CIPOS™

Control Integrated POver System

Dual In-Line Intelligent Power Module

Two Phase Switched Reluctance Drives 600V / 15A

Features

Dual In-Line molded module

- TRENCHSTOP™ IGBTs
- Rugged SOI gate driver technology with stability against transient and negative voltage
- Allowable negative VS potential up to -11V for signal transmission at VBS=15V
- Integrated bootstrap functionality
- Over current shutdown
- Temperature monitor
- Under-voltage lockout at all channels
- All of 4 switches turn off during protection
- Lead-free terminal plating; RoHS compliant
- Very low thermal resistance due to DCB

Target Applications

- Two phase switched reluctance drives

Description

The CIPOS™ module family offers the chance for integrating various power and control components to increase reliability, optimize PCB size and system costs.

It is designed to control two phase switched reluctance motors in variable speed drives for applications like a vacuum cleaner. The package concept is specially adapted to power applications, which need good thermal conduction and electrical isolation, but also EMI-save control and overload protection.

TRENCHSTOP™ IGBTs and diodes are combined with an optimized SOI gate driver for excellent electrical performance.

System Configuration

- Two phase switched reluctance drive with TRENCHSTOP™ IGBTs
- SOI gate driver
- Thermistor
- Pin-to-heatsink clearance distance typ. 1.6mm

Pin Description

HIN(A, B) and LIN(A, B) (IGBT control pins, Pin 7 - 10)

These pins are positive logic and they are responsible for the control of the integrated IGBT. The Schmitt-trigger input thresholds of them are such to guarantee LSTTL and CMOS compatibility down to 3.3V controller outputs. Pull-down resistor of about 5kΩ is internally provided to pre-bias inputs during supply start-up and a zener clamp is provided for pin protection purposes. Input Schmitt-trigger and noise filter provide beneficial noise rejection to short input pulses.

The noise filter suppresses control pulses which are below the filter time t_{FILIN} . The filter acts according to Figure 4.

Figure 3 Input pin structure

Figure 4 Input filter timing diagram

It is not recommended for proper work to provide input pulse-width lower than 1µs.

VFO (Fault-output, Pin 12)

The VFO pin indicates a module failure in case of under voltage at pin VDD or in case of triggered over current detection at ITRIP. A pull-up resistor is externally required.

Figure 5 Internal circuit at pin VFO

NTC (Thermistor, Pin 15)

The NTC pin provides direct access to the thermistor, which is referenced to VSS. An external pull-up resistor connected to +5V ensures that the resulting voltage can be directly connected to the microcontroller.

ITRIP (Over current detection function, Pin 13)

CIPOS™ provides an over current detection function by connecting the ITRIP input with the motor current feedback. The ITRIP comparator threshold (typ. 0.47V) is referenced to VSS ground. An input noise filter (typ.: $t_{ITRIPMIN} = 530ns$) prevents the driver to detect false over-current events.

Over current detection generates a shutdown of all outputs of the gate driver after the shutdown propagation delay of typically 1000ns.

The fault-clear time is set to minimum 40µs.

VDD, VSS (Low side control supply and reference, Pin 11, 14)

VDD is the control supply and it provides power both to input logic and to output power stage. Input logic is referenced to VSS ground.

The under-voltage circuit enables the device to operate at power on when a supply voltage of at least a typical voltage of $V_{DDUV+} = 12.1V$ is present.

The IC shuts down all the gate drivers power outputs, when the VDD supply voltage is below $V_{DDUV-} = 10.4V$. This prevents the external power switches from critically low gate voltage levels during on-state and therefore from excessive power dissipation.

VB(A, B) and VS(A, B) (High side supplies, Pin 3 - 6)

VB to VS is the high side supply voltage. The high side circuit can float with respect to VSS following the external high side power device emitter voltage.

Due to the low power consumption, the floating driver stage is supplied by integrated bootstrap circuit.

The under-voltage detection operates with a rising supply threshold of typical $V_{BSUV+} = 12.1V$ and a falling threshold of $V_{BSUV-} = 10.4V$.

VS(U, V, W) provide a high robustness against negative voltage in respect of VSS of -50V transiently. This ensures very stable designs even under rough conditions.

NL (IGBT emitter, Pin 17)

The low side IGBT emitters are available for current measurements. It is recommended to keep the connection to pin VSS as short as possible in order to avoid unnecessary inductive voltage drops.

NH (Diode anode, Pin 18)

The low side anodes of the integrated diodes are connected.

P (Positive bus input voltage, Pin 23)

The high side IGBTs are connected to the bus voltage. It is noted that the bus voltage does not exceed 450V.

Absolute Maximum Ratings
