

Features

- 2-stage operational amplifier as filter
- Built-in noise rejection circuit
- On-chip regulator
- Override function
- Synchronous with AC 220V/50Hz and 110V/60Hz
- Pulse output (PT8A261) for TRIAC drive or level output (PT8A262) for relay drive
- CDS to enable/disable output
- Adjustable output on time duration
- ON/AUTO/OFF selectable by MODE pin
- Auto-reset if the ZC signal disappears over 3 seconds
- 40 seconds warm-up
- Quick check mode for initial installation
- Operating voltage: 5V
- Stand-by current: 80µA

General Description

The PT8A261 and PT8A262 are low power mixed signal CMOS LSI designed for the automatic lamp control using PIR sensor as motion detector.

With on chip noise filter and voltage regulator, the IC provides stable operations throughout temperature range. CDS input to disable day time operation is desired.

Applications

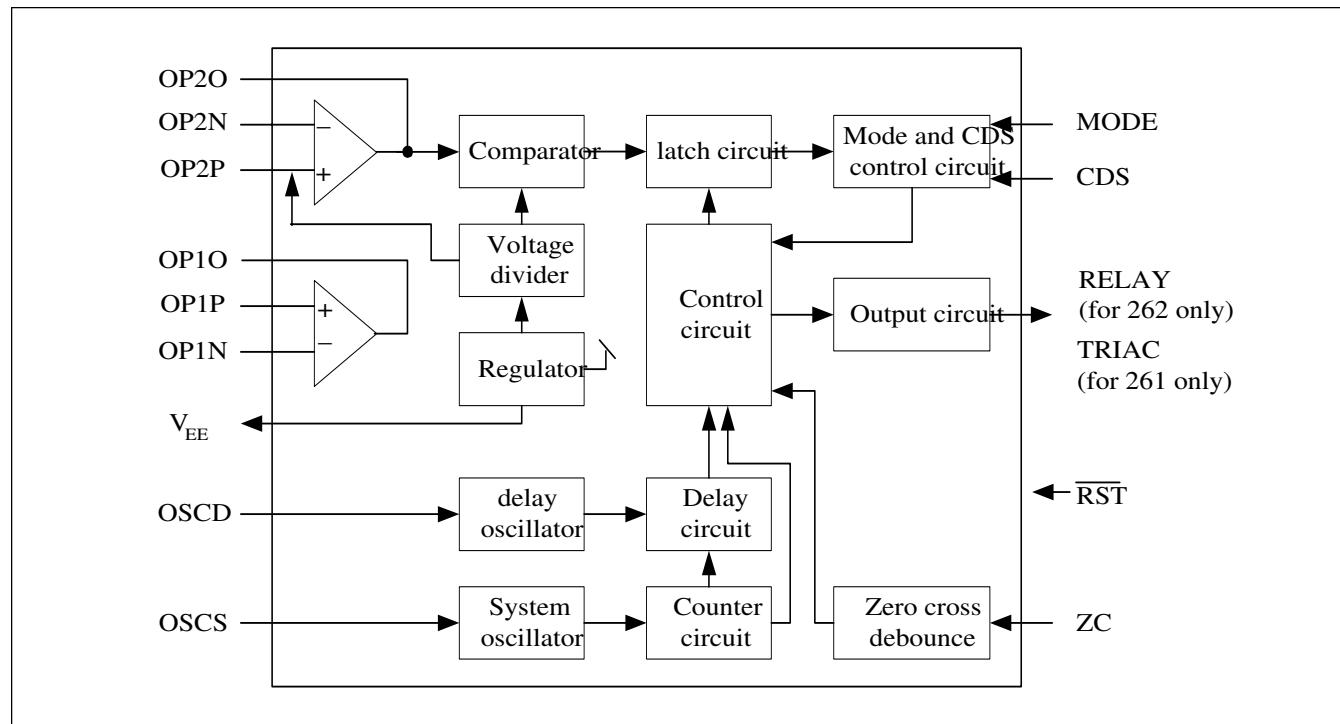

- Energy saving auto-switch in Garden, kitchen, bathroom, corridor, storage or yard
- Auto light in meeting room

Ordering Information

| Part Number | Package |
|-----------------------|--------------------------------------|
| PT8A261PE/PT8A262PE | Lead free 16 - Pin PDIP |
| PT8A261WE/PT8A262WE | Lead free and Green 16 - Pin SOIC |
| PT8A261DE / PT8A262DE | Die Form |

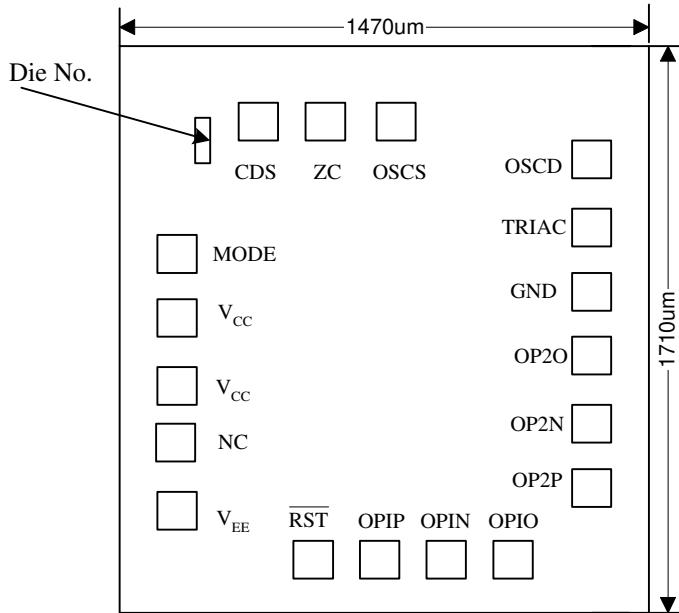

Note: Adding X suffix=Tape/Reel

Pin Description

Table 1

| Pin/Pad | | Name | Type | Description |
|---------|-----|------------------|--------|---|
| 261 | 262 | | | |
| 1 | 1 | GND | Ground | Ground |
| | 2 | RELAY | O | RELAY drive output through an external NPN transistor, active high |
| 2 | | TRIAC | O | TRIAC drive two-pulse output, active negative pulse. |
| 3 | 3 | OSCD | I/O | Output timing oscillator I/O, connected to an external RC to adjust output duration. |
| 4 | 4 | OSCS | I/O | System oscillator I/O, connected to an external RC to set the system frequency. The system frequency = 16kHz for normal application. |
| 5 | 5 | ZC | I | Schmitt input for AC zero crossing detection. |
| 6 | 6 | CDS | I | Connected to a CDS voltage divider for daytime/night auto-detection. Low input to this pin can disable PIR input. CDS is a schmitt trigger input with 5-second input debounce time. |
| 7 | 7 | MODE | I | Mode select, connecting to V _{CC} - output always on, connection GND - output always off, open - auto detection |
| 8 | 8 | V _{CC} | Power | Power supply |
| 9 | 9 | V _{EE} | O | Internal voltage regulator output, 3.6V with respect to ground. Connected to the drain of PIR sensor |
| 10 | 10 | \overline{RST} | I | Chip reset input, active low, kept floating or connected an RC network |
| 11 | 11 | OP1P | I | Non-inverted input of first operational amplifier, connected directly to source of PIR sensor |
| 12 | 12 | OP1N | I | Inverted input of first operational amplifier |
| 13 | 13 | OP1O | O | Output of first operational amplifier |
| 14 | 14 | OP2P | I | Non-inverted input of second operational amplifier. |
| 15 | 15 | OP2N | I | Inverted input of second operational amplifier |
| 16 | 16 | OP2O | O | Output of second operational amplifier |

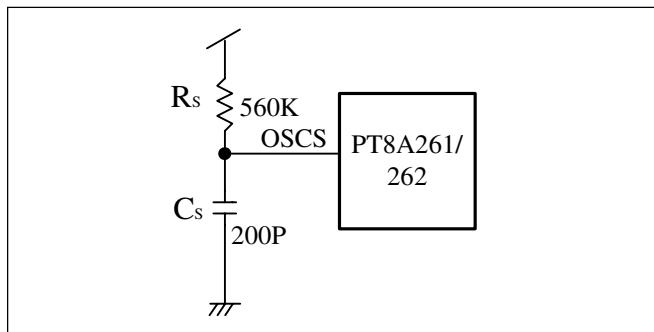

Functional Descriptions

The PT8A261 and PT8A262 are CMOS LSI chips designed for automatic PIR lamp control. They can operate in 2-wire configuration for triac applications or in 3-wire configuration for relay applications.

The device consists of operational amplifiers, a comparator, timer, a zero crossing detector, control circuit, a voltage regulator, a system oscillator, and an output timing oscillator.

The PIR sensor detects infrared power variations caused by motion of a human body and transfer to a voltage variation. If the PIR output voltage variation conforms to criteria, the lamp is turned on for an adjustable duration. The PT8A261 (or 262) offers three operating modes (ON, AUTO, OFF) which can be set through a MODE pin. When the device is working in AUTO mode, the user can override the mode to switch it to TEST mode or manual ON mode, or return to the AUTO mode by switching power switch.

Figure 3. System Oscillator

OSCS and OSCD Pins

OSCS is a system oscillator I/O pin connected to an external RC to generate system frequency of 16kHz.

OSCD is an output timing oscillator I/O pin. It's connected to an external RC to obtain the desired turn-on duration by selecting various values of RC or using a variable resistor. FoscD is the frequency of OSCD pin, output timing can be caculated as the formula: $T_D = 21504/F_{OSCD}$

CDS Input Circuit

CDS is a CMOS schmitt trigger input pin. It is used to distinguish between day time and night time. When the input voltage of CDS is high the PIR input is enabled, when CDS low the PIR input disabled. The input disable-to-enable debounce time is 5 seconds. Connect this pin to V_{CC} when not using it. The CDS input is ignored when the TRIAC or RELAY output is active.

Figure 4. Output Timing Oscillator

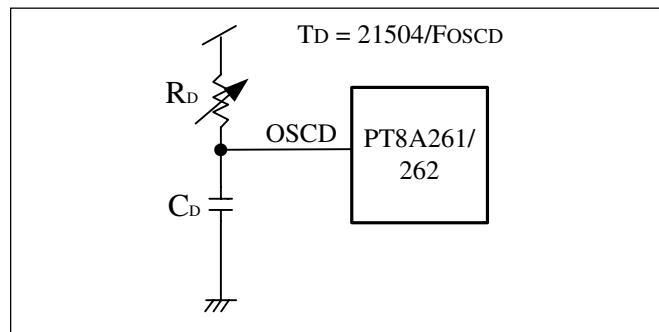

Figure 5. CDS Input Circuit

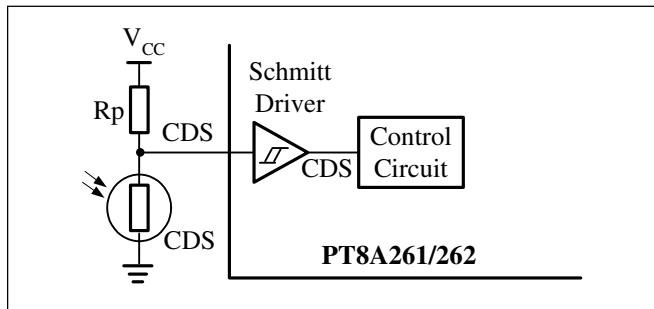

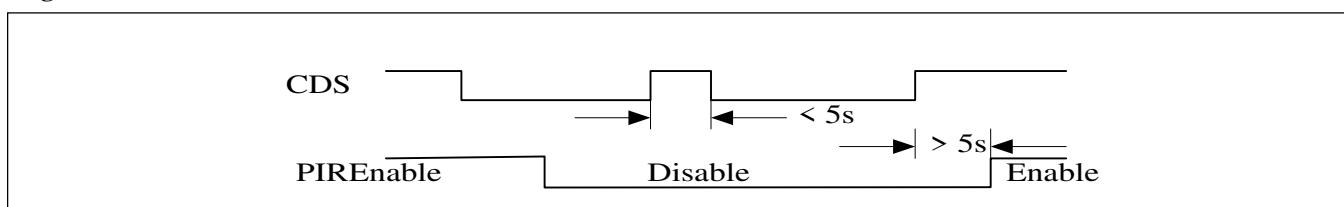

Table 2. CDS Pin Function

| CDS | Status | PIR |
|------|----------|----------|
| LOW | Day Time | Disabled |
| HIGH | Night | Enabled |

Figure 6. CDS Enable Debounce

MODE

MODE is a tri-state input pin for operation mode selection. See the following table 3.

Override Control: The term override refers to the change of operating mode by switching the power switch twice within 3 seconds. When the chip is working in the AUTO mode (MODE pin openned), the output is activated by a valid PIR trigger signal and the output active duration is controlled by the OSCD oscillation period. The lamp can be switched to ON from the AUTO mode by either switching the MODE pin to V_{CC} or switching the power switch twice within 3 seconds. The de-

vice can be toggled from ON to AUTO by switching the power switch twice within 3 seconds again (override operation).

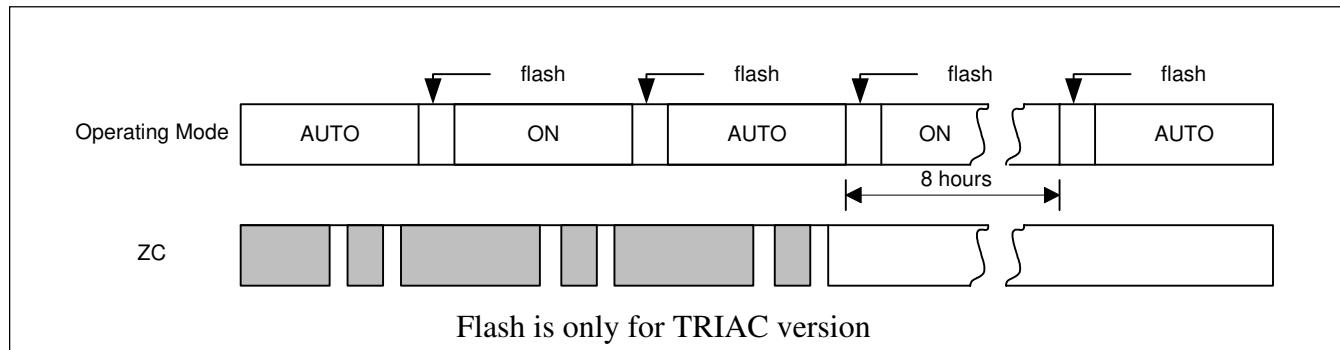

If the chip is overridden to ON and there is no further override operation, it will return to AUTO automatically after an internal preset ON time duration (8 hours).

The override operation will cause the lamp flash (for TRIAC version only). It will flash 3 times at 1Hz rate when changing AUTO mode to other mode, and flash 3 times at 2Hz rate when returning to AUTO mode. But no flash if mode is changed by switching the MODE switch. See Figure 7 for override timing.

Table 3. Operation Modes by MODE Pin

| MODE Status | Operation Mode | Description |
|-----------------|----------------|--|
| V _{CC} | ON | Output is always ON: RELAY pin sends high level for relay driving; TRIAC pulse train output is synchronized by ZC for triac driving. |
| GND | OFF | Output is always OFF: RELAY pin sends low level for relay driving; TRIAC pin sends high level for triac driving. |
| Open | AUTO | Outputs remain in the OFF state until activated by a valid PIR trigger input signal. When working in the AUTO mode, the device allows override control by switching the ZC signal. |

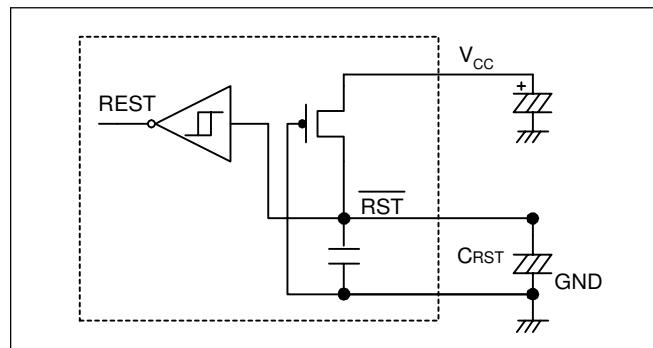

Figure 7. Override Timing

RST Pin

RST is used to reset the device. It is internal pull-high and active low. The use of C_{RST} can extend the power-on initial time. If the RST pin is opened (without CRST), the initial time is 40 seconds. See Figure 8.

Figure 8. RST Application Example

Power On Initial

The PIR signal amplifier requires a warm up period after power-on. The input should be disabled during this period.

In the AUTO mode within the first 10 seconds of the initial time the chip allows override control to enter the quickly install mode. After 40s of the initial time the chip allows override control between ON and AUTO. It will remain in the warm up period if the total initial time has not elapsed after returning to AUTO.

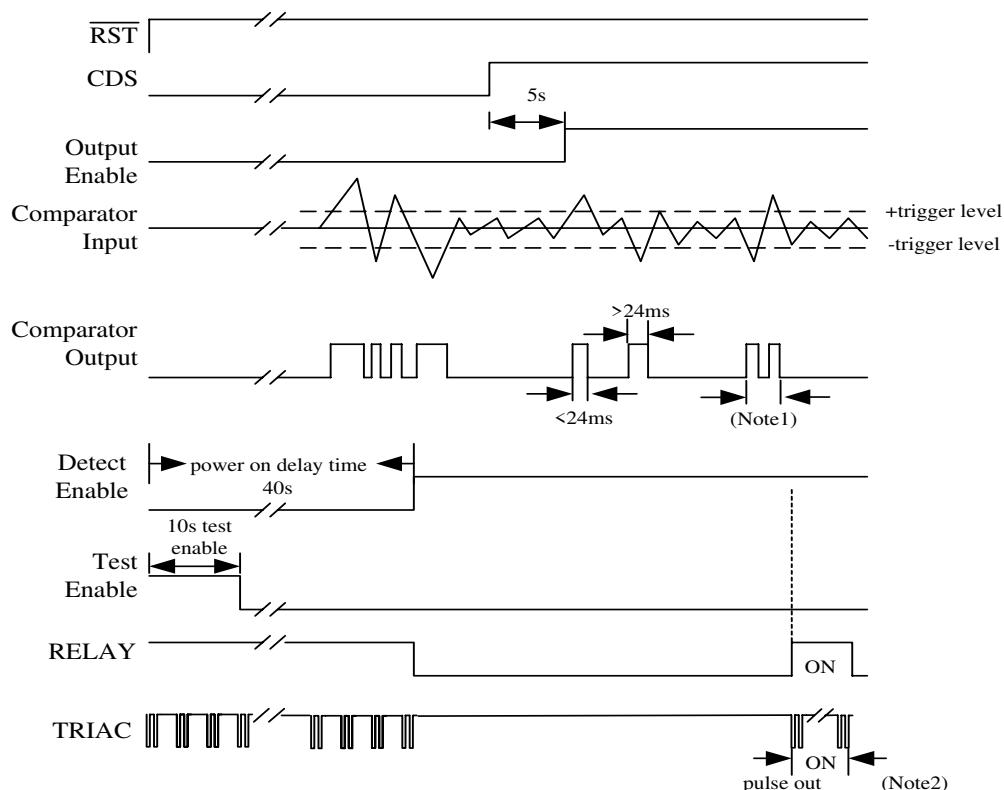

In case that the ZC signal disappears more than 3 seconds, the chip will restart the initialization operation. However, the restart initial time is always 40 seconds and cannot be extended by adding C_{RST} to the \overline{RST} pin as shown in Figure 6.

Trigger

The trigger timing is shown in Figure 9.

Retrigger -- If another signal is attained in trigger hold time, the circuit will be retriggered, and the trigger hold time will be restarted from this time.

Figure 9. Trigger Timing

- Notes:**
1. The output is activated if the trigger signal conforms to the following criteria:
 - More than 3 triggers within 2 seconds,
 - A trigger signal sustain duration ≥ 0.34 seconds, and
 - 2 triggers within 2 seconds with pulse duration of one ≥ 0.16 seconds.
 - The effective comparator output width is 24ms.(Fosc=16KHz)
 2. The output duration is set by an external RC connected to the OSCD pin.

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested)

| | |
|---|-----------------|
| Storage Temperature | -40°C to +125°C |
| Supply Voltage to Ground Potential (Inputs & V _{CC} Only) | -0.3 to +6.0V |
| Supply Voltage to Ground Potential (Outputs & D/O Only) | -0.3 to +6.0V |
| DC Input Voltage | -0.3 to +6.0V |
| DC Output Current | 20mA |
| Power Dissipation | 500mW |

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Recommended Operation Conditions

| Sym | Description | Min | Typ | Max | Units |
|-------------------|-------------------------------|--------------------|-----|--------------------|-------|
| V _{CC} | Supply Voltage | 4.75 | 5.0 | 6.0 | V |
| V _{IH} | Input HIGH Voltage (MODE,RST) | 0.8V _{CC} | - | - | V |
| V _{IL} | Input LOW Voltage (MODE,RST) | - | - | 0.2V _{CC} | V |
| f _{SYS} | System Oscillator Frequency | 12.8 | 16 | 19.2 | kHz |
| f _{bosc} | Delay Oscillator Frequency | 12.8 | 16 | 19.2 | kHz |
| T _A | Operation Temperature | -25 | 25 | 70 | °C |

DC Electrical Characteristics

| Sym | Description | Test Conditions | Min | Typ | Max | Units |
|------------------|--|------------------------|------|-----|-----|-------|
| I _{IH} | Input high level leakage current(ZC,CDS) | V _{IH} = 4.5V | -0.1 | - | 0.1 | µA |
| I _{IL} | Input low level leakage current(ZC,CDS) | V _{IL} = 0.5V | -0.1 | - | 0.1 | µA |
| I _{OH} | Output Source Current (RELAY, TRIAC) | V _{OH} = 4.5V | -6 | - | - | mA |
| I _{OL} | Output Sink Current (RELAY, TRIAC) | V _{OL} = 0.5V | 15 | - | - | mA |
| V _{TH1} | CDS Transfer High Voltage | | 3.0 | 3.2 | 3.6 | V |
| V _{TL1} | CDS Transfer Low Voltage | | 1.5 | 1.7 | 2.1 | V |
| V _{TH2} | ZC Transfer High Voltage | | 2.6 | 2.9 | 3.2 | V |
| V _{TL2} | ZC Transfer Low Voltage | | 1.0 | 1.4 | 1.6 | V |
| V _{TH3} | OSCS Transfer High Voltage | | 2.2 | 2.4 | 2.8 | V |
| V _{TL3} | OSCS Transfer Low Voltage | | 1.0 | 1.4 | 1.6 | V |
| V _{TH4} | OSCD Transfer High Voltage | | 2.2 | 2.4 | 2.8 | V |
| V _{TL4} | OSCD Transfer Low Voltage | | 0.4 | 0.6 | 0.8 | V |

Note: These specifications apply for V_{CC} = 5.0V and -25°C ≤ T_A ≤ 70°C, unless otherwise specified.

AC Electrical Characteristics

Voltage Regulator

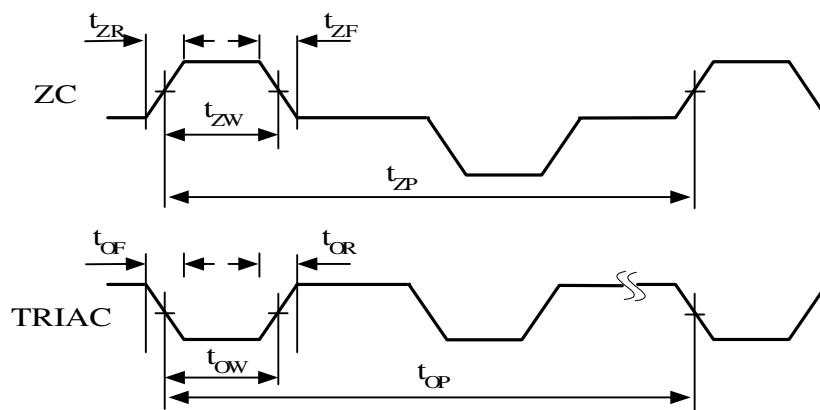

| Sym | Description | Test Conditions | Min | Typ | Max | Units |
|------------------|---------------------------|---|-----|-----|-----|-------|
| V_{EE} | Output Voltage | No load | 3.2 | 3.6 | 4.0 | V |
| V_{OP2P} | Noninverting input of OP2 | No load | 1.6 | 1.8 | 2.0 | V |
| ΔV_o | Line Regulation | $4.5V \leq V_{CC} \leq 5.5V, I_L = 1mA$ | - | 30 | 50 | mV |
| ΔV_{LDR} | Load Regulation | $V_{CC} = 5V, 0.5mA \leq I_L \leq 2mA$ | - | 60 | 100 | mV |
| I_L | Regulator Output Current | $V_{CC} = 5V$ | 4 | - | - | mA |

Operational Amplifier and Window Comparator

| Sym | Description | Test Conditions | Min | Typ | Max | Units |
|----------|------------------------------|-----------------|-----|------|-----|-------|
| BW | 3dB Bandwidth | - | 10 | - | - | kHz |
| V_{TH} | Windows Comparator Threshold | $V_{CC} = 5V$ | 1.9 | 2.05 | 2.2 | V |
| V_{TL} | | $V_{CC} = 5V$ | 1.4 | 1.55 | 1.7 | V |

Oscillator and ZC Input Pulse and Trigger Output Pulse

| Sym | Description | Test Conditions | Min | Typ | Max | Units |
|-----------|-----------------------|---|------|------|------|-------|
| f_{osc} | Oscillator Frequency | $V_{cc} = 5V, R_s = 560\Omega, C_s = 200pF$, see above fig 3 | 12.8 | 16 | 19.2 | kHz |
| t_{ZR} | ZC Pulse Rise Time | | - | 30 | 100 | ns |
| t_{ZF} | ZC Pulse Fall Time | | - | 30 | 100 | ns |
