protection

Reverse current protection for the V3P3 supply to OUT triggers at  $I_{REV3P3}$  causing the V3P3 supply switch to open. When the HV\_EN signal is not asserted and reverse current protection is triggered, a discharge current source is turned on to bring the output voltage to 3.3V nominal.

### Thermal Shutdown

The device enters thermal shutdown when junction temperature reaches  $T_{SD}$ . The device will resume the previous state on power up once the junction temperature has dropped by 10°C. Connect thermal vias to the exposed GND pad underneath the device package for improved thermal diffusion.

### UVLO

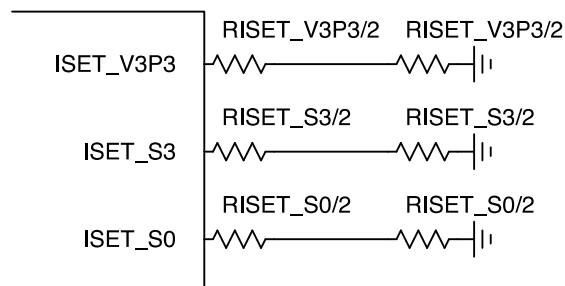

When the VHV rail reaches the under-voltage lockout threshold of  $V_{HVUVLO}$  while HV\_EN is high, the device will switch back to V3P3. Once the UVLO condition has cleared, the device will switch to VHV again. When the V3P3 rail reaches the under-voltage lockout threshold of  $V_{3P3UVLO}$ , regardless of the states of any digital logic controls, the device will open all switches and enter a reset condition.

### Input Inductive Bounce at Short Circuit

When the TPS22980 is operating at high currents and high input voltage on VHV, a short circuit condition can cause the input to exceed the maximum safe operating condition for VHV. When a significant inductance is present at the VHV input, sudden turn off of current through the device may produce a large enough inductive voltage bounce that exceeds the maximum safe operating condition and may damage the TPS22980. To prevent this, reduce any inductance at the input. Input capacitors, such as 4.7µF, can reduce the supply bounce and are recommended.

### Single Point Failure Protection

The TPS22980 current limits are set by the R<sub>ISSET</sub> resistances. Shorting one of these resistance would result in a single point failure that removes the current limiter for that particular input and mode. Without current limiting, an excessive current load may damage the TPS22980 and the system. To prevent a single point failure from occurring, the R<sub>ISSET</sub> resistances can be divided into two series resistances each as shown in [Figure 10](#). Failure of a single resistance will not result in runaway current and damage.

**Figure 10. R<sub>ISSET</sub> Division to Prevent Single Point Failure**

## REVISION HISTORY

<b>Changes from Original (December 2011) to Revision A</b>	<b>Page</b>
• Changed Typical Application figure. ....	1
• Added bottom view pin out information. ....	2
• Updated Pin Functions Table. ....	2
• Added reverse current and thermal shutdown parameters to the ELECTRICAL CHARACTERISTICS table. ....	4
• Updated the APPLICATION INFORMATION section. ....	6
<hr/>	
<b>Changes from Revision A (February 2012) to Revision B</b>	<b>Page</b>
• Changed bottom view pin out information. ....	2
<hr/>	
<b>Changes from Revision B (April 2012) to Revision C</b>	<b>Page</b>
• Removed ordering information table. ....	2
• Added R <sub>OUTDIS</sub> parameter to the Electrical Characteristics table. ....	4
• Updated the DIGITAL CONTROL SIGNALS section. ....	8

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS22980RGPR	ACTIVE	QFN	RGP	20	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	PS22980	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
