LM48861 Boomer® Audio Power Amplifier Series Ground-Referenced, Ultra Low Noise, Stereo Headphone Amplifier

Check for Samples: LM48861, LM48861TMBD

FEATURES

- **Ground Referenced Outputs – Eliminates Output Coupling Capacitors**
- **Common-Mode Sensing**
- **Advanced Click-and-Pop Suppression**
- **Low Supply Current**
- **Minimum External Components**
- **Micro-Power Shutdown**
- **ESD Protection of 8kV HBM Contact**
- **Available in Space-Saving 12-Bump DSBGA Package**

APPLICATIONS

- **Mobile Phones**
- **Portable Electronic Devices**
- **MP3 Players**

KEY SPECIFICATIONS

- **Output Power/Channel at V_{DD} = 1.5V,THD+N = 1%**
  - **R_L = 16Ω 12mW (typ)**
  - **R_L = 32Ω 13mW (typ)**
- **Output Power/Channel at V_{DD} = 1.8V, THD+N = 1%**
  - **R_L = 16Ω 24mW (typ)**
  - **R_L = 32Ω 22mW (typ)**
- **Quiescent Power Supply Current at 1.5V 2mA (typ)**
- **PSRR at 217Hz 83dB (typ)**
- **Shutdown Current 0.01µA (typ)**

DESCRIPTION

The LM48861 is a single supply, ground-referenced stereo headphone amplifier. Part of TI's PowerWise™ product family, the LM48861 consumes only 3mW of power, yet still provides great audio performance. The ground-referenced architecture eliminates the larger DC blocking capacitors required by traditional headphone amplifier's saving board space and reducing cost.

The LM48861 features common-mode sensing that corrects for any differences between the amplifier ground and the potential at the headphone return terminal, minimizing noise created by any ground mismatches.

The LM48861 delivers 22mW/channel into a 32Ω load with <1% THD+N with a 1.8V supply. Power supply requirements allow operation from 1.2V to 2.8V. High power supply rejection ratio (PSRR), 83dB at 217Hz, allows the device to operate in noisy environments without additional power supply conditioning. A low power shutdown mode reduces supply current consumption to 0.01µA.

Superior click and pop suppression eliminates audible transients on power-up/down and during shutdown. The LM48861 is available in an ultra-small 12-bump, 0.4mm pitch, DSBGA package (1.215mm x 1.615mm).

BUMP DESCRIPTION

Bump	Name	Description
A1	CPP	Charge Pump Flying Capacitor Positive Terminal
A2	PGND	Power Ground
A3	CPN	Charge Pump Flying Capacitor Negative Terminal
B1	V_{DD}	Positive Power Supply
B2	$\overline{SHDN}$	Active Low Shutdown
B3	CPV_{SS}	Charge Pump Output
C1	OUTL	Left Channel Output
C2	V_{SS}	Negative Power Supply
C3	INL	Left Channel Input
D1	OUTR	Right Channel Output
D2	COM	Ground reference for inputs and HP
D3	INR	Right Channel Input

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings(1)(2)(3)

Supply Voltage(1)		3V
Storage Temperature		−65°C to +150°C
Input Voltage		-0.3V to V_{DD} + 0.3V
Power Dissipation(4)		Internally Limited
ESD Ratings (HBM)(5)		2000V
ESD Ratings(OUTL, OUTR)(5)		8000V
ESD Susceptibility (Machine Model)(6)		200V
Junction Temperature		150°C
Thermal Resistance	θ_{JA} (YFQ)	70°C/W (typ)

(1) *"Absolute Maximum Ratings"* indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the *Absolute Maximum Ratings*Ratings or other conditions beyond those indicated in the *Recommended Operating Conditions* is not implied. The *Recommended Operating Conditions* indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified

(2) The *Electrical Characteristics* tables list ensured specifications under the listed *Recommended Operating Conditions* except as otherwise modified or specified by the *Electrical Characteristics Conditions* and/or Notes. Typical specifications are estimations only and are not ensured.

(3) If Military/Aerospace specified devices are required, please contact the TI Sales Office/ Distributors for availability and specifications.

(4) Maximum allowable power dissipation is $P_{DMAX} = (T_{JMAX} - T_A) / \theta_{JA}$ or the number given in *Absolute Maximum Ratings*, whichever is lower.

(5) Human body model, applicable std. JESD22-A114C.

(6) Machine model, applicable std. JESD22-A115-A.

Operating Ratings

Temperature Range $T_{MIN} \le T_A \le T_{MAX}$	$-40°C \le T_A \le +85°C$
Supply Voltage (V_{DD})	$1.2V \le V_{DD} \le 2.8V$

Electrical Characteristics V_{DD} = 1.5V[1][2]

The following specifications apply for V_{DD} = 1.5V, A_V = –1V/V, R_L = 32kΩ, f = 1kHz, unless otherwise specified. Limits apply for T_A = 25°C.

Symbol	Parameter	Conditions	LM48861		Units (Limits)
			Typical[3]	Limit[4]	
I_{DD}	Quiescent Power Supply Current	V_{IN} = 0V, Both channels enabled	2	2.8	mA (max)
I_{SD}	Shutdown Current	Shutdown Enabled $V_{\overline{SHDN}}$ = GND	0.01	1.5	µA (max)
V_{OS}	Output Offset Voltage	V_{IN} = 0V, R_L = 32Ω Both channels enabled	0.5	1.5	mV (max)

APPLICATION INFORMATION

GENERAL AMPLIFIER FUNCTION

The LM48861 headphone amplifier features TI's ground referenced architecture that eliminates the large DC-blocking capacitors required at the outputs of traditional headphone amplifiers. A low-noise inverting charge pump creates a negative supply (CPV_{SS}) from the positive supply voltage (V_{DD}). The headphone amplifiers operate from these bipolar supplies, with the amplifier outputs biased about GND, instead of a nominal DC voltage (typically $V_{DD}/2$), like traditional amplifiers. Because there is no DC component to the headphone output signals, the large DC-blocking capacitors (typically 220µF) are not necessary, conserving board space and system cost, while improving frequency response.

COMMON MODE SENSE

The LM48861 features a ground (common mode) sensing feature. In noisy applications, or where the headphone jack is used as a line out to other devices, noise pick up and ground imbalance can degrade audio quality. The LM48861 COM input senses and corrects any noise at the headphone return, or any ground imbalance between the headphone return and device ground, improving audio reproduction. Connect COM directly to the headphone return terminal of the headphone jack Figure 17. No additional external components are required. Connect COM to GND if the common-mode sense feature is not in use.

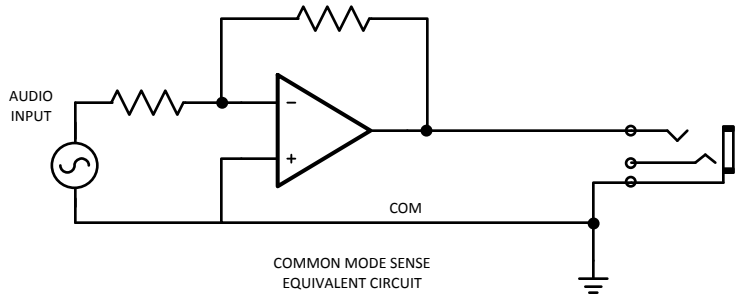

Figure 17.

MICRO POWER SHUTDOWN

The voltage applied to the shutdown ($\overline{SHDN}$) pin controls the LM48861's shutdown function. Activate micro-power shutdown by applying a logic-low voltage to the $\overline{SHDN}$ pin. When active, the LM48861's micro-power shutdown feature turns off the amplifier's bias circuitry, reducing the supply current. The trigger point is 0.4V (max) for a logic-low level, and 1.4V (min) for a logic-high level. The low 0.1µA (typ) shutdown current is achieved by applying a voltage that is as near as ground as possible to the $\overline{SHDN}$ pin. A voltage that is higher than ground may increase the shutdown current.

There are a few ways to control the micro-power shutdown. These include using a single-pole, single-throw switch, a microprocessor, or a microcontroller. When using a switch, connect an external 100kΩ pull-up resistor between the $\overline{SHDN}$ pin and GND. Connect the switch between the $\overline{SHDN}$ pin and V_{DD}. Select normal amplifier operation by closing the switch. Opening the switch connects the $\overline{SHDN}$ pin to ground, activating micro-power shutdown. The switch and resistor ensure that the $\overline{SHDN}$ pin will not float. This prevents unwanted state changes. In a system with a microprocessor or microcontroller, use a digital output to apply the control voltage to the $\overline{SHDN}$ pin. Driving the $\overline{SHDN}$ pin with active circuitry eliminates the pull-up resistor.

POWER DISSIPATION

Power dissipation is a major concern when using any power amplifier, especially one in mobile devices. In the LM48861, the power dissipation comes from the charge pump and two operational amplifiers. Refer to the Figure 10 Power Dissipation vs Output Power curve in the Typical Performance Characteristics section of the datasheet to find the power dissipation associated the output power level of the LM48861. The power dissipation should not exceed the maximum power dissipation point of the DSBGA package given in Equation 1.

$$P_{DMAX} = (T_{JMAX} - T_A) / (\theta_{JA}) \quad (1)$$

For the LM48861TM DSBGA package, θ_{JA} = 70°C/W. T_{JMAX} = 150°C, and T_A is the ambient temperature of the system surroundings.

PROPER SELECTION OF EXTERNAL COMPONENTS

Power Supply Bypassing/Filtering

Proper power supply bypassing is critical for low noise performance and high PSRR. Place the supply bypass capacitors as close to the supply pins as possible. Place a 1µF ceramic capacitor from V_{DD} to GND. Additional bulk capacitance may be added as required.

Charge Pump Capacitor Selection

Use low ESR ceramic capacitors (less than 100mΩ) for optimum performance.

Charge Pump Flying Capacitor (C5)

The flying capacitor (C5) affects the load regulation and output impedance of the charge pump. A C5 value that is too low results in a loss of current drive, leading to a loss of amplifier headroom. A higher valued C5 improves load regulation and lowers charge pump output impedance to an extent. Above 2.2µF, the $R_{DS(ON)}$ of the charge pump switches and the ESR of C5 and C6 dominate the output impedance. A lower value capacitor can be used in systems with low maximum output power requirements.

Charge Pump Hold Capacitor (C6)

The value and ESR of the hold capacitor (C6) directly affects the ripple on CPV_{SS}. Increasing the value of C6 reduces output ripple. Decreasing the ESR of C6 reduces both output ripple and charge pump output impedance. A lower value capacitor can be used in systems with low maximum output power requirements.

Power Supply Bypassing /Filtering

Proper power supply bypassing is critical for low noise performance and high PSRR. Place the supply bypass capacitors as close to the device as possible. Typical applications employ a voltage regulator with 10µF and 0.1µF bypass capacitors that increase supply stability. These capacitors do not eliminate the need for bypassing of the LM48861 supply pins. A 1µF capacitor is recommended.

Input Capacitor Selection

The LM48861 requires input coupling capacitors. Input capacitors block the DC component of the audio signal, eliminating any conflict between the DC component of the audio source and the bias voltage of the LM48861. The input capacitors create a high-pass filter with the input resistors R_{IN}. The -3dB point of the high-pass filter is found using Equation 2 below.

$$f = 1 / 2\pi R_{IN} C_{IN} \quad (2)$$

Where

- the value of R_{IN} is selected based on the gain-setting resistor selection.

In relation to Figure 1, R_{IN} = R1 = R2, C_{IN} = C1 = C2.

The input capacitors can also be used to remove low frequency content from the audio signal. Small speakers can not reproduce, and may even be damaged by low frequencies. High-pass filtering the audio signal helps protect the speakers. When the LM48861 is using a single-ended source, power supply noise on the ground is seen as an input signal. Setting the high-pass filter point above the power supply noise frequencies, 217Hz in a GSM phone, for example, filters out the noise such that it is not amplified and heard on the output. Capacitors with a tolerance of 10% or better are recommended for impedance matching and improved CMRR and PSRR.

PCB Layout Guidelines

Minimize trace impedance of the power, ground and all output traces for optimum performance. Voltage loss due to trace resistance between the LM48861 and the load results in decreased output power and efficiency. Trace resistance between the power supply and ground has the same effect as a poorly regulated supply, increased ripple and reduced peak output power. Use wide traces for power supply inputs and amplifier outputs to minimize losses due to trace resistance, as well as route heat away from the device. Proper grounding improves audio performance, minimizes crosstalk between channels and prevents switching noise from interfering with the audio signal. Use of power and ground planes is recommended.

As described in the Common Mode Sense section, the LM48861 features a ground sensing feature. On the PCB layout, connect the COM pin (pin D2) directly to the headphone jack ground and also to the left and right input grounds. This will help correct any noise or any ground imbalance between the headphone return, input, and the device ground, therefore improving audio reproduction.

The charge pump capacitors and traces connecting the capacitor to the device should be kept away from the input and output traces to avoid any switching noise injected into the input or output.

REVISION HISTORY

Rev	Date	Description
1.0	06/11/08	Initial release.
1.01	02/08/10	Input text edits.
B	05/02/2013	Changed layout of National Data Sheet to TI format.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM48861TM/NOPB	ACTIVE	DSBGA	YFQ	12	250	RoHS & Green	SNAGCU	Level-1-260C-UNLIM	-40 to 85	G K3	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
