MAX4249–MAX4257

UCSP, Single-Supply, Low-Noise, Low-Distortion, Rail-to-Rail Op Amps

General Description

The MAX4249–MAX4257 low-noise, low-distortion operational amplifiers offer rail-to-rail outputs and single-supply operation down to 2.4V. They draw 400µA of quiescent supply current per amplifier while featuring ultra-low distortion (0.002% THD), as well as low input voltage-noise density (7.9nV/√Hz) and low input current-noise density (0.5fA/√Hz). These features make the devices an ideal choice for portable/battery-powered applications that require low distortion and/or low noise.

For additional power conservation, the MAX4249/MAX4251/MAX4253/MAX4256 offer a low-power shutdown mode that reduces supply current to 0.5µA and puts the amplifiers' outputs into a high-impedance state. The MAX4249-MAX4257's outputs swing rail-to-rail and their input common-mode voltage range includes ground. The MAX4250–MAX4254 are unity-gain stable with a gain-bandwidth product of 3MHz. The MAX4249/MAX4255/MAX4256/MAX4257 are internally compensated for gains of 10V/V or greater with a gain-bandwidth product of 22MHz. The single MAX4250/MAX4255 are available in space-saving 5-pin SOT23 packages. The MAX4252 is available in an 8-bump chip-scale package (UCSP™) and the MAX4253 is available in a 10-bump UCSP. The MAX4250AAUK comes in a 5-pin SOT23 package and is specified for operation over the automotive (-40°C to +125°C) temperature range.

Applications

Wireless Communications Devices

PA Control

Portable/Battery-Powered Equipment

Medical Instrumentation

ADC Buffers

Digital Scales/Strain Gauges

Features

- **Available in Space-Saving UCSP, SOT23, and µMAX® Packages**
- **Low Distortion: 0.0002% THD (1kΩ load)**
- **400µA Quiescent Supply Current per Amplifier**
- **Single-Supply Operation from 2.4V to 5.5V**
- **Input Common-Mode Voltage Range Includes Ground**
- **Outputs Swing Within 8mV of Rails with a 10kΩ Load**
- **3MHz GBW Product, Unity-Gain Stable (MAX4250–MAX4254)**
  22MHz GBW Product, Stable with $A_V \geq$ 10V/V (MAX4249/MAX4255/MAX4256/MAX4257)
- **Excellent DC Characteristics**
  V_{OS} = 70µV
  I_{BIAS} = 1pA
  Large-Signal Voltage Gain = 116dB
- **Low-Power Shutdown Mode**
  Reduces Supply Current to 0.5µA
  Places Outputs in a High-Impedance State
- **400pF Capacitive-Load Handling Capability**

Detailed Description

The MAX4249–MAX4257 single-supply operational amplifiers feature ultra-low noise and distortion while consuming very little power. Their low distortion and low noise make them ideal for use as preamplifiers in wide dynamic-range applications, such as 16-bit analog-to-digital converters (see *Typical Operating Circuit*). Their high-input impedance and low noise are also useful for signal conditioning of high-impedance sources, such as piezoelectric transducers.

These devices have true rail-to-rail output operation, drive loads as low as 1kΩ while maintaining DC accuracy, and can drive capacitive loads up to 400pF without oscillation. The input common-mode voltage range extends from V_{DD} - 1.1V to 200mV beyond the negative rail. The push-pull output stage maintains excellent DC characteristics, while delivering up to ±5mA of current.

The MAX4250–4254 are unity-gain stable, whereas, the MAX4249/MAX4255/MAX4256/MAX4257 have a higher slew rate and are stable for gains ≥ 10V/V. The MAX4249/MAX4251/MAX4253/MAX4256 feature a low-power shutdown mode, which reduces the supply current to 0.5μA and disables the outputs.

The MAX4250AAUK is specified for operation over the automotive (-40°C to +125°C) temperature range.

Low Distortion

Many factors can affect the noise and distortion that the device contributes to the input signal. The following guidelines offer valuable information on the impact of design choices on Total Harmonic Distortion (THD).

Choosing proper feedback and gain resistor values for a particular application can be a very important factor in reducing THD. In general, the smaller the closed-loop gain, the smaller the THD generated, especially when driving heavy resistive loads. Large-value feedback resistors can significantly improve distortion. The THD of the part normally increases at approximately 20dB per decade, as a function of frequency. Operating the device near or above the full-power bandwidth significantly degrades distortion.

Referencing the load to either supply also improves the part's distortion performance, because only one of the MOSFETs of the push-pull output stage drives the output. Referencing the load to midsupply increases the part's distortion for a given load and feedback setting. (See the Total Harmonic Distortion vs. Frequency graph in the *Typical Operating Characteristics*.)

For gains ≥ 10V/V, the decompensated devices MAX4249/MAX4255/MAX4256/MAX4257 deliver the best distortion performance, since they have a higher slew rate and provide a higher amount of loop gain for a given closed-loop gain setting. Capacitive loads below 400pF, do not significantly affect distortion results. Distortion performance remains relatively constant over supply voltages.

Low Noise

The amplifier's input-referred, noise-voltage density is dominated by flicker noise at lower frequencies, and by thermal noise at higher frequencies. Because the thermal noise contribution is affected by the parallel combination of the feedback resistive network ($R_F \parallel R_G$, Figure 1), these resistors should be reduced in cases where the system bandwidth is large and thermal noise is dominant. This noise contribution factor decreases, however, with increasing gain settings.

For example, the input noise-voltage density of the circuit with R_F = 100kΩ, R_G = 11kΩ (A_V = 10V/V) is e_n = 15nV/√Hz, e_n can be reduced to 9nV/√Hz by choosing R_F = 10kΩ, R_G = 1.1kΩ (A_V = 10V/V), at the expense of greater current consumption and potentially higher distortion. For a gain of 100V/V with R_F = 100kΩ, R_G = 1.1kΩ, the e_n is low (9nV/√Hz).

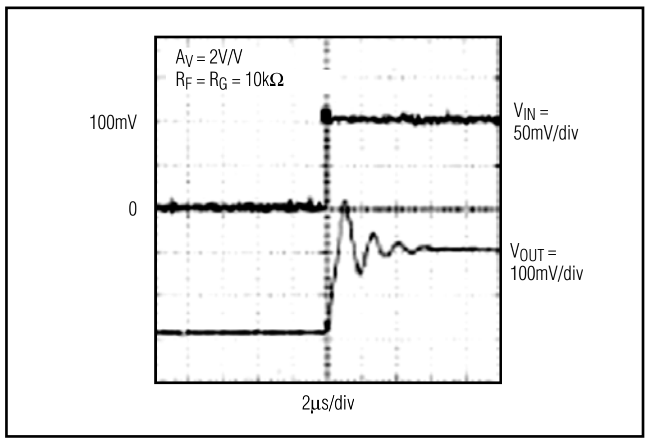

Figure 2a. Pulse Response with No Feed-Forward Compensation

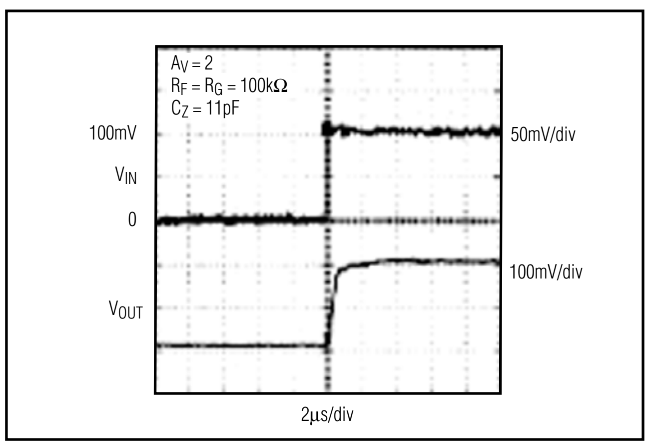

Figure 2b. Pulse Response with 10pF Feed-Forward Compensation

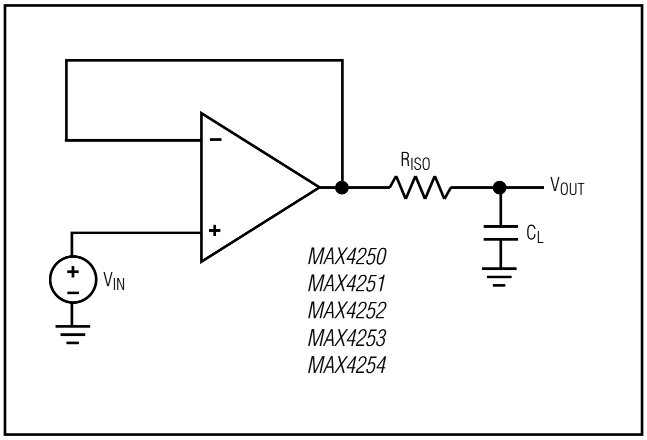

Figure 3. Overdriven Input Showing No Phase Reversal

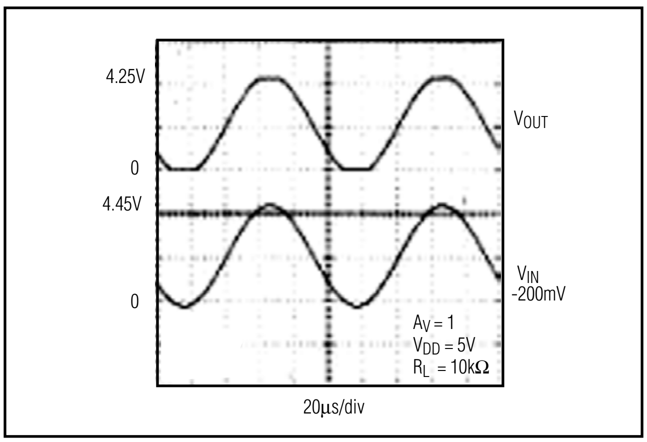

Figure 4. Rail-to-Rail Output Operation

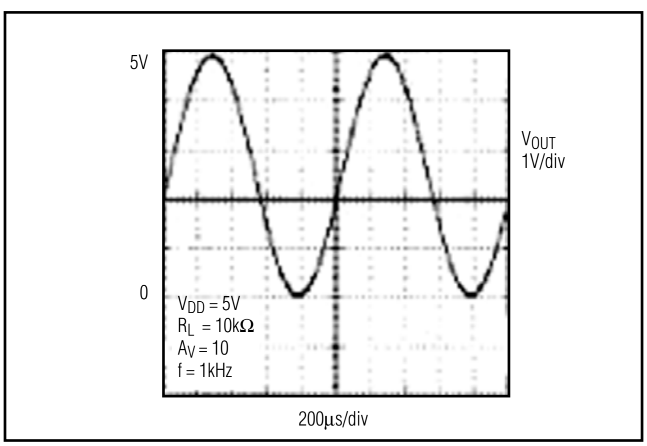

Figure 5. Capacitive-Load Driving Circuit

Using a Feed-Forward Compensation Capacitor, C_Z

The amplifier's input capacitance is 11pF. If the resistance seen by the inverting input is large (feedback network), this can introduce a pole within the amplifier's bandwidth, resulting in reduced phase margin. Compensate the reduced phase margin by introducing a feed-forward capacitor (C_Z) between the inverting input and the output (Figure 1). This effectively cancels the pole from the inverting input of the amplifier. Choose the value of C_Z as follows:

$$C_Z = 11 \times (R_F / R_G) \text{ [pF]}$$

In the unity-gain stable MAX4250–MAX4254, the use of a proper C_Z is most important for A_V = 2V/V, and A_V = -1V/V. In the decompensated MAX4249/MAX4255/MAX4256/MAX4257, C_Z is most important for A_V = 10V/V. Figures 2a and 2b show transient response both with and without C_Z.

Using a slightly smaller C_Z than suggested by the formula above achieves a higher bandwidth at the expense of reduced phase and gain margin. As a general guideline, consider using C_Z for cases where $R_G \parallel R_F$ is greater than 20kΩ (MAX4250–MAX4254) or greater than 5kΩ (MAX4249/MAX4255/MAX4256/MAX4257).

Applications Information

The MAX4249–MAX4257 combine good driving capability with ground-sensing input and rail-to-rail output operation. With their low distortion, low noise, and low-power consumption, these devices are ideal for use in portable instrumentation systems and other low-power, noise-sensitive applications.

Ground-Sensing and Rail-to-Rail Outputs

The common-mode input range of these devices extends below ground, and offers excellent common-mode rejection. These devices are guaranteed not to undergo phase reversal when the input is overdriven (Figure 3).

Figure 4 showcases the true rail-to-rail output operation of the amplifier, configured with A_V = 10V/V. The output swings to within 8mV of the supplies with a 10kΩ load, making the devices ideal in low-supply-voltage applications.

Output Loading and Stability

Even with their low quiescent current of 400µA, these amplifiers can drive 1kΩ loads while maintaining excellent DC accuracy. Stability while driving heavy capacitive loads is another key feature.

UCSP, Single-Supply, Low-Noise, Low-Distortion, Rail-to-Rail Op Amps

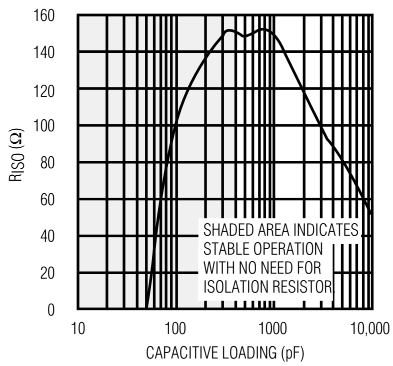

Figure 6. Isolation Resistance vs. Capacitive Loading to Minimize Peaking (<2dB)

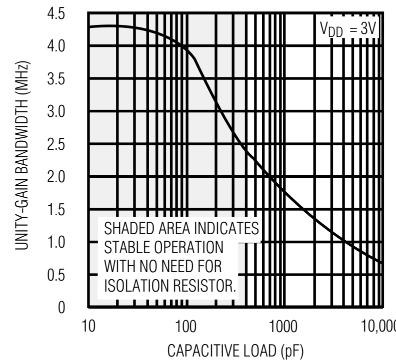

Figure 8. MAX4250–MAX4254 Unity-Gain Bandwidth vs. Capacitive Load

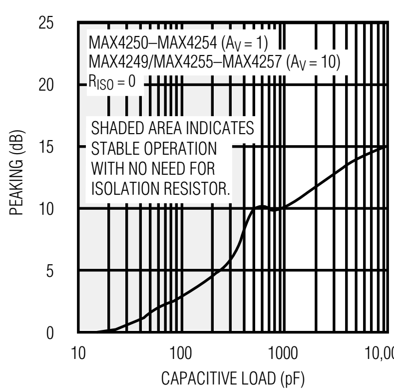

Figure 7. Peaking vs. Capacitive Load

These devices maintain stability while driving loads up to 400pF. To drive higher capacitive loads, place a small isolation resistor in series between the output of the amplifier and the capacitive load (Figure 5). This resistor improves the amplifier's phase margin by isolating the capacitor from the op amp's output. Reference Figure 6 to select a resistance value that will ensure a load capacitance that limits peaking to <2dB (25%). For example, if the capacitive load is 1000pF, the corresponding isolation resistor is 150Ω. Figure 7 shows that peaking occurs without the isolation resistor. Figure 8 shows the unity-gain bandwidth vs. capacitive load for the MAX4250–MAX4254.

Power Supplies and Layout

The MAX4249–MAX4257 operate from a single 2.4V to 5.5V power supply or from dual supplies of ±1.20V to ±2.75V. For single-supply operation, bypass the power supply with a 0.1µF ceramic capacitor placed close to the V_{DD} pin. If operating from dual supplies, bypass each supply to ground.

Good layout improves performance by decreasing the amount of stray capacitance and noise at the op amp's inputs and output. To decrease stray capacitance, minimize PC board trace lengths and resistor leads, and place external components close to the op amp's pins.

Typical Operating Circuit

Package Information

For the latest package outline information and land patterns (footprints), go to **www.maximintegrated.com/packages**. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

PACKAGE TYPE	PACKAGE CODE	OUTLINE NO.	LAND PATTERN NO.
5 SOT-23	U5+2	**21-0057**	**90-0174**
8 µMAX	U8+1	**21-0036**	**90-0092**
10 µMAX	U10+2	**21-0061**	**90-0330**
3 x 3 µCSP	B9+5	**21-0093**	—
14 SOIC	S14+1	**21-0041**	**90-0112**
12 µCSP	B12+4	**21-0104**	—

UCSP, Single-Supply, Low-Noise, Low-Distortion, Rail-to-Rail Op Amps

Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
8	10/11	Added lead-free packaging to the *Ordering Information* and changed the Input Bias Current and Input Offset Current conditions in the *Electrical Characteristics* table	1, 2, 14
9	12/12	Added MAX4257ESA/V+T to *Ordering Information*.	14

Maxim Integrated 160 Rio Robles, San Jose, CA 95134 USA 1-408-601-1000
