

CS2100-OTP

Fractional-N Clock Multiplier

Features

- Clock Multiplier / Jitter Reduction
	- Generates a Low Jitter 6 75 MHz Clock from a Jittery or Intermittent 50 Hz to 30 MHz Clock Source
- Highly Accurate PLL Multiplication Factor
	- Maximum Error Less Than 1 PPM in High-Resolution Mode
- One-Time Programmability
	- Configurable Hardware Control Pins
	- Configurable Auxiliary Output
- Flexible Sourcing of Reference Clock
	- External Oscillator or Clock Source
	- Supports Inexpensive Local Crystal
- Minimal Board Space Required
	- No External Analog Loop-filter **Components**

General Description

The CS2100-OTP is an extremely versatile system clocking device that utilizes a programmable phase lock loop. The CS2100-OTP is based on a hybrid analogdigital PLL architecture comprised of a unique combination of a Delta-Sigma Fractional-N Frequency Synthesizer and a Digital PLL. This architecture allows for generation of a low-jitter clock relative to an external noisy synchronization clock with frequencies as low as 50 Hz. The CS2100-OTP has many configuration options which are set once prior to runtime. At runtime there are three hardware configuration pins available for mode and feature selection.

The CS2100-OTP is available in a 10-pin MSOP package in Commercial (-10°C to +70°C) and Automotive-D $(-40^{\circ}$ C to $+85^{\circ}$ C) and Automotive-E $(-40^{\circ}$ C to $+105^{\circ}$ C) grades. Customer development kits are also available for custom device prototyping, small production programming, and device evaluation. Please see "Ordering" Information["] on page 26 for complete details.

1. PIN DESCRIPTION

2. TYPICAL CONNECTION DIAGRAM

Figure 1. Typical Connection Diagram

3. CHARACTERISTICS AND SPECIFICATIONS

RECOMMENDED OPERATING CONDITIONS

 $GND = 0$ V; all voltages with respect to ground. (Note 1)

- **Notes:** 1. Device functionality is not guaranteed or implied outside of these limits. Operation outside of these limits may adversely affect device reliability.
	- 2. CLK_IN must not be applied when these conditions are not met, including during power up. See section 5.9 on page 19 for required power up procedure.

ABSOLUTE MAXIMUM RATINGS

GND = 0 V; all voltages with respect to ground.

WARNING: Operation at or beyond these limits may result in permanent damage to the device.

Notes: 3. The maximum over/under voltage is limited by the input current except on the power supply pin.

DC ELECTRICAL CHARACTERISTICS

Test Conditions (unless otherwise specified): VD = 3.1 V to 3.5 V; T_A = -10°C to +70°C (Commercial Grade); T_A = -40°C to +85°C (Automotive-D Grade); T_A = -40°C to +105°C (Automotive-E Grade).

Notes: 4. To calculate the additional current consumption due to loading (per output pin), multiply clock output frequency by load capacitance and power supply voltage. For example, $f_{CLK\text{ OUT}}$ (49.152 MHz) * C_L (15 pF) * VD (3.3 V) = 2.4 mA of additional current due to these loading conditions on CLK_OUT.

AC ELECTRICAL CHARACTERISTICS

Test Conditions (unless otherwise specified): VD = 3.1 V to 3.5 V; T_A = -10°C to +70°C (Commercial Grade); T_A = -40°C to +85°C (Automotive-D Grade); T_A = -40°C to +105°C (Automotive-E Grade); C_L = 15 pF.

Notes: 5. 1 UI (unit interval) corresponds to t_{SYS} CLK or 1/f_{SYS} CLK.

- 6. $f_{CLK\text{ OUT}}$ is ratio-limited when $f_{CLK\text{ IN}}$ is below 72 Hz.
- 7. $f_{CLK\text{ OUT}} = 24.576 \text{ MHz}$; Sample size = 10,000 points; $AuxOutSrc[1:0] = 11$.
- 8. In accordance with AES-12id-2006 section 3.4.2. Measurements are Time Interval Error taken with 3rd order 100 Hz to 40 kHz bandpass filter.
- 9. In accordance with AES-12id-2006 section 3.4.1. Measurements are Time Interval Error taken with 3rd order 100 Hz Highpass filter.
- 10. 1 UI (unit interval) corresponds to t_{CLK_N} or $1/f_{CLK_N}$.
- 11. The frequency accuracy of the PLL clock output is directly proportional to the frequency accuracy of the reference clock.

PLL PERFORMANCE PLOTS

Test Conditions (unless otherwise specified): VD = 3.3 V; T_A = 25 °C; C_L = 15 pF; f_{CLK_OUT} = 12.288 MHz; $f_{CLK IN}$ = 12.288 MHz; Sample size = 10,000 points; Base Band Jitter (100 Hz to 40 kHz); *AuxOutSrc[1:0]* = 11.

Figure 4. CLK_IN Random Jitter Rejection and Tolerance

4. ARCHITECTURE OVERVIEW

4.1 Delta-Sigma Fractional-N Frequency Synthesizer

The core of the CS2100 is a Delta-Sigma Fractional-N Frequency Synthesizer which has very high-resolution for Input/Output clock ratios, low phase noise, very wide range of output frequencies and the ability to quickly tune to a new frequency. In very simplistic terms, the Fractional-N Frequency Synthesizer multiplies the Timing Reference Clock by the value of N to generate the PLL output clock. The desired output to input clock ratio is the value of N that is applied to the delta-sigma modulator (see Figure 5).

The analog PLL based frequency synthesizer uses a low-jitter timing reference clock as a time and phase reference for the internal voltage controlled oscillator (VCO). The phase comparator compares the fractional-N divided clock with the original timing reference and generates a control signal. The control signal is filtered by the internal loop filter to generate the VCOís control voltage which sets its output frequency. The delta-sigma modulator modulates the loop integer divide ratio to get the desired fractional ratio between the reference clock and the VCO output (thus the duty cycle of the modulator sets the fractional value). This allows the design to be optimized for very fast lock times for a wide range of output frequencies without the need for external filter components. As with any Fractional-N Frequency Synthesizer the timing reference clock should be stable and jitter-free.

Figure 5. Delta-Sigma Fractional-N Frequency Synthesizer

4.2 Hybrid Analog-Digital Phase Locked Loop

The addition of the Digital PLL and Fractional-N Logic (shown in Figure 6) to the Fractional-N Frequency Synthesizer creates the Hybrid Analog-Digital Phase Locked Loop with many advantages over classical analog PLL techniques. These advantages include the ability to operate over extremely wide frequency ranges without the need to change external loop filter components while maintaining impressive jitter reduction performance. In the Hybrid architecture, the Digital PLL calculates the ratio of the PLL output clock to the frequency reference and compares that to the desired ratio. The digital logic generates a value of N which is then applied to the Fractional-N frequency synthesizer to generate the desired PLL output frequency. Notice that the frequency and phase of the timing reference signal do not affect the output of the PLL since the digital control loop will correct for the PLL output. A major advantage of the Digital PLL is the ease with which the loop filter bandwidth can be altered. The PLL bandwidth is set to a wide-bandwidth mode to quickly achieve lock and then reduced for optimal jitter rejection.

Delta-Sigma Fractional-N Frequency Synthesizer

Figure 6. Hybrid Analog-Digital PLL

5. APPLICATIONS

5.1 One Time Programmability

The one time programmable (OTP) circuitry in the CS2100-OTP allows for pre-configuration of the device prior to use in a system. There are two types of parameters that are used for device pre-configuration: *modal* and *global*. The *modal* parameters are features which, when grouped together, create a modal configuration set (see Figure 16 on page 20). Up to four modal configuration sets can be permanently stored and then dynamically selected using the M[1:0] mode select pins (see Table 1). The *global* parameters are the remaining configuration settings which do not change with the mode select pins. The modal and global parameters can be pre-set at the factory or user programmed using the customer development kit, CDK2000; Please see "Programming Information" on page 24 for more details.

5.2 Timing Reference Clock Input

The low jitter timing reference clock (RefClk) can be provided by either an external reference clock or an external crystal in conjunction with the internal oscillator. In order to maintain a stable and low-jitter PLL output the timing reference clock must also be stable and low-jitter; the quality of the timing reference clock directly affects the performance of the PLL and hence the quality of the PLL output.

5.2.1 Internal Timing Reference Clock Divider

The Internal Timing Reference Clock (SysClk) is limited to a lower maximum frequency than that allowed on the XTI/REF_CLK pin. The CS2100-OTP supports the wider external frequency range by offering an internal divider for RefClk. The *RefClkDiv[1:0]* global parameter should be configured such that SysClk, the divided RefClk, then falls within the valid range as indicated in "AC Electrical Characteristics" on page 7.

Figure 7. Internal Timing Reference Clock Divider

It should be noted that the maximum allowable input frequency of the XTI/REF_CLK pin is dependent upon its configuration as either a crystal connection or external clock input. See the "AC Electrical Characteristics" on page 7 for more details.

For the lowest possible output jitter, attention should be paid to the absolute frequency of the Timing Reference Clock relative to the PLL Output frequency (CLK_OUT). To minimize output jitter, the Timing Reference Clock frequency should be chosen such that f_{RefClk} is at least +/-15 kHz from $f_{CLK-OUT}^*N/32$ where N is an integer. Figure 8 shows the effect of varying the RefClk frequency around f_{CLK} _{OUT}*N/32. It should be noted that there will be a jitter null at the zero point when $N = 32$ (not shown in Figure 8). An

example of how to determine the range of RefClk frequencies around 12 MHz to be used in order to achieve the lowest jitter PLL output at a frequency of 12.288 MHz is as follows:

Referenced Control Parameter Definition RefClkDiv[1:0]"Reference Clock Input Divider (RefClkDiv[1:0])" on page 21

5.2.2 Crystal Connections (XTI and XTO)

An external crystal may be used to generate RefClk. To accomplish this, a 20 pF fundamental mode parallel resonant crystal must be connected between the XTI and XTO pins as shown in Figure 9. As shown, nothing other than the crystal and its load capacitors should be connected to XTI and XTO. Please refer to the "AC Electrical Characteristics" on page 7 for the allowed crystal frequency range.

Figure 9. External Component Requirements for Crystal Circuit

5.2.3 External Reference Clock (REF_CLK)

For operation with an externally generated REF_CLK signal, XTI/REF_CLK should be connected to the reference clock source and XTO should be left unconnected or terminated through a 47 k Ω resistor to GND.

5.3 Frequency Reference Clock Input, CLK_IN

The frequency reference clock input (CLK_IN) is used by the Digital PLL and Fractional-N Logic block to dynamically generate a fractional-N value for the Frequency Synthesizer (see "Hybrid Analog-Digital PLL" on page 10). The Digital PLL first compares the CLK_IN frequency to the PLL output. The Fractional-N logic block then translates the desired ratio based off of CLK IN to one based off of the internal timing reference clock (SysClk). This allows the low-jitter timing reference clock to be used as the clock which the Frequency

Synthesizer multiplies while maintaining synchronicity with the frequency reference clock through the Digital PLL. The allowable frequency range for CLK IN is found in the "AC Electrical Characteristics" on page 7.

5.3.1 Adjusting the Minimum Loop Bandwidth for CLK_IN

The CS2100 allows the minimum loop bandwidth of the Digital PLL to be adjusted between 1 Hz and 128 Hz using the *ClkIn_BW[2:0]* global parameter. The minimum loop bandwidth of the Digital PLL directly affects the jitter transfer function; specifically, jitter frequencies below the loop bandwidth corner are passed from the PLL input directly to the PLL output without attenuation. In some applications it is desirable to have a very low minimum loop bandwidth to reject very low jitter frequencies, commonly referred to as wander. In others it may be preferable to remove only higher frequency jitter, allowing the input wander to pass through the PLL without attenuation.

Typically, applications in which the PLL_OUT signal creates a new clock domain from which all other system clocks and associated data are derived will benefit from the maximum jitter and wander rejection of the lowest PLL bandwidth setting. See Figure 10.

Figure 10. Low bandwidth and new clock domain

Systems in which some clocks and data are derived from the PLL OUT signal while other clocks and data are derived from the CLK. IN signal will often require phase alignment of all the clocks and data in the system. See Figure 11. If there is substantial wander on the CLK IN signal in these applications, it may be necessary to increase the minimum loop bandwidth allowing this wander to pass through to the CLK OUT signal in order to maintain phase alignment. For these applications, it is advised to experiment with the loop bandwidth settings and choose the lowest bandwidth setting that does not produce system timing errors due to wandering between the clocks and data synchronous to the CLK IN domain and those synchronous to the PLL_OUT domain.

Figure 11. High bandwidth with CLK_IN domain re-use

While acquiring lock, the digital loop bandwidth is automatically set to a large value. Once lock is achieved, the digital loop bandwidth will settle to the minimum value selected by the *ClkIn_BW[2:0]* parameter.

5.4 Output to Input Frequency Ratio Configuration

5.4.1 User Defined Ratio (R_{IID})

The User Defined Ratio, R_{UD} , is a 32-bit un-signed fixed-point number which determines the basis for the desired input to output clock ratio. Up to four different ratios, *Ratio₀₋₃*, can be stored in the CS2100's one time programmable memory. Selection between the four ratios is achieved by the M[1:0] mode select pins. The 32-bit R_{UD} can be expressed in either a high resolution (12.20) or high multiplication (20.12) format selectable by the *LFRatioCfg* global parameter.

The R_{UD} for high resolution (12.20) format is encoded with 12 MSBs representing the integer binary portion with the remaining 20 LSBs representing the fractional binary portion. The maximum multiplication factor is approximately 4096 with a resolution of 0.954 PPM in this configuration. See "Calculating the User Defined Ratio" on page 23 for more information.

The R_{UD} for high multiplication (20.12) format is encoded with 20 MSBs representing the integer binary portion with the remaining 12 LSBs representing the fractional binary portion. In this configuration, the maximum multiplication factor is approximately 1,048,575 with a resolution of 244 PPM. It is recommended that the 12.20 High-Resolution format be utilized whenever the desired ratio is less than 4096 since the output frequency accuracy of the PLL is directly proportional to the accuracy of the timing reference clock and the resolution of the R_{UD} .

The status of internal dividers, such as the internal timing reference clock divider, are automatically taken into account. Therefore R_{UD} is simply the desired ratio of the output to input clock frequencies.

5.4.2 Ratio Modifier (R-Mod)

The Ratio Modifier is used to internally multiply/divide the currently addressed R_{UD} (*Ratio*₀₋₃ stored in the register space remain unchanged). The available options for R-Mod are summarized in Table 2 on page 15. R-Mod is enabled via the M2 pin in conjunction with the appropriate setting of the *M2Config[2:0]* global parameter (see Section 5.7.2 on page 18).

Table 2. Ratio Modifier

5.4.3 Effective Ratio (REFF)

The Effective Ratio (R_{EFF}) is an internal calculation comprised of R_{UD} and the appropriate modifiers, as previously described. R_{FFF} is calculated as follows:

$R_{\text{FFF}} = R_{\text{UD}} \bullet R$ -Mod

To simplify operation the device handles some of the ratio calculation functions automatically (such as when the internal timing reference clock divider is set). For this reason, the Effective Ratio does not need to be altered to account for internal dividers.

Ratio modifiers which would produce an overflow or truncation of R_{EFF} should not be used. In all cases, the maximum and minimum allowable values for R_{EFE} are dictated by the frequency limits for both the input and output clocks as shown in the "AC Electrical Characteristics" on page 7.

Selection of the user defined ratio from the four stored ratios is made by using the M[1:0] pins.

5.4.4 Ratio Configuration Summary

The R_{UD} is the user defined ratio for which up to four different values ($Ratio_{0-3}$) can be stored in the one time programmable memory. The M[1:0] pins then select the user defined ratio to be used as well as the modal configuration set. The resolution/format for the R_{UD} is selectable. R-Mod is applied accordingly. The user defined ratio, ratio modifier, and automatic ratio modifier make up the effective ratio R_{EFF} , the final calculation used to determine the output to input clock ratio. The effective ratio is then corrected for the internal dividers. The conceptual diagram in Figure 12 summarizes the features involved in the calculation of the ratio values used to generate the fractional-N value which controls the Frequency Synthesiz-

er. The subscript '4' indicates the modal parameters.

Figure 12. Ratio Feature Summary

5.5 PLL Clock Output

The PLL clock output pin (CLK_OUT) provides a buffered version of the output of the frequency synthesizer. The driver can be set to high-impedance with the M2 pin when the *M2Config[1:0]* global parameter is set to either 000 or 010. The output from the PLL automatically drives a static low condition while the PLL is unlocked (when the clock may be unreliable). This feature can be disabled by setting the *ClkOutUnl* global parameter, however the state CLK OUT may then be unreliable during an unlock condition.

5.6 Auxiliary Output

The auxiliary output pin (AUX OUT) can be mapped, as shown in Figure 14, to one of four signals: reference clock (RefClk), input clock (CLK_IN), additional PLL clock output (CLK_OUT), or a PLL lock indicator (Lock). The mux is controlled via the *AuxOutSrc[1:0]* modal parameter. If AUX_OUT is set to Lock, the *Aux-LockCfg* global parameter is then used to control the output driver type and polarity of the LOCK signal (see section 6.3.1 on page 21). In order to indicate an unlock condition, REF_CLK must be present. If AUX_OUT is set to CLK_OUT, the phase of the PLL Clock Output signal on AUX_OUT may differ from the CLK_OUT pin. The driver for the pin can be set to high-impedance using the M2 pin when the *M2Config[1:0]* global parameter is set to either 001 or 010.

Figure 14. Auxiliary Output Selection

5.7 Mode Pin Functionality

5.7.1 M1 and M0 Mode Pin Functionality

M[1:0] determine the functional mode of the device and select both the default User Defined Ratio and the set of modal parameters. The modal parameters are *RModSel[1:0]*, and *AuxOutSrc[1:0]*. By modifying one or more of the modal parameters between the 4 sets, different functional configurations can be achieved. However, global parameters are fixed and the same value will be applied to each functional configuration. Figure 16 on page 20 provides a summary of all parameters used by the device.

5.7.2 M2 Mode Pin Functionality

M2 usage is mapped to one of the optional special functions via the *M2Config[2:0]* global parameter. Depending on what M2 is mapped to, it will either act as an output enable/disable pin or override certain modal parameters. Figure 15 summarizes the available options and the following sections will describe each option in more detail.

5.7.2.1 M2 Configured as Output Disable

If *M2Config[2:0]* is set to either '000', '001', or '010', M2 becomes an output disable pin for one or both output pins. If M2 is driven 'low', the corresponding output(s) will be enabled, if M2 is driven 'high', the corresponding output(s) will be disabled.

5.7.2.2 M2 Configured as R-Mod Enable

If *M2Config[2:0]* is set to '011', M2 becomes the R-Mod enable pin. It should be noted that M2 is the only way to enable R-Mod. Even though the *RModSel[1:0]* modal parameter can be set arbitrarily for each configuration set, it will not take effect unless enabled via M2. If M2 is driven 'low', R-Mod will be disabled, if M2 is driven 'high' R-Mod will be enabled.

5.7.2.3 M2 Configured as AuxOutSrc Override

If *M2Config[2:0]* is set to '111', M2 when driven 'high' will override the *AuxOutSrc[1:0]* modal parameter and force the AUX_OUT source to PLL Clock Output. When M2 is driven 'low', AUX_OUT will function according to *AuxOutSrc[1:0]*.

5.8 Clock Output Stability Considerations

5.8.1 Output Switching

The CS2100-OTP is designed such that re-configuration of the clock routing functions do not result in a partial clock period on any of the active outputs (CLK_OUT and/or AUX_OUT). In particular, enabling or disabling an output, changing the auxiliary output source between REF_CLK and CLK_OUT, and the automatic disabling of the output(s) during unlock will not cause a runt or partial clock period.

The following exceptions/limitations exist:

- Enabling/disabling AUX OUT when $AuxOutSrc[1:0] = 11$ (unlock indicator).
- Switching *AuxOutSrc[1:0]* to or from 01 (CLK IN) and to or from 11 (unlock indicator) (Transitions between *AuxOutSrc[1:0]* = [00,10] will not produce a glitch).

When any of these exceptions occur, a partial clock period on the output may result.

5.8.2 PLL Unlock Conditions

Certain changes to the clock inputs and mode pins can cause the PLL to lose lock which will affect the presence of a clock signal on CLK_OUT. The following outlines which conditions cause the PLL to go unlocked:

- Any change in the state of the M1 and M0 pins will cause the PLL to temporarily lose lock as the new setting takes affect.
- Changes made to the state of the M2 when the *M2Config[2:0]* global parameter is set to 011, 100, 101, or 110 can cause the PLL to temporarily lose lock as the new setting takes affect.
- Any discontinuities on the Timing Reference Clock, REF_CLK.
- Discontinuities on the Frequency Reference Clock, CLK_IN.
- Gradual changes in CLK_IN frequency greater than ±30% from the starting frequency.
- Step changes in CLK IN frequency.

5.9 Required Power Up Sequencing for Programmed Devices

- Apply power. All input pins, except XTI/REF_CLK, should be held in a static logic hi or lo state until the DC Power Supply specification in the "Recommended Operating Conditions" table on page 6 are met.
- \cdot Apply input clock(s) if required.
- For CDK programmed devices, toggle the state of the M0, M1, or both pins at least 3 times to initialize the device. This must be done after the power supply is stable and before normal operation is expected. **Note:**This operation is not required for factory programmed devices.
- After the specified PLL lock time on page 7 has passed, the device will output the desired clock as configured by the M0-M2 pins.

6. PARAMETER DESCRIPTIONS

As mentioned in Section 5.1 on page 11, there are two different kinds of parameter configuration sets, Modal and Global. These configuration sets, shown in Figure 16, can be programmed in the field using the CDK2000 or preprogrammed at the factory. Please see "Programming Information" on page 24 for more details.

Figure 16. Parameter Configuration Sets

6.1 Modal Configuration Sets

There are four instances of each of these configuration parameters. Selection between the four stored sets is made using the M[1:0] pins.

6.1.1 R-Mod Selection (RModSel[1:0])

Selects the R-Mod value, which is used as a factor in determining the PLL's Fractional N.

Note: This parameter does not take affect unless M2 pin is high and the *M2Config[2:0]* global parameter is set to '011'.

6.1.2 Auxiliary Output Source Selection (AuxOutSrc[1:0])

Selects the source of the AUX_OUT signal.

Note: When set to 11, the *AuxLockCfg* global parameter sets the polarity and driver type ("AUX PLL Lock Output Configuration (AuxLockCfg)" on page 21).

6.2 Ratio 0 - 3

The four 32-bit User Defined Ratios are stored in the CS2100's one time programmable memory. See "Output to Input Frequency Ratio Configuration" on page 14 and "Calculating the User Defined Ratio" on page 23 for more details.

6.3 Global Configuration Parameters

6.3.1 AUX PLL Lock Output Configuration (AuxLockCfg)

When the AUX_OUT pin is configured as a lock indicator (*AuxOutSrc[1:0]* modal parameter = '11'), this global parameter configures the AUX_OUT driver to either push-pull or open drain. It also determines the polarity of the lock signal. If AUX_OUT is configured as a clock output, the state of this parameter is disregarded.

Note: AUX_OUT is an **un**lock indicator, signalling an error condition when the PLL is unlocked. Therefore, the pin polarity is defined relative to the **un**lock condition.

6.3.2 Reference Clock Input Divider (RefClkDiv[1:0])

Selects the input divider for the timing reference clock.

6.3.3 Enable PLL Clock Output on Unlock (ClkOutUnl)

Defines the state of the PLL output during the PLL unlock condition.

6.3.4 Low-Frequency Ratio Configuration (LFRatioCfg)

Determines how to interpret the currently indexed 32-bit User Defined Ratio.

6.3.5 M2 Pin Configuration (M2Config[2:0])

Controls which special function is mapped to the M2 pin.

6.3.6 Clock Input Bandwidth (ClkIn_BW[2:0])

Sets the minimum loop bandwidth when locked to CLK_IN.

7. CALCULATING THE USER DEFINED RATIO

Note: The software for use with the evaluation kit has built in tools to aid in calculating and converting the User Defined Ratio. This section is for those who would like to know more about how the User Defined Ratio is calculated and stored.

Most calculators do not interpret the fixed point binary representation which the CS2100-OTP uses to define the output to input clock ratio (see Section 5.4.1 on page 14); However, with a simple conversion we can use these tools to generate a binary or hex value for *Ratio*₀₋₃ to be stored in one time programmable memory. Please see "Programming Information" on page 24 for more details on programming.

7.1 High Resolution 12.20 Format

To calculate the User Defined Ratio (R_{UD}) to store in the register(s), divide the desired output clock frequency by the given input clock (CLK_IN). Then multiply the desired ratio by the scaling factor of 2^{20} to get the scaled decimal representation; then use the decimal to binary/hex conversion function on a calculator and write to the register. A few examples have been provided in Table 3.

Table 3. Example 12.20 R-Values

7.2 High Multiplication 20.12 Format

To calculate the User Defined Ratio (R_{UD}) to store in the register(s), divide the desired output clock frequency by the given input clock (CLK IN). Then multiply the desired ratio by the scaling factor of 2^{12} to get the scaled decimal representation; then use the decimal to binary/hex conversion function on a calculator and write to the register. A few examples have been provided in Table 4.

Table 4. Example 20.12 R-Values

8. PROGRAMMING INFORMATION

[Field programming of the CS2100-OTP is achieved using the hardware and software tools included with the](http://www.cirrus.com                      -1.0) [CDK2000. The software tools can be downloaded from w](http://www.cirrus.com           :  H��)i)ww.cirrus.com for evaluation prior to ordering a CDK. The CDK2000 is designed with built-in features to ease the process of programming small quantities of devices for prototype and small production builds. In addition to its field programming capabilities, the CDK2000 can also be used for the complete evaluation of programmed CS2100-OTP devices.

The CS2100-OTP can also be factory programmed for large quantity orders. When ordering factory programmed devices, the CDK should first be used to program and evaluate the desired configuration. When evaluation is complete, the CS2000 Configuration Wizard is used to generate a file containing all device configuration information; this file is conveyed to Cirrus Logic as a complete specification for the factory programming configuration. Please contact your local Cirrus Logic sales representative for more information regarding factory programmed parts.

See the CDK2000 datasheet, available at [www.cirrus.com](http://www.cirrus.com6   -    2  p), for detailed information on the use of the CDK2000 programming and evaluation tools.

Below is a form which represents the information required for programming a device (noted in gray). The "Parameter Descriptions" section beginning on page 20 describes the functions of each parameter. This form may be used either for personal notation for device configuration or it can be filled out and given to a Cirrus representative in conjunction with the programming file from the CDK2000 as an additional check. The User Defined Ratio may be filled out in decimal or it may be entered as hex as outlined in "Calculating the User Defined Ratio" on page 23. For all other parameters mark a '0' or '1' below the parameter name.

9. PACKAGE DIMENSIONS

10L MSOP (3 mm BODY) PACKAGE DRAWING (Note 1)

Notes: 1. Reference document: JEDEC MO-187

- 2. D does not include mold flash or protrusions which is 0.15 mm max. per side.
- 3. E1 does not include inter-lead flash or protrusions which is 0.15 mm max per side.
- 4. Dimension b does not include a total allowable dambar protrusion of 0.08 mm max.
- 5. Exceptions to JEDEC dimension.

THERMAL CHARACTERISTICS

10.ORDERING INFORMATION

The CS2100-OTP is ordered as an un-programmed device. The CS2100-OTP can also be factory programmed for large quantity orders. Please see "Programming Information" on page 24 for more details.

11.REVISION HISTORY

Important: Please check www.Cirrus.com to confirm that you are using the latest revision of this document and to determine whether there are errata associated with this device.

Contacting Cirrus Logic Support
