

MAX686 Evaluation Kit

Evaluates: MAX686

General Description

The MAX686 evaluation kit (EV kit) is a fully assembled and tested surface-mount circuit board that contains two separate switching-regulator circuits. The first circuit converts a +0.8V to +18V battery voltage to a +18V LCD bias voltage for currents up to 20mA. The second circuit converts a +0.8V to +12V battery voltage to a -17V voltage for currents up to 20mA.

The MAX686 requires a +2.7V to +5.5V supply at VIN, but the inductor can be powered from as low as +0.8V. The device features an internal N-channel MOSFET switch, programmable current limit, and internal 6-bit DAC for digital adjustment of the output voltage. The MAX686 EV kit provides low quiescent current and high efficiency for maximum battery life. Operation up to 300kHz allows the use of a tiny surface-mount inductor.

Ordering Information

PART	TEMP. RANGE	IC PACKAGE
MAX686EVKIT	0°C to +70°C	16 QSOP

Features

- ◆ **Output Voltage:**
 - +18V Typical Positive Output (or +12.6V to +24V adjustable with up/down)
 - 17V Typical Negative Output (or -22.7V to -11.4V adjustable with up/down)
- ◆ **Battery Input Voltage:**
 - +0.8V to +18V (Positive Output)
 - +0.8V to +12V (Negative Output)
- ◆ **+2.7V to +5.5V VIN Supply Range**
- ◆ **Up to 20mA Output Current**
- ◆ **6-Bit DAC-Controlled Output Voltage**
- ◆ **Internal 0.5A, 28V N-Channel Switch**
- ◆ **1.3µA IC Shutdown Current**
- ◆ **Up to 300kHz Switching Frequency**
- ◆ **Surface-Mount Components**
- ◆ **Fully Assembled and Tested**

Component List

DESIGNATION	QTY	DESCRIPTION
C1, C8	2	15µF, 35V tantalum capacitors AVX TPSD156M035R0300 or Sprague 593D156X0035E2W

Note: Please indicate that you are using the MAX686 when contacting these component suppliers.

Quick Start

The MAX686 EV kit is fully assembled and tested. Follow these steps to verify board operation. VIN and VBATT are separated on each circuit to demonstrate operation of VBATT down to +0.8V. VIN and VBATT can be connected together and to a single supply from +2.7V to +5.5V via jumpers JU3 and JU6. **Do not turn on the power supply until all connections are completed.**

Positive Output

- 1) Connect a +2.7V to +5.5V supply to the VIN pad, and connect a +0.8V to +18V supply to the VBATT pad. Connect the grounds to the GND pads.
- 2) Connect a voltmeter and load, if any, to the VOUT pad.
- 3) Place the shunt on JU1 across pins 2 and 3.
- 4) Turn on the power supplies and verify that the output voltage is typically +18V.

Negative Output

- 1) Connect a +2.7V to +5.5V supply to the VIN pad, and connect a +0.8V to +12V supply to the VBATT pad. Connect the grounds to the GND pads.
- 2) Connect a voltmeter and load, if any, to the -VOUT pad.
- 3) Place the shunt on JU4 across pins 2 and 3.
- 4) Turn on the power supplies and verify that the output voltage is typically -17V.

For instructions on selecting the feedback resistors for other output voltages, refer to the *Setting the Output Voltage* section in the MAX686 data sheet.

Detailed Description

The MAX686 EV kit contains two separate switching-regulator circuits. The first circuit provides an +18V output for currents up to 20mA with 90% typical conversion efficiency. The second circuit provides a -17V output voltage for currents up to 20mA with 82% typical conversion efficiency. Both output voltages can be adjusted with the internal 6-bit DAC. Each output can be controlled by logic signals applied to the UP/DN pads.

Output Voltage Control

The output voltage is set with the combination of a voltage divider and a summing resistor from DACOUT. The 6-bit DAC is controlled with an up/down counter via the UP and DN pins. This EV kit has the UP and DN pins connected to ground via 100kΩ resistors (R7, R8, R13, R14). On power-up, the output voltage is set to mid-scale. A rising edge on UP increases the output voltage; a rising edge on DN decreases the output voltage. Holding both UP and DN high resets the output voltage to mid-scale. Refer to the section *Setting the Output Voltage* in the MAX686 data sheet for more information on controlling the MAX686 output voltage.

Controlling the LCD Using POK and LCDON

$\overline{\text{LCDON}}$ can be used to turn on a positive LCD bias voltage when VBATT is above the desired threshold. A resistor-divider (R16-R17) from VBATT to POK controls the open-drain output $\overline{\text{LCDON}}$, which pulls low when $V_{\text{POK}} > 1.125\text{V}$.

$\overline{\text{LCDON}}$ can drive an external PNP transistor, Q1, switching a positive V_{OUT} to the LCD. The EV kit provides additional pads for Q1, R4, and R5. Choose a PNP with low saturation voltage at the required load current.

R4 limits the base current in Q1. R5 is used to turn off Q1 when $\overline{\text{LCDON}}$ is floating. R4 and R5 can be the same value. Refer to the section *Controlling the LCD Using POK and LCDON* in the MAX686 data sheet for instructions on selecting resistors R4, R5, R16, and R17.

Jumper Selection Shutdown Mode

The MAX686 EV kit features a shutdown mode that reduces the MAX686's quiescent current to 1.5 μ A (typical), preserving battery life. The 2-pin header JU1 selects the shutdown mode for the positive output, while JU4 selects the shutdown mode for the negative output. Tables 1 and 2 list the selectable jumper options.

Current Limit

The 2-pin header JU2 selects the current limit for the positive output circuit, while JU3 selects the current limit for the negative output. Table 3 lists the selectable jumper options. The MAX686 EV kit comes configured for a 500mA current limit.

**Table 1. Jumper JU1 Functions
(Positive Output)**

SHUNT LOCATION	SHDN PIN	MAX686 OUTPUT
1 & 2	Connected to GND	Shutdown mode $V_{OUT} = V_{BATT} - V_{DIODE}$
2 & 3	Connected to VIN	MAX686 enabled, $V_{OUT} = +18V$

**Table 2. Jumper JU4 Functions
(Negative Output)**

SHUNT LOCATION	SHDN PIN	MAX686 OUTPUT
1 & 2	Connected to GND	Shutdown mode, $V_{OUT} = 0V$
2 & 3	Connected to VIN	MAX686 enabled, $V_{OUT} = -17V$

Table 3. Jumpers JU2 and JU3 Functions

SHUNT LOCATION	ISET PIN	CURRENT LIMIT (mA)
On	Connected to GND	250
Off	Connected to VIN	500
