

DRV8317 Three-Phase PWM Motor Driver

1 Features

- Three-phase BLDC motor driver
 - Configurable slew rate for EMI mitigation
 - Programmable gain current sensing
 - Supports up to 200-kHz PWM frequency
 - Integrated shoot through protection
- 4.5-V to 20-V operating voltage
 - 24-V absolute maximum voltage
- High output current capability
 - 5-A peak current drive
- Low on-state resistance MOSFETs
 - $R_{DS(ON)}$ (HS + LS) at $T_A = 25^\circ\text{C}$: 130-m Ω (typical)
- Ultra-low Q-current sleep mode
 - 3- μA (max.) at $V_{VM} = 12\text{-V}$, $T_A = 25^\circ\text{C}$
- Multiple control interface options
 - 6x PWM control interface
 - 3x PWM control interface
- Integrated current sensing
 - No external current sense resistor required
 - Three-phase current sense outputs
- SPI and hardware device variants
 - 10-MHz SPI interface variant for flexibility
 - Pin configurable variant for simplicity
- Supports 1.8-V, 3.3-V, and 5-V logic inputs
- Built-in 3.3-V \pm 4.5%, 80-mA LDO regulator
- Integrated protection features
 - VM under voltage lockout (UVLO)
 - VM over voltage protection (OVP)
 - Charge pump under voltage (CPUV)
 - Over current protection (OCP)
 - Over temperature warning and shutdown (OTW/OTS)
 - Fault condition indication pin (nFAULT)

2 Applications

- [Brushless-DC \(BLDC\) Motor Modules](#)
- [Air Purifiers](#)
- [Dishwasher Pumps](#)
- [Vacuum Robots](#)
- [Washer and Dryer Pumps](#)
- [Drones and Hand-held Gimbals](#)
- [Laptop, Desktop, and Server Fans](#)
- [Coffee Machines](#)

3 Description

DRV8317 provides three integrated MOSFET half-bridges for driving three-phase brushless DC (BLDC) motors with 5-V, 9-V, 12-V, or 18-V DC rails or 2s to 4s batteries. The device provides integrated three-phase current sensing which eliminates the need for external sense resistors. DRV8317 has an integrated LDO that provides a regulated 3.3-V rail capable of delivering up to 80mA for external loads like MCU, logic circuits, hall sensors etc.,

DRV8317 provides a configurable 6x or 3x PWM control scheme which can be used to implement sensed or sensorless field-oriented control (FOC), sinusoidal control, or trapezoidal control using an external microcontroller. DRV8317 is capable of driving a PWM frequency of up to 200 kHz. DRV8317 is highly configurable either through SPI (DRV8317S) or pins (DRV8317H) - PWM mode, slew rate, current sense gain are some of the configurable features.

A number of protection features including supply under voltage lockout (UVLO), over voltage protection (OVP), charge pump under voltage (CPUV), over current protection (OCP), over temperature warning (OTW) and over temperature shutdown (OTS) are integrated into DRV8317 to protect the device, motor, and system against fault events. Fault conditions are indicated by the nFAULT pin.

Device Variant Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV8317S ⁽²⁾	WQFN (36)	5.00 mm \times 4.00 mm
DRV8317H	WQFN (36)	5.00 mm \times 4.00 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.
- (2) Device available for preview only.

DATE	REVISION	NOTES
April 2022	*	Initial release

5 Device Comparison Table

DEVICE	PACKAGES	INTERFACE
DRV8317S	36-pin WQFN (5-mm x 4-mm)	SPI
DRV8317H		Hardware (Pin)

Table 5-1. DRV8317S vs DRV8317H Configuration Comparison

Parameters	DRV8317S	DRV8317H
PWM control mode	PWM_MODE (4 settings)	MODE pin (2 settings)
Slew rate	SLEW_RATE (4 settings)	SLEW pin (4 settings)
Current sense amplifier gain	CSA_GAIN (4 settings)	GAIN pin (4 settings)
OCP blanking time	OCP_TBLANK (4 settings)	Fixed to 0.7- μ s
OCP deglitch time	OCP_DEG (4 settings)	Fixed to 0.6- μ s
OCP mode	OCP_MODE (4 settings), Configurable retry time	5-ms automatic retry
Dead time	Fixed based on SLEW_RATE setting	Fixed based on SLEW pin setting
Propagation delay	Fixed based on SLEW_RATE setting	Fixed based on SLEW pin setting
Driver delay compensation	DLYCMP_EN (2 settings)	Disabled
Spread Spectrum Clock for internal oscillator	SSC_DIS (2 settings)	Enabled
VM under voltage lockout	VM under voltage protection always enabled. VM under voltage protection mode set by UVP_MODE (2 settings); configurable retry time using SLOW_TRETRY and FAST_TRETRY.	VM under voltage protection always enabled. Auto-retry mode for VM under voltage with 5-ms retry time.
VIN_AVDD, AVDD under voltage lockout	VIN_AVDD and AVDD under voltage protection always enabled. Device resets on VIN_AVDD or AVDD under voltage.	VIN_AVDD and AVDD under voltage protection always enabled. Device resets on VIN_AVDD or AVDD under voltage.
CP under voltage lockout	CP under voltage protection always enabled. CP under voltage protection mode set by UVP_MODE (2 settings); configurable retry time using SLOW_TRETRY and FAST_TRETRY.	CP under voltage protection always enabled. Auto-retry mode for CP under voltage with 5-ms retry time.
VM over voltage	OVP_MODE (2 settings); configurable retry time using SLOW_TRETRY and FAST_TRETRY	5-ms automatic retry
SPI fault	SPIFLT_MODE (2 settings)	N/A
FET over temperature warning (OTW_FET)	Enable/disable using OTW_FET_EN. If enabled, over temperature warning is reported on nFAULT pin and OTW_FET bit in OT_STS register.	Disabled
FET over temperature shutdown (OTS_FET)	OTF_MODE (2 settings); configurable retry time using SLOW_TRETRY and FAST_TRETRY	5-ms automatic retry

6 Pin Configuration and Functions

Figure 6-1. DRV8317S 36-Pin WQFN With Exposed Thermal Pad Top View

Figure 6-2. DRV8317H 36-Pin WQFN With Exposed Thermal Pad Top View

Table 6-1. Pin Functions

PIN NAME	36-pin package		TYPE ⁽¹⁾	DESCRIPTION
	DRV8317S	DRV8317H		
AGND	21	21	GND	Device analog ground. Connect to a separate ground plane. ⁽¹⁾
AVDD	22	22	PWR O	3.3V regulator output. Connect a X5R or X7R, 2.2- μ F (no load) or 4.7- μ F (up to 80mA load), 6.3-V ceramic capacitor between the AVDD and AGND pins. This regulator can source up to 80 mA for external loads.
CP	6	6	PWR	Charge pump output. Connect a X5R or X7R, 1- μ F, 16-V ceramic capacitor between the CP and VM pins.
CPH	5	5	PWR	Charge pump switching node. Connect a X5R or X7R, 100-nF, (2xVM)- rated ceramic capacitor between the CPH and CPL pins.
CPL	4	4	PWR	

Table 6-1. Pin Functions (continued)

PIN NAME	36-pin package		TYPE ⁽¹⁾	DESCRIPTION
	DRV8317S	DRV8317H		
CSAREF	33	33	PWR I	Current sense amplifier power supply input/reference. Connect a X5R or X7R, 0.1- μ F, 6.3-V ceramic capacitor between the CSAREF and AGND pins.
GAIN	—	29	I	Available only in hardware variant (DRV8317H). The pin is a 4-level input pin for current sense amplifier gain setting.
INHA	23	23	I	High-side driver control input for OUTA. This pin controls the state of the high-side MOSFET in 6x/3x PWM Mode.
INHB	25	25	I	High-side driver control input for OUTB. This pin controls the state of the high-side MOSFET in 6x/3x PWM Mode.
INHC	27	27	I	High-side driver control input for OUTC. This pin controls the state of the high-side MOSFET in 6x/3x PWM Mode.
INLA	24	24	I	Low-side driver control input for OUTA. This pin controls the state of the low-side MOSFET in 6x PWM Mode.
INLB	26	26	I	Low-side driver control input for OUTB. This pin controls the state of the low-side MOSFET in 6x PWM Mode.
INLC	28	28	I	Low-side driver control input for OUTC. This pin controls the state of the low-side MOSFET in 6x PWM Mode.
MODE	—	31	I	Available only in hardware variant (DRV8317H). This is a 4-level input pin for PWM mode setting.
NC	3	3, 32	—	No connect. Leave the pin floating.
nFAULT	2	2	O	Fault indication pin. Pulled low during fault condition. Open-drain output; requires an external pull-up resistor to AVDD.
nSCS	32	—	I	Available only in SPI variant (DRV8317S). Serial chip select. A logic low on this pin enables serial interface communication.
nSLEEP	1	1	I	When this pin is logic low the device goes to a low-power sleep mode. A 15 to 50- μ s low pulse on nSLEEP pin can be used to reset fault conditions without entering sleep mode.
OUTA	11, 12	11, 12	O	Half-bridge output A. Connect to motor winding.
OUTB	14, 15	14, 15	O	Half-bridge output B. Connect to motor winding.
OUTC	17, 18	17, 18	O	Half-bridge output C. Connect to motor winding.
PGND	10, 13, 16, 19	10, 13, 16, 19	PWR	Device power ground. Connect to a separate ground plane. ⁽¹⁾
SCLK	31	—	I	Available only in SPI variant (DRV8317S). Serial clock input. Serial data is shifted out on the rising edge and captured on the falling edge of SCLK.
SDI	30	—	I	Available only in SPI variant (DRV8317S). Serial data input. Data (input) is captured on the falling edge of the SCLK pin (SPI devices).
SDO	29	—	O	Available only in SPI variant (DRV8317S). Serial data output. Data (output) is shifted out on the rising edge of the SCLK pin.
SLEW	—	30	I	Available only in hardware variant (DRV8317H). This pin is a 4-level input pin for OUTx voltage slew rate setting.
SOA	36	36	O	Current sense amplifier output for OUTA.
SOB	35	35	O	Current sense amplifier output for OUTB.
SOC	34	34	O	Current sense amplifier output for OUTC.
VIN_AVDD	7	7	PWR	Input supply for AVDD LDO
VM	8, 9, 20	8, 9, 20	PWR	Device and motor power supply. Connect to motor supply voltage; bypass to PGND with a 0.1- μ F capacitor plus one bulk capacitor. TI recommends a capacitor voltage rating at least twice the normal operating voltage of the device
Thermal pad			PWR	Must be connected to AGND.

(1) I = input, O = output, PWR = power, GND = ground, NC = no connect

7 Specifications

7.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Power supply pin voltage (VM, VIN_AVDD)	-0.3	24	V
Power supply voltage ramp during power up (VM)		2	V/μs
Voltage difference between ground pins (PGND, AGND)	-0.3	0.3	V
Charge pump voltage (CP)	-0.3	V _M + 6	V
Analog regulator pin voltage (AVDD)	-0.3	4	V
Logic pin input voltage (INHx, INLx, nSCS, nSLEEP, SCLK, SDI, GAIN, MODE, SLEW)	-0.3	6	V
Logic pin output voltage (SDO)	-0.3	6	V
Open drain pin output voltage (nFAULT)	-0.3	6	V
Open drain output current range (nFAULT)	0	5	mA
Current sense amplifier reference supply input (CSAREF)	-0.3	4	V
Current sense amplifier output (SOx)	-0.3	4	V
Output pin voltage (OUTA, OUTB, OUTC)	-1	V _M + 1 ⁽²⁾	V
Ambient temperature, T _A	-40	125	°C
Junction temperature, T _J	-40	150	°C
Storage temperature, T _{stg}	-65	150	°C

- Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime
- Maximum voltage supported on OUTx pin is 24V

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2500	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±750	

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V _{VM}	Power supply voltage	V _{VM} , V _{VIN_AVDD}	4.5	12	20	V
I _{OUT} ⁽¹⁾	Peak output winding current	V _{VM} ≥ 6 V, OUTA, OUTB, OUTC			5	A
		4.5 V ≤ V _{VM} < 6 V, OUTA, OUTB, OUTC			3	A
V _{OD}	Open drain pullup voltage	nFAULT	-0.3		5.5	V
I _{OD}	Open drain output current capability	nFAULT			5	mA
T _A	Operating ambient temperature		-40		125	°C
T _J	Operating Junction temperature		-40		150	°C

- Power dissipation and thermal limits must be observed

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DRV8317	UNIT
		REE (WQFN)	
		36	
R _{θJA}	Junction-to-ambient thermal resistance (JEDEC 4-layer PCB, 6 thermal vias)	36.4	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	23.7	°C/W
R _{θJB}	Junction-to-board thermal resistance	14	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.6	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	14	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	4.1	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

T_J = -40°C to +150°C, V_{VM} = 4.5 to 20 V (unless otherwise noted). Typical limits apply for T_A = 25°C, V_{VM} = 12 V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLIES						
I _{VMQ}	VM sleep mode current	V _{VM} = 12 V, nSLEEP = 0, T _A = 25 °C		1.7	3	μA
		nSLEEP = 0, T _A = 125 °C			10	μA
I _{VMS}	VM standby mode current	V _{VM} = 12 V, nSLEEP = 1, INHx = INLx = 0, SPI = 'OFF', T _A = 25 °C		8	10	mA
		nSLEEP = 1, INHx = INLx = 0, SPI = 'OFF'		8	10	mA
I _{VM}	VM operating mode current	V _{VM} = 12 V, nSLEEP = 1, f _{PWM} = 25 kHz, T _A = 25 °C		10	12	mA
		V _{VM} = 12 V, nSLEEP = 1, f _{PWM} = 200 kHz, T _A = 25 °C		10	14	mA
		nSLEEP = 1, f _{PWM} = 25 kHz		10	12	mA
		nSLEEP = 1, f _{PWM} = 200 kHz		10	15	mA
V _{AVDD}	Analog regulator voltage	V _{VM} ≥ 6V, V _{VIN_AVDD} ≥ 6V, 0 mA ≤ I _{AVDD} ≤ 80 mA	3.15	3.3	3.45	V
V _{AVDD}	Analog regulator voltage	4.5V ≤ V _{VM} < 6V, 4.5V ≤ V _{VIN_AVDD} < 6V, 0 mA ≤ I _{AVDD} ≤ 80 mA	3.15	3.3	3.45	V
I _{AVDD}	Analog regulator external load	4.5V ≤ V _{VM} < 6V, 4.5V ≤ V _{VIN_AVDD} < 6V			80	mA
I _{AVDD}	Analog regulator external load	V _{VM} ≥ 6V, V _{VIN_AVDD} ≥ 6V			80	mA
I _{AVDD_LIM}	Analog regulator current limit	V _{AVDD} ≥ 2.7V, soft short to GND	100	125	150	mA
C _{AVDD}	Capacitance for AVDD	External load I _{AVDD} = 0 mA	0.5	2.2	7.05	μF
		External load 0mA ≤ I _{AVDD} ≤ 80 mA	2.35	4.7	7.05	μF
V _{CP}	Charge pump regulator voltage	4.5V ≤ V _{VM} < 6V, CP with respect to VM	3	5	5.5	V
V _{CP}	Charge pump regulator voltage	V _{VM} ≥ 6V, CP with respect to VM	4.5	5	5.5	V
t _{WAKE}	Wakeup time	V _{VM} > V _{UVLO} , nSLEEP = 1 to output ready		1	3	ms
t _{WAKE_CSA}	Wakeup time for CSA	V _{CSAREF} > V _{CSAREF_UV} to SOx ready, when nSLEEP = 1		30		μs
t _{SLEEP}	Turn-off time	nSLEEP = 0 to driver tri-stated		100	200	μs
t _{RST}	Reset Pulse time	nSLEEP = 0 period to reset faults	15		50	μs
FOUR-LEVEL INPUTS (GAIN, MODE, SLEW)						
V _{L1}	Input mode 1 voltage	Tied to AGND	0	0.2*AVD D		V

$T_J = -40^{\circ}\text{C}$ to $+150^{\circ}\text{C}$, $V_{VM} = 4.5$ to 20 V (unless otherwise noted). Typical limits apply for $T_A = 25^{\circ}\text{C}$, $V_{VM} = 12\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{L2}	Input mode 2 voltage	47 k Ω \pm 5% tied to AGND	0.27*AV DD	0.4*AVD D	0.545*AV DD	V
V_{L3}	Input mode 3 voltage	Hi-Z	0.606*AV DD	0.757*AV DD	0.909*AV DD	V
V_{L4}	Input mode 4 voltage	Tied to AVDD	0.94*AV DD		AVDD	V
R_{PU}	Input pullup resistance	To AVDD		48		k Ω
R_{PD}	Input pulldown resistance	To AGND		160		k Ω
DRIVER OUTPUTS						
$R_{DS(ON)}$	Total MOSFET on resistance (High-side + Low-side)	$V_{VM} \geq 6\text{ V}$, $I_{OUT} = 1\text{ A}$, $T_J = 25^{\circ}\text{C}$, includes bond wire and metallization resistance		130	157	m Ω
		$V_{VM} \geq 6\text{ V}$, $I_{OUT} = 1\text{ A}$, $T_J = 125^{\circ}\text{C}$, across process, includes bond wire and metallization resistance		180	221.5	m Ω
$R_{DS(ON)}$	Total MOSFET on resistance (High-side + Low-side)	$4.5\text{ V} \leq V_{VM} < 6\text{ V}$, $I_{OUT} = 1\text{ A}$, $T_J = 25^{\circ}\text{C}$, includes bond wire and metallization resistance		155	210	m Ω
		$4.5\text{ V} \leq V_{VM} < 6\text{ V}$, $I_{OUT} = 1\text{ A}$, $T_J = 125^{\circ}\text{C}$, across process, includes bond wire and metallization resistance		225	290	m Ω
SR_{RISE}	Phase pin slew rate switching low to high (Rising from 20 % to 80 % of VM)	$V_{VM} = 12\text{ V}$, SLEW_RATE = 00b (SPI Variant) or SLEW pin tied to AGND (HW Variant)	13.75	25	36.25	V/ μs
		$V_{VM} = 12\text{ V}$, SLEW_RATE = 01b (SPI Variant) or SLEW pin to 47 k Ω +/- 5% tied to AGND (HW Variant)	27.5	50	72.5	V/ μs
		$V_{VM} = 12\text{ V}$, SLEW_RATE = 10b (SPI Variant) or SLEW pin to Hi-Z (HW Variant)	62.5	125	187.5	V/ μs
		$V_{VM} = 12\text{ V}$, SLEW_RATE = 11b (SPI Variant) or SLEW pin tied to AVDD (HW Variant)	80	200	320	V/ μs
SR_{FALL}	Phase pin slew rate switching high to low (Falling from 80 % to 20 % of VM)	$V_{VM} = 12\text{ V}$, SLEW_RATE = 00b (SPI Variant) or SLEW pin tied to AGND (HW Variant)	13.75	25	48	V/ μs
		$V_{VM} = 12\text{ V}$, SLEW_RATE = 01b (SPI Variant) or SLEW pin to 47 k Ω +/- 5% tied to AGND (HW Variant)	27.5	50	72.5	V/ μs
		$V_{VM} = 12\text{ V}$, SLEW_RATE = 10b (SPI Variant) or SLEW pin to Hi-Z (HW Variant)	62.5	125	187.5	V/ μs
		$V_{VM} = 12\text{ V}$, SLEW_RATE = 11b (SPI Variant) or SLEW pin tied to AVDD (HW Variant)	80	200	320	V/ μs
I_{LEAK}	Leakage current OUTx	$V_{VM} = V_{OUTx} = 20\text{ V}$, Standby State		0.7	2	mA
I_{LEAK}	Leakage current OUTx	$V_{OUTx} = 0\text{ V}$, Standby State	-50	-10		μA

$T_J = -40^\circ\text{C}$ to $+150^\circ\text{C}$, $V_{VM} = 4.5$ to 20 V (unless otherwise noted). Typical limits apply for $T_A = 25^\circ\text{C}$, $V_{VM} = 12\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{DEAD}	Dead time (high to low / low to high)	$V_{VM} = 12\text{V}$, SLEW_RATE = 00b (SPI Variant) or SLEW pin tied to AGND (HW Variant)		575	1500	ns
		$V_{VM} = 12\text{V}$, SLEW_RATE = 01b (SPI Variant) or SLEW pin to $47\text{ k}\Omega \pm 5\%$ tied to AGND (HW Variant)		325	750	ns
		$V_{VM} = 12\text{V}$, SLEW_RATE = 10b (SPI Variant) or SLEW pin to Hi-Z (HW Variant)		250	600	ns
		$V_{VM} = 12\text{V}$, SLEW_RATE = 11b (SPI Variant) or SLEW pin tied to AVDD (HW Variant)		250	600	ns
t_{PD}	Propagation delay (high-side / low-side ON/OFF)	INHx = 1 to OUTx transision, $V_{VM} = 12\text{V}$, SLEW = 00b (SPI Variant) or SLEW pin tied to AGND (HW Variant)		1300	1750	ns
		INHx = 1 to OUTx transision, $V_{VM} = 12\text{V}$, SLEW = 01b (SPI Variant) or SLEW pin to $47\text{ k}\Omega \pm 5\%$ tied to AGND (HW Variant)		800	1050	ns
		INHx = 1 to OUTx transision, $V_{VM} = 12\text{V}$, SLEW = 10b (SPI Variant) or SLEW pin to Hi-Z (HW Variant)		450	600	ns
		INHx = 1 to OUTx transision, $V_{VM} = 12\text{V}$, SLEW = 11b (SPI Variant) or SLEW pin tied to AVDD (HW Variant)		425	500	ns
t_{MIN_PULSE}	Minimum output pulse width	SLEW = 11b (SPI Variant) or SLEW pin tied to AVDD (HW Variant)	500			ns
CURRENT SENSE AMPLIFIER						
G_{CSA}	Current sense gain	CSA_GAIN = 00b (SPI Variant) or GAIN pin tied to AGND (HW Variant)		0.25		V/A
		CSA_GAIN = 01b (SPI Variant) or GAIN pin to $47\text{ k}\Omega \pm 5\%$ tied to AGND (HW Variant)		0.5		V/A
		CSA_GAIN = 10b (SPI Variant) or GAIN pin to Hi-Z (HW Variant)		1		V/A
		CSA_GAIN = 11b (SPI Variant) or GAIN pin tied to AVDD (HW Variant)		2		V/A
G_{CSA_ERR}	Current sense gain error	$T_A = 25^\circ\text{C}$, $I_{PHASE} \leq 2.5\text{ A}$	-3		3	%
G_{CSA_ERR}	Current sense gain error	$T_A = 25^\circ\text{C}$, $2.5\text{ A} < I_{PHASE} \leq 4\text{ A}$	-3.5		3.5	%
G_{CSA_ERR}	Current sense gain error	$T_A = 25^\circ\text{C}$, $4\text{ A} < I_{PHASE} \leq 5\text{ A}$	-3.5		4.5	%
G_{CSA_ERR}	Current sense gain error	$I_{PHASE} \leq 2.5\text{ A}$	-4.5		4.5	%
G_{CSA_ERR}	Current sense gain error	$2.5\text{ A} < I_{PHASE} \leq 4\text{ A}$	-5		6	%
G_{CSA_ERR}	Current sense gain error	$4\text{ A} < I_{PHASE} \leq 5\text{ A}$	-5		8	%
I_{MATCH}	Current sense gain error matching between phases A, B and C	$T_J = 25^\circ\text{C}$	-3		3	%
			-5		5	%
FSPOS	Full scale positive current measurement		5			A
FSNEG	Full scale negative current measurement				-5	A
V_{LINEAR}	SOX output voltage linear range		0.25		$V_{REF} - 0.25$	V

8 Detailed Description

8.1 Overview

The DRV8317 is an integrated MOSFET driver for 3-phase motor-drive applications. The combined high-side and low-side FETs' on-state resistance is 130-m Ω (typical). The device reduces system component count, cost, and complexity by integrating three MOSFET half-bridges, gate drivers, charge pump, current sense amplifiers and linear regulator for external loads. In DRV8317S, a standard serial peripheral interface (SPI) provides a simple method for configuring the various device settings and reading fault status information through an external controller. In DRV8317H, a hardware (pin-based) interface allows configuring the PWM mode (6x or 3x), current sense amplifier gain and output slew rate through pin voltage levels.

The gate driver architecture is designed to protect against short-circuit events and dV/dt parasitic turn-on of the internal power MOSFETs.

The DRV8317 integrates three bi-directional low-side current sense amplifiers for monitoring the current through each of the half-bridges using a built-in current sense circuit; no external current sense resistors are needed. The gain of the current sense amplifiers can be adjusted through the SPI or hardware interface.

In addition to the high level of device integration, the DRV8317 provides a wide range of integrated protection features. These features include power supply undervoltage lockout (UVLO), over voltage protection (OVP), charge pump undervoltage lockout (CPUV), over current protection (OCP), AVDD under voltage lockout (AVDD_UV) and over temperature warning and shutdown (OTW and OTS). Fault events are indicated by the nFAULT pin with detailed information available in the status registers in the SPI variant.

The DRV8317S, DRV8317H devices are available in 0.4-mm pin pitch, WQFN surface-mount packages. The WQFN package size is 5.00-mm \times 4.00-mm with a height of 0.8-mm.

8.3 Feature Description

Table 8-1 lists the recommended values of the external components for the driver.

Table 8-1. DRV8317 External Components

COMPONENTS	PIN 1	PIN 2	RECOMMENDED
C _{VM1}	VM	PGND	X5R or X7R, 0.1-μF, (2 x VM)-rated capacitor
C _{VM2}	VM	PGND	≥ 10-μF, (2 x VM)-rated electrolytic capacitor
C _{VIN_AVDD1}	VIN_AVDD	AGND	X5R or X7R, 0.1-μF, (2 x VIN_AVDD)-rated capacitor
C _{VIN_AVDD2}	VIN_AVDD	AGND	≥ 10-μF, (2 x VIN_AVDD)-rated capacitor
C _{FLY}	CPH	CPL	X5R or X7R, 0.1-μF, (2 x VM)-rated capacitor
C _{CP}	CP	VM	X5R or X7R, 16-V, 1-μF capacitor
C _{AVDD}	AVDD	AGND	X5R or X7R, 2.2-μF (no external load) 4.7-μF (up to 80mA load), 6.3-V capacitor
R _{nFAULT}	AVDD	nFAULT	5.1-kΩ, Pull-up resistor
R _{MODE}	MODE	AGND	Section 8.3.3.2
R _{SLEW}	SLEW	AGND	Section 8.3.3.2
R _{GAIN}	GAIN	AGND	Section 8.3.3.2
C _{CSAREF}	CSAREF	AGND	X5R or X7R, 0.1-μF, (2 x CSAREF)-rated capacitor

8.3.1 Output Stage

The DRV8317 consists of integrated N-channel FETs (high-side and low-side) connected in a three-phase bridge configuration. A doubler charge pump provides the proper gate-bias voltage to the high-side N-channel FETs across a wide operating (VM) voltage range in addition to providing 100% duty-cycle support. An internal linear regulator operating from the VM supply provides the gate-bias voltage (VLS) for the low-side N-channel FETs.

8.3.2 Control Modes

The DRV8317 family of devices provides three different control modes to support various commutation and control methods. Table 8-2 shows the various modes of the DRV8317 device.

Table 8-2. PWM Control Modes

PWM Control Mode	PWM_MODE register (DRV8317S)	MODE Pin (DRV8317H)
6x PWM	PWM_MODE = 00b	MODE pin tied to AGND directly or tied to AGND via 47-kΩ resistor
6x direct PWM	PWM_MODE = 01b	Not Available
3x PWM	PWM_MODE = 10b	MODE pin floating (Hi-Z) or tied to AVDD
3x direct PWM	PWM_MODE = 11b	Not Available

The difference between 6x PWM (or 3x PWM) and 6x direct PWM (or 3x direct PWM) is that in the direct (6x or 3x) PWM mode, the delay compensation logic circuit is bypassed and the inputs at INHx, INLx are directly passed on to the gate driver circuit. In the gate driver circuit, a dead time (t_{DRV_DEAD}) is added before driving the FETs to prevent shoot through faults - this dead time is available in all the four PWM control modes.

Note

TI does not recommend changing the MODE pin or PWM_MODE register during power up of the device (during t_{WAKE}). The MODE pin setting on DRV8317H is latched at power up, so set nSLEEP = 0 before changing the MODE pin configuration on the DRV8317H. In DRV8317S, set all INHx and INLx pins to logic low before changing the PWM_MODE register.

8.3.2.1 6x PWM Mode

In 6x PWM mode, each half-bridge supports three output states: low, high, or high-impedance (Hi-Z). To configure DRV8317H in 6x PWM mode, connect the MODE pin to AGND or connect the MODE pin to AGND via 47-kΩ resistor. To enable 6x PWM mode in DRV8317S, configure the MODE bits with PWM_MODE = 00b or 01b. The corresponding INHx and INLx signals control the output state as listed in [Table 8-3](#).

Table 8-3. 6x PWM Mode Truth Table

INHx	INLx	OUTx
0	0	Hi-Z
0	1	L
1	0	H
1	1	Hi-Z

Figure 8-3 shows the application diagram of DRV8317 configured in 6x PWM mode.

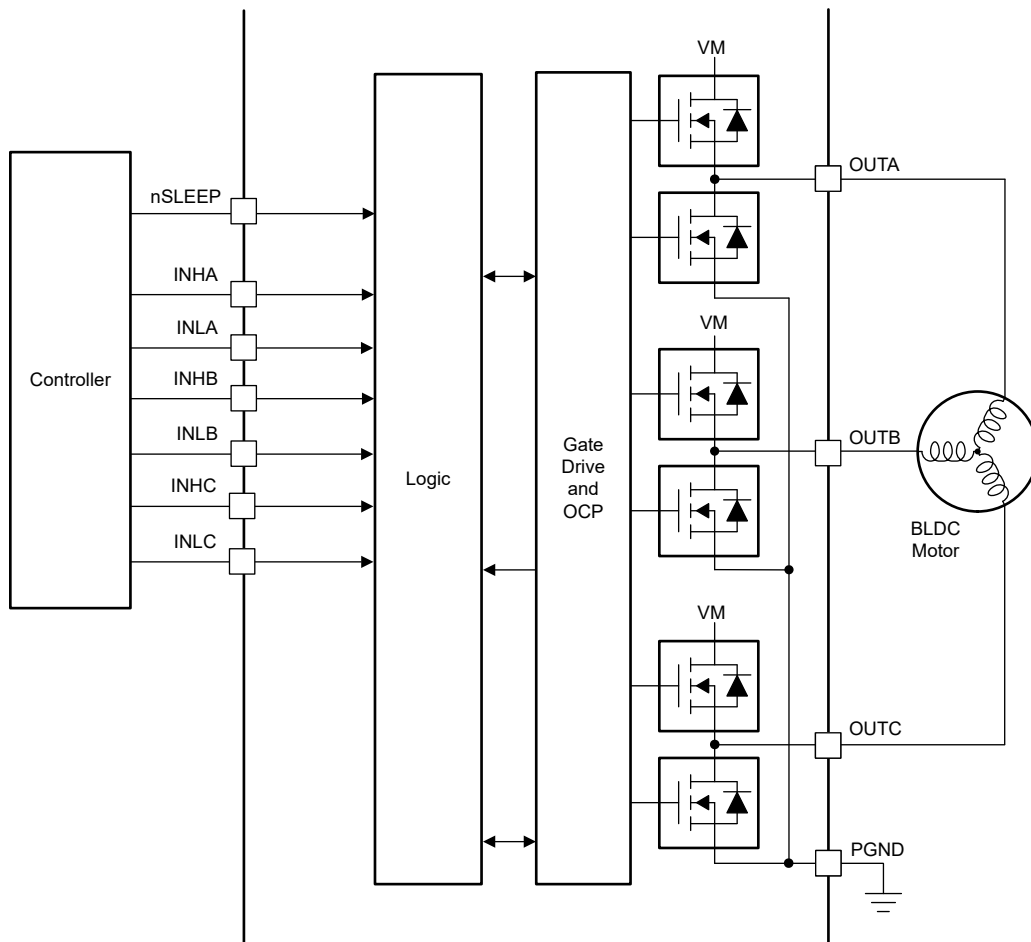

Figure 8-3. 6x PWM Mode

8.3.2.2 3x PWM Mode

In 3x PWM mode, the INHx pin controls each half-bridge and supports two output states: low or high. To configure DRV8317H in 3x PWM mode, connect the MODE pin to AVDD or keep the MODE pin floating (Hi-Z). To enable 3x PWM mode in DRV8317S, set PWM_MODE to 10b or 11b. The INLx pin is used to put the half bridge in the Hi-Z state. If the Hi-Z state is not required, tie all INLx pins to logic high (for example, by tying them to AVDD). The corresponding INHx and INLx signals control the output state as listed in [Table 8-4](#).

Table 8-4. 3x PWM Mode Truth Table

INLx	INHx	OUTx
0	X	Hi-Z
1	0	L
1	1	H

Figure 8-4 shows the typical application diagram of the DRV8317 configured in 3x PWM mode.

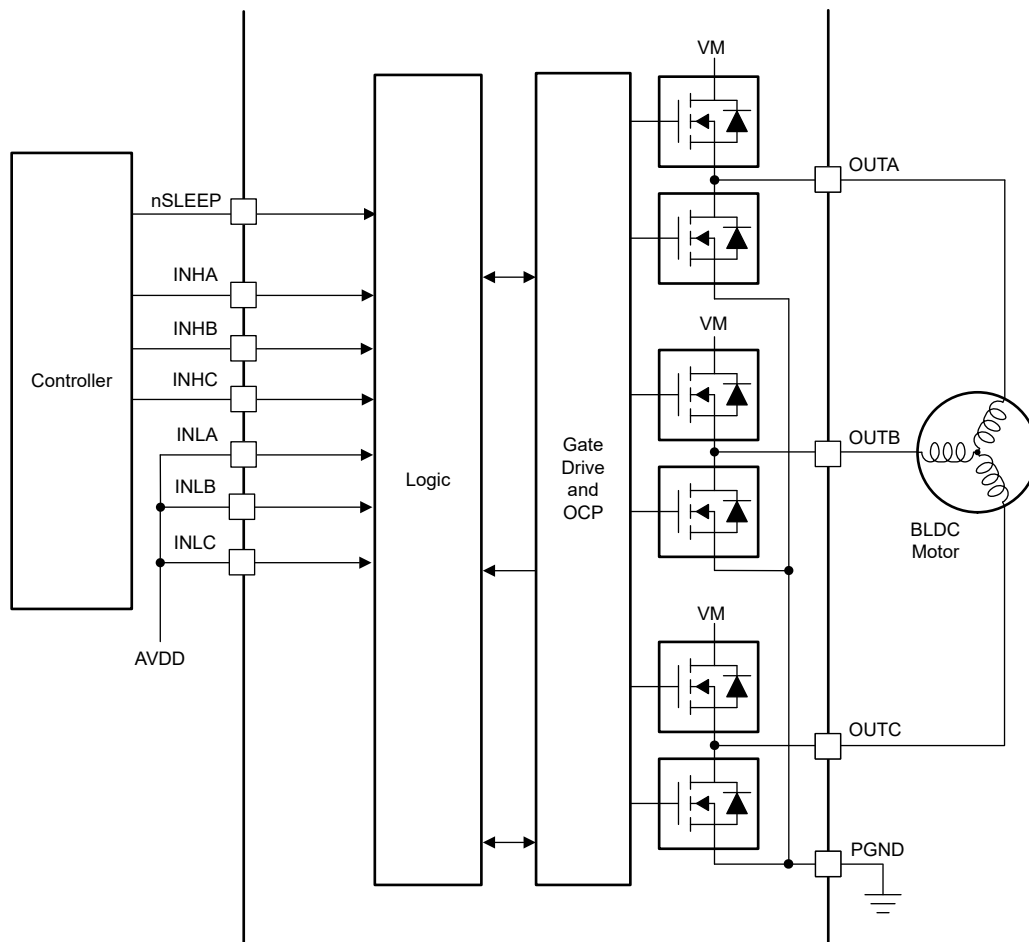

Figure 8-4. 3x PWM Mode

8.3.3 Device Interface Modes

The DRV8317 family of devices supports two different interface modes (SPI and hardware) to offer either increased simplicity (hardware interface) or greater flexibility (SPI interface). The SPI (DRV8317S) and hardware (DRV8317H) interface modes share the same four pins, allowing the different versions to be pin-to-pin compatible. Designers are encouraged to evaluate with the SPI interface version due to ease of changing settings, and may consider switching to the hardware interface with minimal modifications to the design.

8.3.3.1 Serial Peripheral Interface (SPI)

The SPI variant (DRV8317S) supports a serial communication bus that allows an external controller to send and receive data with DRV8317. This enables the external controller to configure device settings and read detailed fault information. The interface is a four wire interface using the SCLK, SDI, SDO, and nSCS pins which are described as follows:

- The SCLK (serial clock) pin is an input that accepts a clock signal to determine when data is captured and propagated on the SDI and SDO pins.
- The SDI (serial data in) pin is the data input.
- The SDO (serial data out) pin is the data output.
- The nSCS (serial chip select) pin is the chip select input. A logic low signal on this pin enables SPI communication with the DRV8317.

For more information on the SPI, see [Section 8.5](#).

8.3.3.2 Hardware Interface

The hardware variant (DRV8317H) replaces the four SPI pins with three resistor-configurable pins, namely, GAIN, SLEW and MODE (one of the four SPI pins is NC in hardware variant).

PWM control mode, CSA gain and driver output slew rate can be adjusted on the hardware interface by tying the respective pins to AGND, AVDD, pulling down to AGND with a 47-kΩ resistor or by leaving the pin floating (Hi-Z). In DRV8317H, fault conditions are reported on the nFAULT pin, but detailed fault information is not available.

- The GAIN pin configures the gain of the current sense amplifier.
- The SLEW pin configures the slew rate of the output voltage to motor.
- The MODE pin configures the PWM control mode.

For more information on the hardware interface, see [Section 8.3.9](#).

Table 8-5. Hardware Pins Decode

Configuration	GAIN	SLEW	MODE
Pin tied to AGND	0.25-V/A	25-V/μs	6x PWM mode
Pin pulled to AGND via 47-kΩ	0.5-V/A	50-V/μs	6x PWM mode
Pin floating (Hi-Z)	1-V/A	125-V/μs	3x PWM mode
Pin tied to AVDD	2-V/A	200-V/μs	3x PWM mode

Figure 8-5. DRV8317S SPI Interface

Figure 8-6. DRV8317H Hardware Interface

8.3.4 AVDD Linear Voltage Regulator

A 3.3-V, 80mA linear regulator is integrated in the DRV8317 and is available to power external circuits. The AVDD regulator is used for powering up the internal circuits of DRV8317 and can also provide power to external

circuits like MCU, logic, hall sensors, LEDs for up to 80 mA. The output of the AVDD regulator should be bypassed near the AVDD pin with a X5R or X7R, up to 7.05µF (4.7µF typical), 6.3-V ceramic capacitor routed directly back to the adjacent AGND ground pin.

The AVDD nominal, no-load output voltage is 3.3 V.

Figure 8-7. AVDD Linear Regulator Block Diagram

Use [Equation 1](#) to calculate the power dissipated in the device by the AVDD linear regulator.

$$P = (V_{VIN_AVDD} - V_{AVDD}) \times I_{AVDD} \quad (1)$$

The supply input voltage for AVDD regulator (VIN_AVDD) can be same as VM supply voltage, or lower or higher than VM supply voltage.

8.3.5 Charge Pump

The DRV8317 requires a gate-drive voltage higher than the VM power supply to enhance the high-side FETs fully because the output stages uses N-channel FETs for both high-side and low-side. The DRV8317 integrates a charge pump circuit that generates a voltage above the VM supply for this purpose.

The charge pump requires two external capacitors for operation. See [Table 8-1](#) for details on the capacitor value.

The charge pump shuts down when nSLEEP is low.

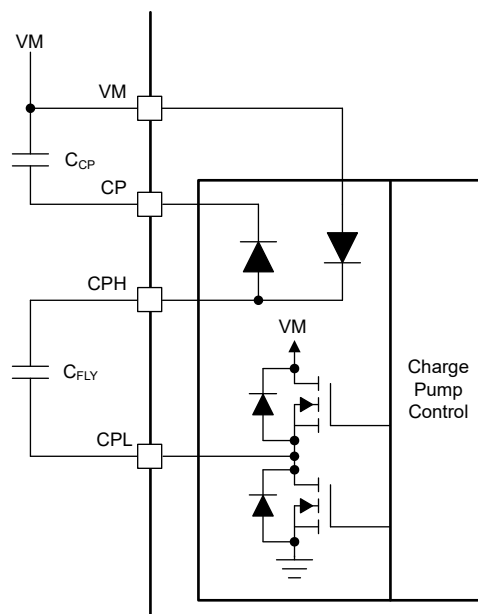

Figure 8-8. DRV8317 Charge Pump

8.3.6 Slew Rate Control

An adjustable gate-drive current to the MOSFETs allows for driver output slew rate control. The MOSFET VDS slew rate is a critical factor in optimizing radiated emissions, energy and duration of diode recovery spikes and switching voltage transients related to parasitics. This slew rate is predominantly determined by the rate of gate charge to the MOSFETs as shown in Figure 8-9.

Figure 8-9. Slew Rate Control

The slew rate of each half-bridge can be adjusted by SLEW pin in hardware variant or by SLEW_RATE register in SPI variant. The slew rate is calculated by the rise-time and fall-time of the voltage on OUTx pin as shown in Figure 8-10.

Figure 8-10. Slew Rate Measurement

8.3.7 Cross Conduction (Dead Time)

The device is fully protected against any cross conduction of MOSFETs - during the switching of high-side and low-side MOSFETs, DRV8317 avoids shoot-through events by inserting a dead time (t_{dead}). This is implemented by sensing the gate-source voltage (VGS) of the high-side and low-side MOSFETs and ensuring that VGS of high-side MOSFET has dropped below turn-off level before switching on the low-side MOSFET of same half-bridge (or vice-versa) as shown in Figure 8-11 and Figure 8-12. The VGS of the high-side and low-side MOSFETs (VGS_HS and VGS_LS) shown in Figure 8-12 are DRV8317 internal signals.

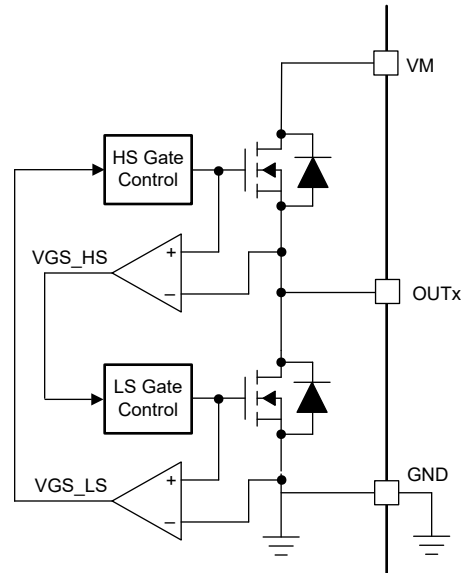

Figure 8-11. Cross Conduction Protection

Figure 8-12. Dead Time

8.3.8 Propagation Delay

The propagation delay time (t_{pd}) is measured as the time between an input logic edge to change in OUTx voltage. The propagation delay time includes the input deglitch delay, analog driver delay, and depends on the slew rate setting. The input deglitcher prevents high-frequency noise on the input pins from affecting the output state of the gate drivers. To support multiple control modes, a small digital delay is added as the input command propagates through the device.

Figure 8-13. Propagation Delay

8.3.9 Pin Diagrams

This section presents the I/O structure of all digital input and output pins.

8.3.9.1 Logic Level Input Pin (Internal Pulldown)

Figure 8-14 shows the input structure for the logic levels pins INHx, INLx, nSLEEP, SCLK and SDI. The input can be driven with an external resistor to GND or an external logic voltage supply. It is recommended to pull these pins low in device sleep mode to reduce leakage current through the internal pull-down resistors.

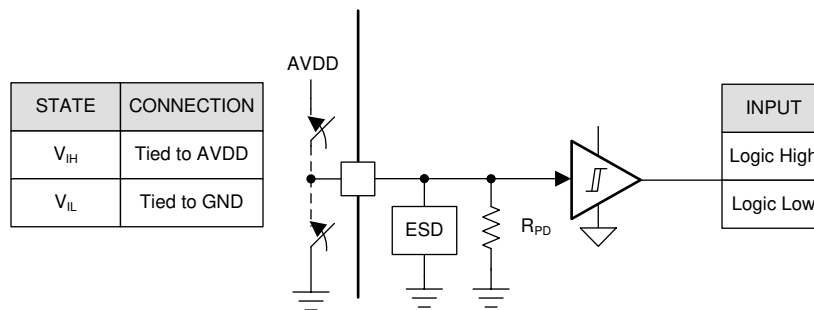

Figure 8-14. Logic-Level Input Pin Structure

8.3.9.2 Logic Level Input Pin (Internal Pullup)

Figure 8-15 shows the input structure for the logic level pin nSCS. The input can be driven with an external resistor to GND or an external logic voltage supply .

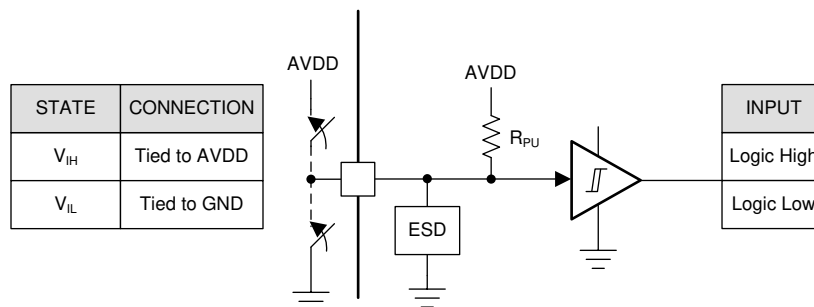

Figure 8-15. nSCS Input Pin Structure

8.3.9.3 Open Drain Pin

Figure 8-16 shows the structure of the open-drain output pin nFAULT. The open-drain output requires an external pullup resistor to a logic voltage supply to function properly.

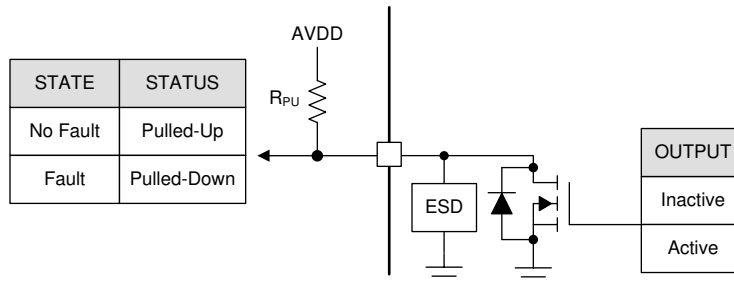

Figure 8-16. Open Drain Output Pin Structure

8.3.9.4 Push Pull Pin

Figure 8-17 shows the structure of the push-pull pin SDO.

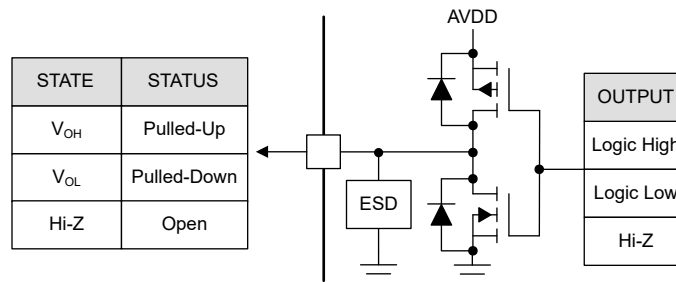

Figure 8-17. Push-Pull Output Pin Structure

8.3.9.5 Four Level Input Pin

Figure 8-18 shows the structure of the four level input pins GAIN, MODE and SLEW on hardware interface devices. The input can be set by tying the pin to AGND or AVDD, leaving the pin unconnected, or connecting an external resistor from the pin to ground.

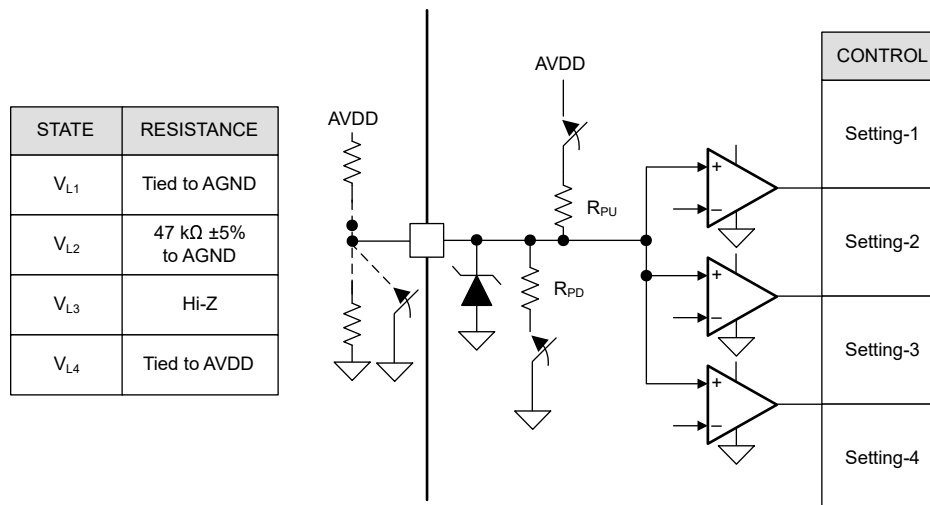

Figure 8-18. Four Level Input Pin Structure

8.3.10 Current Sense Amplifiers

The DRV8317 integrates three high-performance low-side current sense amplifiers for current measurements using built-in current sense. Low-side current measurements are commonly used to implement overcurrent protection, external torque control, or brushless DC commutation with the external controller. Each amplifier senses the current in the corresponding half-bridge when the low-side MOSFET is conducting. The current sense amplifiers include features such as configurable gain (through CSA_GAIN register or GAIN pin) and an external voltage reference (VREF) provided through CSAREF pin.

8.3.10.1 Current Sense Amplifier Operation

The SOx pin on the DRV8317 provides an analog voltage proportional to the current flowing in the low side MOSFETs (I_{OUTx}) multiplied by the gain setting (G_{CSA}) of the current sense amplifier. The gain setting is adjustable between four different levels which can be set by the GAIN pin (hardware variant) or the CSA_GAIN register (SPI variant).

Figure 8-19 shows the internal architecture of the current sense amplifiers. The current sense is implemented with a sense FET on each low-side FET of the DRV8317 device. This current information is converted in to a voltage based on the CSAREF pin (V_{REF}) input and the CSA gain setting; this voltage is available on the SOx pin. The CSA output voltage can be calculated using Equation 2

$$SOx = V_{REF}/2 + (G_{CSA} * I_{OUTx}), \text{ wherein } I_{OUTx} \text{ is considered positive in the direction shown in Figure 8-19.} \quad (2)$$

Figure 8-19. Integrated Current Sense Amplifier

Figure 8-20 shows the I_{OUTx} to CSA output transfer function. In bi-directional operation, the amplifier output for 0-A input is set at $V_{REF}/2$. Any change in the output phase current results in a corresponding change in the amplifier output as given in Equation 2.

Figure 8-20. IOUtx to CSA Transfer Function

The amplifier has a defined linear region as shown in Figure 8-21.

Figure 8-21. Bi-directional Current Sense Linear Region

Note

The current sense amplifiers use the external voltage reference (VREF) provided at the CSAREF pin.

8.3.11 Protections

The DRV8317 is protected against VM, VIN_AVDD, AVDD, CP under voltage, VM over voltage, SPI fault, OTP read fault, FET over current and FET, LDO over temperature events. Table 8-6 summarizes various fault details.

Table 8-6. Fault Action and Response

FAULT	CONDITION	CONFIGURATION	REPORT	PRE-DRIVER	FAULT STATUS BITS	DIGITAL	RECOVERY
VM under voltage lockout (VM_UV)	$V_{VM} < V_{UVLO}$ (falling)	UVP_MODE = 00b	nFAULT	Hi-Z	Latched	Active	Automatic: SLOW_TRETRY and $V_{VM} > V_{UVLO}$ (rising)
		UVP_MODE = 01b	nFAULT	Hi-Z	Latched	Active	Automatic: FAST_TRETRY and $V_{VM} > V_{UVLO}$ (rising)
VM under voltage warning (VMUV_WARN)	$V_{VM} < V_{VMUV_WARN_FALL}$	VMUV_WARN_MODE = 00b	nFAULT	Hi-Z	Latched	Active	Automatic: SLOW_TRETRY and $V_{VM} > V_{VMUV_WARN_RISE}$
		VMUV_WARN_MODE = 01b	nFAULT	Hi-Z	Latched	Active	Automatic: FAST_TRETRY and $V_{VM} > V_{VMUV_WARN_RISE}$
		VMUV_WARN_MODE = 10b	nFAULT	Active	Latched	Active	No action; report only mode
		VMUV_WARN_MODE = 11b	—	Active	—	Active	—
VIN_AVDD under voltage (VIN_AVDD_UV)	$V_{VIN_AVDD} < V_{VIN_AVDD_UV}$ (falling)	—	—	Hi-Z	—	Reset	Automatic: $V_{VIN_AVDD} > V_{VIN_AVDD_UV}$ (rising)

8.3.11.1 Under Voltage Protection (UVP)

DRV8317 has under voltage protection enabled for VM, VIN_AVDD, AVDD and CP voltage rails - these fault protections cannot be disabled. VM, VIN_AVDD and AVDD under voltage faults result in device reset; CP under voltage fault response is user configurable through UVP mode.

VM, VIN_AVDD, AVDD Under Voltage Protection (VIN_AVDD_UV, AVDD_UV)

If at any time, the voltage on VIN_AVDD or AVDD pin falls below the corresponding under voltage falling threshold ($V_{VINAVDD_UV}$ or V_{AVDD_UV}), DRV8317 enters reset - in reset, FETs are in Hi-Z, pre-driver, charge pump, current sense amplifier and digital logic are disabled. Normal device operation resumes automatically after the respective rail voltage rises above the corresponding under voltage rising threshold ($V_{VINAVDD_UV}$ or V_{AVDD_UV}) as shown in Figure 8-22.

Figure 8-22. VIN_AVDD, AVDD Under Voltage Protection

VM, CP Under Voltage Protection (VM_UV, CP_UV)

If at any time the voltage on VM or CP pin falls below the corresponding under voltage falling threshold (V_{VM_UV} or V_{CP_UV}), FETs are in Hi-Z, charge pump is disabled, nFAULT pin is driven low, FAULT and UVP in DEV_STS

and VM_UV or CP_UV in SUP_STS are set to 1b. Normal operation resumes automatically (pre-driver, charge pump operation and the nFAULT pin is released) once the retry time (t_{RETRY}) lapses after VM or CP voltage is above the corresponding under voltage rising threshold (V_{VM_UV} or V_{CP_UV}) as shown in Figure 8-23. The FAULT, UVP and UV_UV or CP_UV bits stay set to 1b until a clear fault command is issued either through the FLT_CLR bit or an nSLEEP reset pulse (t_{RST}).

Retry time (t_{RETRY}) is set by,

- Slow retry time (SLOW_TRETRY) by configuring UVP_MODE to 00b
- Fast retry time (FAST_TRETRY) by configuring UVP_MODE to 01b

IN DRV8317H, UVP_MODE is set to 01b and FAST_TRETRY is fixed at 5-ms.

Figure 8-23. VM, CP Under Voltage Protection

8.3.11.2 VM Under Voltage Warn (VMUV_WARN) Protection

DRV8317 provides user configurable thresholds ($V_{VMUV_WARN_FALL}$, $V_{VMUV_WARN_RISE}$) for VM under voltage warn protection. If at any time, voltage on VM pin falls below the $V_{VMUV_WARN_FALL}$ threshold, action is taken as per VMUV_WARN_MODE configuration. There are four settings for VMUV_WARN_MODE: automatic retry with slow and fast retry time, report only and disabled. The threshold for the VM under voltage warn fault condition to be removed is set by $V_{VMUV_WARN_RISE}$. This fault can be enabled/ disabled using VMUV_WARN_EN. In DRV8317H, this fault is enabled by default and set to report only mode (VMUV_WARN_MODE set to 10b).

8.3.11.2.1 VM Under Voltage Warn Automatic Retry (VMUV_WARN_MODE = 00b or 01b)

After a VM under voltage warn event in this mode, all the FETs are in Hi-Z and the nFAULT pin is driven low. The FAULT, UVW bits (in DEV_STS register) and VMUV_WARN bit (in SUP_STS register) are set to 1b. Normal operation resumes automatically (pre-driver operation and the nFAULT pin is released) once the retry time (t_{RETRY}) time lapses after the VM pin voltage rises above the $V_{VMUV_WARN_RISE}$ threshold as shown in Figure 8-24. The FAULT, UVW and VMUV_WARN bits stay set to 1b until clear fault command is issued either through the FLT_CLR bit or an nSLEEP reset pulse (t_{RST}).

Retry time (t_{RETRY}) is set by,

- Slow retry time (SLOW_TRETRY) by configuring VPWR_MODE to 00b
- Fast retry time (FAST_TRETRY) by configuring VPWR_MODE to 01b

Figure 8-24. VM Under Voltage Warning

8.3.11.2.2 VM Under Voltage Warn Report Only (VMUV_WARN_MODE = 10b)

No protective action occurs after a VM under voltage warn event in this mode. The VM under voltage warn event is reported by driving the nFAULT pin low and setting the FAULT, UVW bits (in DEV_STS register) and VMUV_WARN bit (in SUP_STS register) to 1b. DRV8317 continues to operate as usual. The external controller manages the VM under voltage warn condition by acting appropriately. The reporting clears (nFAULT pin is released, FAULT, UVW and VMUV_WARN bits are set to 0b) when a clear fault command is issued either through the FLT_CLR bit or an nSLEEP reset pulse (t_{RST}).

8.3.11.2.3 VM Under Voltage Warn Disabled (VMUV_WARN_MODE = 11b)

No action is taken and no reporting (nFAULT pin, status register bits) is done after a VM under voltage warn event in this mode.

8.3.11.3 Over Current Protection (OCP)

A MOSFET over current event is sensed by monitoring the current flowing through each of the FETs. If the current through a FET exceeds the OCP threshold (I_{OCP}) for longer than the OCP deglitch time (t_{OCP}), an OCP event is recognized and action is taken according to OCP_MODE. In order to avoid false trigger of OCP at PWM transitions, due to ringing in the phase voltage, there is a blanking time (t_{BLANK}) applied after each PWM edge. During blanking time, OCP events are ignored.

In DRV8317H, the t_{OCP} is fixed at 0.6- μ s (typical), t_{BLANK} is fixed at 0.7- μ s (typical) and the OCP_MODE is set to 001b with retry time of 5-ms. In DRV8317S, the t_{OCP} is configured by OCP_DEG, the t_{BLANK} is configured by OCP_TBLANK and the OCP_MODE can be configured in four different modes: OCP latched shutdown, OCP automatic retry with fast and slow retry times and OCP report only.

Note

($t_{OCP} + t_{BLANK}$) should not exceed 2- μ s

8.3.11.3.1 OCP Latched Fault (OCP_MODE = 010b)

After an OCP event in this mode, all MOSFETs are in Hi-Z and the nFAULT pin is driven low. The FAULT, OCP bits (in DEV_STS register) and corresponding FETs' OCP bits (in DRV_STS register) are set to 1b. Normal operation resumes (pre-driver operation, FAULT, OCP, corresponding FETs' OCP bits set to 0b and the nFAULT pin is released) when a clear fault command is issued either through the FLT_CLR bit or an nSLEEP reset pulse (t_{RST}).

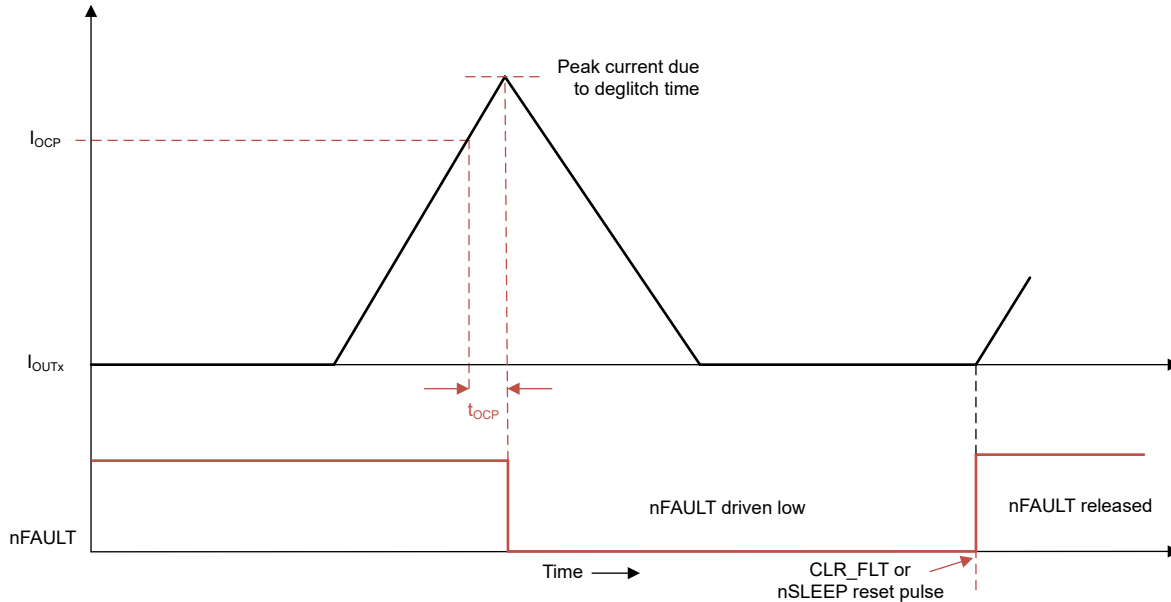

Figure 8-25. Over Current Protection - Latched Mode

8.3.11.3.2 OCP Automatic Retry (OCP_MODE = 000b or 001b)

After an OCP event in this mode, all the FETs are in Hi-Z and the nFAULT pin is driven low. The FAULT, OCP bits (in DEV_STS register) and corresponding FETs' OCP bits (in DRV_STS register) are set to 1b. Normal operation resumes automatically (pre-driver operation, the nFAULT pin is released and corresponding FETs' OCP bits are set to 1b) after the retry time (t_{RETRY}) time elapses. The FAULT and OCP bits stay set to 1b until clear fault command is issued either through the FLT_CLR bit or an nSLEEP reset pulse (t_{RST}).

Retry time (t_{RETRY}) is set by,

- Slow retry time (SLOW_TRETRY) by configuring OCP_MODE to 000b
- Fast retry time (FAST_TRETRY) by configuring OCP_MODE to 001b

Figure 8-26. Over Current Protection - Automatic Retry Mode

8.3.11.3.3 OCP Report Only (OCP_MODE = 011b)

No protective action occurs after an OCP event in this mode. The over current event is reported by driving the nFAULT pin low and setting the FAULT, OCP bits (in DEV_STS register) and corresponding FETs' OCP bits (in DRV_STS register) to 1b. DRV8317 continues to operate as usual. The external controller manages the over current condition by acting appropriately. The reporting clears (nFAULT pin is released, FAULT, OCP, and corresponding FETs' OCP bits are set to 0b) when a clear fault command is issued either through the FLT_CLR bit or an nSLEEP reset pulse (t_{RST}).

8.3.11.4 VM Over Voltage Protection (OVP)

If at any time, input supply voltage on the VM pin rises higher than the V_{OVP} rising threshold, all the integrated FETs are in Hi-Z, FAULT, OVP bits (in DEV_STS register) and VM_OV (in SUP_STS register) are set to 1b and the nFAULT pin is driven low. Normal operation resumes automatically (pre-driver operation and the nFAULT pin is released) once retry time (t_{RETRY}) lapses after VM pin voltage is below the V_{OVP} falling threshold as shown in Figure 8-27. The FAULT, OVP and VM_OV bits stay set to 1b until clear fault command is issued either through the FLT_CLR bit or an nSLEEP reset pulse (t_{RST}).

Retry time (t_{RETRY}) is set by,

- Slow retry time (SLOW_TRETRY) by configuring OVP_MODE to 00b
- Fast retry time (FAST_TRETRY) by configuring OVP_MODE to 01b

IN DRV8317H, OVP_MODE is set to 01b and FAST_TRETRY is fixed at 5-ms.

Figure 8-27. VM Over Voltage Protection

8.3.11.5 SPI Fault

In the event of a SPI transaction fault (parity, frame or bus contention error), if SPLIFLT_MODE is set to 0b, nFAULT is driven low, FAULT, SPIFLT bits (in DEV_STS register) and SPI_PARITY/ BUS_CNT/ FRM_ERR bits (in SYSIF_STS register) are set to 1b. DRV8317 continues to operate as usual. The external controller manages the SPI fault event by acting appropriately. The reporting clears (nFAULT pin is released, FAULT, SPIFLT, and SPI_PARITY/ BUS_CNT/ FRM_ERR bits are set to 0b) when a clear fault command is issued either through the FLT_CLR bit or an nSLEEP reset pulse (t_{RST}).

If SPIFLT_MODE is set to 1b, SPI fault is disabled and reporting (nFAULT, status register bits) does not happen on a SPI fault event.

8.3.11.6 System (OTP Read) Fault

DRV8317 loads the configurable register settings from the OTP on every power-up cycle. If an OTP read fault is encountered while configuring the registers, pre-driver is disabled, FAULT, SYSFLT bits (in DEV_STS register) and OTPLD_ERR bit (in SYSIF_STS register) are set to 1b and nFAULT is driven low. Normal operation resumes (pre-driver, FAULT, SYSFLT, OTPLD_ERR bits set to 0b and nFAULT pin is released) when a clear

fault command is issued either through the FLT_CLR bit or an nSLEEP reset pulse (t_{RST}). It is advisable not to operate DRV8317 by issuing a clear fault command in the event of a OTP read fault since the register settings may be in an unknown state and may lead to unexpected device operation.

8.3.11.7 Thermal Protection

DRV8317 has over temperature warning (OTW) and over temperature shutdown (OTS) features for protection against over temperature events. OTW is available for FET protection (OTW_FET) while OTS is available for FET (OTS_FET) and AVDD LDO (OTS_LDO) protection.

8.3.11.7.1 FET Over Temperature Warning (OTW_FET)

If the FET temperature exceeds the over temperature warning (T_{OTW_FET}) threshold, the FAULT, OTF bits (in DEV_STS register) and OTW_FET bit (in OT_STS register) are set to 1b and the nFAULT pin is driven low. The nFAULT pin is released and OTW_FET is set to 0b once retry time (t_{RETRY}) elapses after the FET temperature falls below the over temperature warning ($T_{OTW_FET} - T_{OTW_FET_HYS}$) threshold. The FAULT, OTF bits stay set to 1b until cleared through the CLR_FLT bit or an nSLEEP reset pulse (t_{RST}).

Retry time (t_{RETRY}) is set by,

- Slow retry time (SLOW_TRETRY) by configuring OTF_MODE to 00b
- Fast retry time (FAST_TRETRY) by configuring OTF_MODE to 01b

In DRV8317H, FET over temperature warning is disabled.

8.3.11.7.2 FET Over Temperature Shutdown (OTS_FET)

If the FET temperature exceeds the shutdown threshold (T_{OTS_FET}), all the integrated FETs are in Hi-Z, the FAULT, OTF bits (in DEV_STS register) and OTS_FET bit (in OT_STS register) are set to 1b and the nFAULT pin is driven low. Normal operation resumes automatically (pre-driver operation, nFAULT pin is released and OTS_FET is set to 0b) after retry time (t_{RETRY}) elapses, if FET temperature falls below the over temperature shutdown ($T_{OTS_FET} - T_{OTS_FET_HYS}$) threshold. The FAULT, OTF bits stay set to 1b until cleared through the CLR_FLT bit or an nSLEEP reset pulse (t_{RST}). This feature cannot be disabled.

Retry time (t_{RETRY}) is set by,

- Slow retry time (SLOW_TRETRY) by configuring OTF_MODE to 00b
- Fast retry time (FAST_TRETRY) by configuring OTF_MODE to 01b

IN DRV8317H, t_{RETRY} period is fixed at 5-ms.

8.3.11.7.3 LDO Over Temperature Shutdown

If AVDD LDO temperature exceeds the LDO over temperature shutdown (T_{OTS_LDO}) threshold, all the integrated FETs are in Hi-Z and device enters reset. Normal operation resumes automatically when AVDD LDO temperature falls below the over temperature shutdown threshold ($T_{OTS_LDO} - T_{OTS_LDO_HYS}$). This feature cannot be disabled.

8.4 Device Functional Modes

8.4.1 Functional Modes

8.4.1.1 Sleep Mode

The nSLEEP pin manages the state of DRV8317. When the nSLEEP pin is low, the device goes to a low-power sleep mode. In sleep mode MOSFETs, current sense amplifiers, charge pump, AVDD regulator and SPI bus are disabled. The t_{SLEEP} time must elapse after a falling edge on the nSLEEP pin before the device goes to sleep mode. The device comes out of sleep mode automatically if the nSLEEP pin is pulled high. The t_{WAKE} time must elapse before the device is ready for PWM inputs.

Note

During power up and power down of the device through the nSLEEP pin, the nFAULT pin is held low as the internal regulators are enabled or disabled. After the regulators have enabled or disabled, the nFAULT pin is automatically released. The duration that the nFAULT pin is low does not exceed the t_{SLEEP} or t_{WAKE} time.

8.4.1.2 Operating Mode

When the nSLEEP pin is high and the V_{VM} voltage is greater than the V_{UVLO} voltage, the device goes to operating mode. The t_{WAKE} time must elapse before the device is ready for inputs. In this mode the charge pump, AVDD regulator and SPI bus are active.

8.4.1.3 Fault Reset (FLT_CLR or nSLEEP Reset Pulse)

In the case of latched faults, DRV8317 turns off the MOSFETs (Hi-Z) and the motor coasts to a stop.

When the fault condition clears, the device can go to the operating state again by either setting the FLT_CLR bit to 1b in the SPI variant or by issuing a reset pulse on the nSLEEP pin in the hardware variant. The nSLEEP reset pulse (t_{RST}) consists of a high-to-low-to-high transition on the nSLEEP pin. The low period of the sequence should fall with the t_{RST} time window or else the device will start the complete shutdown sequence. The reset pulse has no effect on any of the regulators, device settings, or other functional blocks.

8.5 SPI Communication

8.5.1 Programming

8.5.1.1 SPI Format

SPI Format - with Parity

The SDI input data word is 24 bits long and consists of the following format:

- 1 read or write bit, W (bit B23)
- 6 address bits, A (bits B22 through B17)
- Parity bit, P (bit B16)
- 15 data bits with 1 parity bit, D (bits B15 through B0)

The SDO output data word is 24 bits long. The most significant bits are status bits and the least significant 16 bits are the data content of the register being accessed.

Table 8-7. SDI Input Data Word Format for SPI

R/W	ADDRESS						PARITY	PARITY	DATA															
B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0	
W0	A5	A4	A3	A2	A1	A0	P	P	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	

Table 8-8. SDO Output Data Word Format

STATUS								DATA															
B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
S7	S6	S5	S4	S3	S2	S1	S0	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

The details of the bits used in SPI frame format are detailed below.

Read/Write Bit (R/W): R/W (W0) bit set to 0b indicates a SPI write transaction. For a SPI read operation, R/W bit needs to be set to 1b.

Address Bits (A): A SPI secondary device takes a 6-bit register address.

Parity Bit (P): Both header and data fields of a SPI input data frame include a parity bit for single bit error detection - in [Table 8-7](#), B16 is parity bit for the header field, while B15 is the parity bit for the data field. The

parity scheme used is even parity - the number of ones in a block of 16-bits (including the parity bit) is even. Data will be written to the internal registers only if the parity check is successful. Parity checks can be enabled or disabled by configuring the SPI_PEN bit of SYS_CTRL register. Parity checks are disabled by default.

Note

Though parity checks are disabled by default, TI recommends enabling parity checks to safeguard against single-bit errors.

Error Handling

Parity Error: Upon detecting a parity error, the secondary device responds in the following ways. Parity error gets latched and reported on nFAULT. The error status is available for read on SPI_PARITY field of SYS_STS register. A parity error in the header will not prevent the secondary device from responding with data. The SDO will be driven by the secondary device being addressed. Updates to write address pointer and the device registers will be ignored when parity error is detected. In a sequential write, upon detection of parity error any subsequent register writes will be ignored.

Frame Error: Any incomplete SPI Frame will be reported as Frame error. Frame errors will be latched in FRM_ERR field of SYSIF_STS register and indicated on nFAULT.

SPI Read/Write Sequence

SPI Read Sequence: The SPI read transaction comprises of an 8-bit header (R/W - 1 bit, Address - 6 bits, and parity -1 bit) followed by 16-bit dummy data words. Upon receiving the first byte of header, the secondary device responds with an 8-bit device status information. The read address pointer gets updated immediately after receiving the address field of the header. The read address from the header acts as the starting address for the register reads. The read address pointer gets incremented automatically upon completion of a 16-bit transfer. The length of data transfer is not restricted by the secondary device. The secondary device responds with data as long as the primary device transmits dummy words. If parity error check is enabled, the MSB of read data will be replaced with computed parity bit

SPI Write Sequence: SPI write transaction comprises of an 8-bit header followed by 16-bit data words to be written into the register bank. Similar to a read transaction, the addressed secondary device responds with an 8-bit device status information upon receiving the first byte of header. Once the header bytes are received, the write address pointer gets updated. The write address from the header acts as the starting address for sequential register writes. The read address pointer will retain the address of the register being read in the previous SPI transaction. The length of data transfer is not restricted by the secondary device. Both read and write address pointers will be incremented automatically upon completion of a 16-bit transfer. While receiving data from the primary device, the SDO will be driven with the register data addressed by read address pointer.

8.6 DRV8317 Registers

Table 8-9 lists the memory-mapped registers for the DRV8317 registers. All register offset addresses not listed in Table 8-9 should be considered as reserved locations and the register contents should not be modified.

Table 8-9. DRV8317 Registers

Offset	Acronym	Register Name	Section
0h	DEV_STS	Device Status Register	Section 8.6.1
2h	DEV_RSTS	Device Raw Status Register	Section 8.6.2
4h	OT_STS	Over Temperature Status Register	Section 8.6.3
5h	SUP_STS	Supply Status Register	Section 8.6.4
6h	DRV_STS	Driver Status Register	Section 8.6.5

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The DRV8317 can be used to drive brushless-DC motors. The following design procedure can be used to configure the DRV8317.

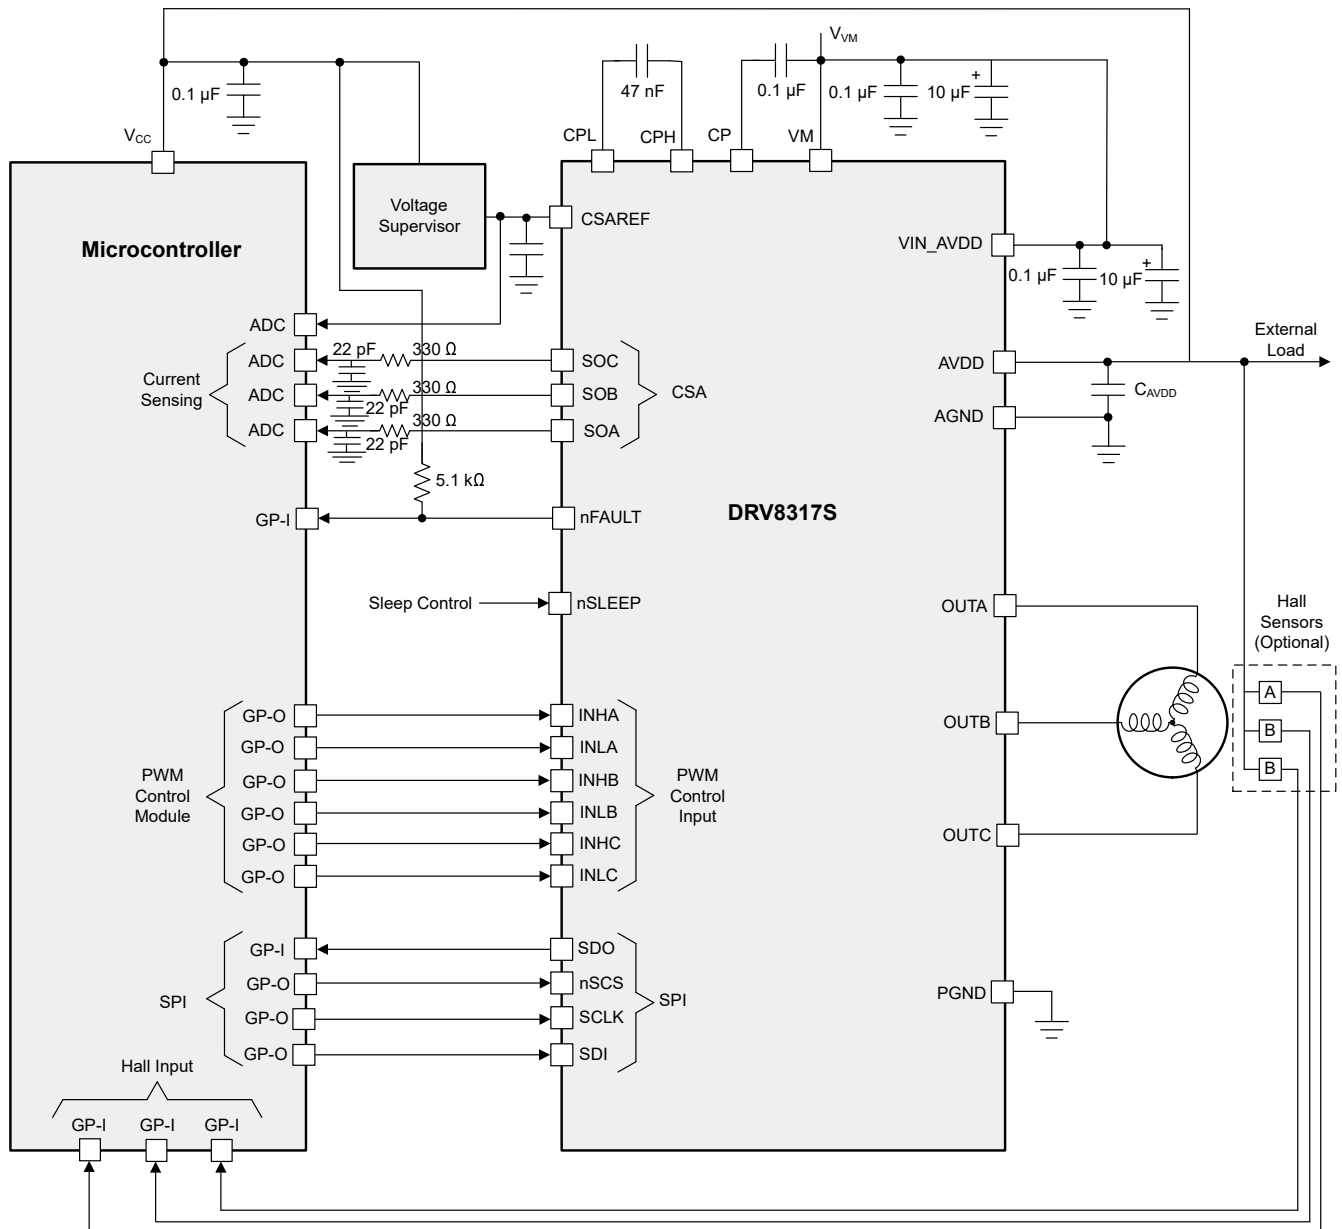

Figure 9-1. Application Schematics (DRV8317S)

9.2 Typical Applications

9.2.1 Three-Phase Brushless-DC Motor Control

In this application, the DRV8317 is used to drive a brushless-DC motor using PWMs from an external microcontroller.

9.2.1.1 Detailed Design Procedure

Table 9-1 lists the example input parameters for the system design.

Table 9-1. Design Parameters

DESIGN PARAMETERS	REFERENCE	EXAMPLE VALUE
Supply voltage	V_{VM}	12 V
Motor RMS current	I_{RMS}	2 A
Motor peak current	I_{PEAK}	3 A
PWM Frequency	f_{PWM}	50 kHz
Slew Rate Setting	SR	200 V/ μ s
VIN_AVDD supply voltage	V_{VIN_AVDD}	12 V
CSA reference voltage	V_{CSA_REF}	3.0 V
System ambient temperature	T_A	-20°C to +50°C

9.2.1.1.1 Motor Voltage

Brushless-DC motors are typically rated for a certain voltage (for example, 5V or 12V). The DRV8317 allows for a range of possible operating voltages from 4.5-V to 20-V.

9.2.1.2 Driver Propagation Delay and Dead Time

The propagation delay is defined as the time taken for changing input logic edges INHx and INLx (whichever changes first, if MCU dead time is added) to change the half-bridge output voltage (OUTx). Driver propagation delay (t_{PD}) and dead time (t_{dead}) are specified with a typical and maximum value, but not with a minimum value. This is because the propagation delay can be smaller than typical depending on the direction of current at the OUTx pin during synchronous switching. Driver propagation delay and dead time can be more than typical values due to slower internal turn-on of the high-side or low-side internal MOSFETs to avoid parasitic dV/dt coupling.

For more information and examples of how propagation delay and dead time differs for input PWM and output configurations, refer to [Delay and Dead Time in Integrated MOSFET Drivers](#).

The dead time from the external microcontroller's (MCU) PWM inputs (INHx, INLx) can be used as an extra precaution in addition to the DRV8317 internal shoot-through (cross conduction) protection. If the MCU dead time is less than the DRV8317 driver dead time, actual output (OUTx voltage) dead time will be decided by the DRV8317 dead time (t_{DEAD}). If the MCU dead time is larger than the driver dead time, actual output (OUTx voltage) dead time will be decided by the MCU dead time.

A summary of the DRV8317 delay times with respect to synchronous inputs INHx and INLx, OUTx current direction, and MCU dead time are listed in [Table 9-2](#).

Table 9-2. Summary of Delay Times in DRV8317 Depending on Logic Inputs and Output Current Direction

OUTx Current Direction	INHx	INLx	Propagation Delay (t_{PD})	Dead Time (t_{DEAD})	Inserted MCU Dead Time ($t_{DEAD(MCU)}$)	
					$t_{DEAD(MCU)} \leq t_{DEAD}$	$t_{DEAD(MCU)} > t_{DEAD}$
Out of OUTx	Rising	Falling	$\leq t_{PD} (max)$	$\leq t_{DEAD} (max)$	Output dead time $\leq t_{DEAD} (max)$	Output dead time = $t_{DEAD(MCU)}$
	Falling	Rising	$\leq t_{PD} (typ.)$	$\leq t_{DEAD} (typ.)$	Output dead time $\leq t_{DEAD} (typ.)$	Output dead time < $t_{DEAD(MCU)}$

Table 9-2. Summary of Delay Times in DRV8317 Depending on Logic Inputs and Output Current Direction (continued)

OUTx Current Direction	INHx	INLx	Propagation Delay (t _{PD})	Dead Time (t _{DEAD})	Inserted MCU Dead Time (t _{DEAD(MCU)})	
					t _{DEAD(MCU)} ≤ t _{DEAD}	t _{DEAD(MCU)} > t _{DEAD}
Into OUTx	Rising	Falling	≤ t _{PD} (typ.)	≤ t _{DEAD} (typ.)	Output dead time ≤ t _{DEAD} (typ.)	Output dead time < t _{DEAD(MCU)}
	Falling	Rising	≤ t _{PD} (max)	≤ t _{DEAD} (max)	Output dead time ≤ t _{DEAD} (max)	Output dead time = t _{DEAD(MCU)}

9.2.1.3 Delay Compensation

Differences in delays of dead time and propagation delay can cause mismatch in the output timings of PWMs, which can lead to duty cycle distortion. In order to accommodate differences in propagation delay between the conditions mentioned in [Table 9-2](#), DRV8317 integrates a delay compensation feature.

Delay compensation is used to match delay times for currents going into and out of phase (OUTx) by adding a variable delay time (t_{var}) to match a preset target delay time equal to the propagation delay plus driver dead time (t_{PD} + t_{DRV_DEAD}). This (t_{var}) setting is automatically configured by the DRV8317 when the DLYCMP_EN bit is set to 1b.

9.2.1.4 Current Sensing and Output Filtering

The SOx pins are typically sampled by an analog-to-digital converter in the MCU to calculate the phase current. Phase current information is used for closed-loop control such as Field-Oriented Control (FOC).

An example calculation for phase current is shown in [Equation 3](#).

$$SOx = V_{REF}/2 + G_{CSA} * I_{OUTx} \quad (3)$$

For example, in a system with VREF = 3-V, CSA gain = 0.5 V/A, and a SOx voltage of 1.2-V, phase current (I_{OUTx}) = -0.6A.

Sometimes high frequency noise can appear at the SOx signals based on voltage ripple at VREF, added inductance at the SOx traces, or routing of SOx traces near high frequency components. It is recommended to add a low-pass RC filter close to the MCU with cut-off frequency at least 10 times the PWM switching frequency for trapezoidal commutation and 100 times the PWM switching frequency for sinusoidal commutation to filter high frequency noise. A recommended RC filter is 330-ohms, 22-pF to add minimal parallel capacitance to the ADC and current mirroring circuitry without increasing the settling time of the CSA output.

The cutoff frequency for the low-pass RC filter is in [Equation 4](#).

$$f_c = \frac{1}{2\pi RC} \quad (4)$$

9.2.1.5 Application Curves

Figure 9-2. Device Power up with VM (VM, nFAULT, nSLEEP, AVDD)

Figure 9-3. Device Power up with nSLEEP (VM, nFAULT, nSLEEP, AVDD)

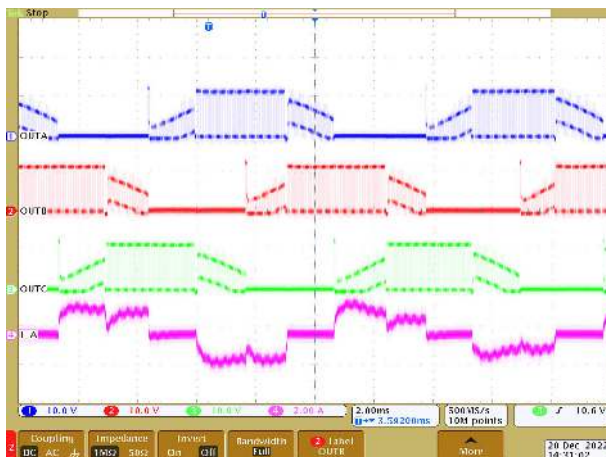

Figure 9-4. Driver PWM Operation (OUTA, OUTB, OUTC, I_A)

Figure 9-5. Driver PWM Operation with Current Sense Feedback (INHA, OUTA, SOA, I_A)

9.3 Alternate Applications

The DRV8317 can be used to drive brushed-DC motors and solenoid loads. The following design procedure can be used to configure the DRV8317.

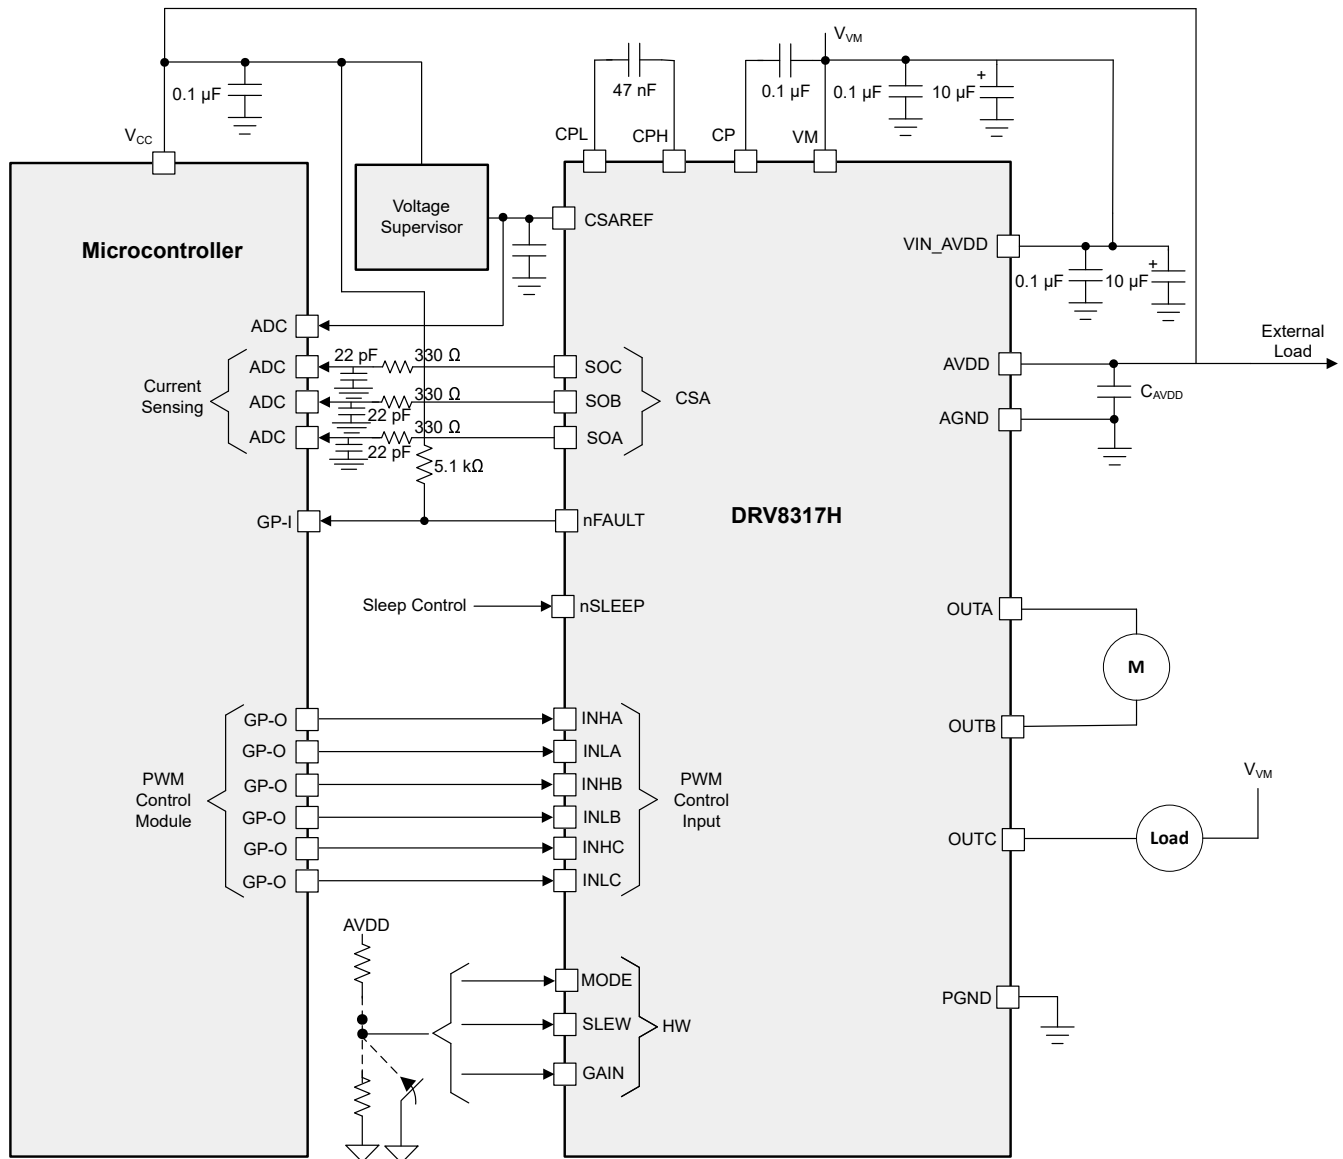

Figure 9-6. Application Schematics (DRV8317H) - Brushed-DC and Solenoid Load Drive Block Diagram

6x PWM mode or 3x PWM mode can be used to drive brushed-DC and/or solenoid loads depending on the application. A Brushed-DC motor can be connected to two OUTx phases to create an integrated full H-bridge configuration to drive the motor in both direction.

Solenoid loads can be connected from OUTx to VM or GND to use the DRV8317 as a push-pull driver in 6x PWM or 3x PWM mode. When the load is connected from OUTx to GND, the HS MOSFET sources current into the solenoid, and the LS MOSFET acts as a recirculation diode to recirculate current from the solenoid. When the load is connected from OUTx to VM, the LS MOSFET sink current from the solenoid to GND, and the HS MOSFET acts as a recirculation diode to recirculate current from the solenoid.

10 Power Supply Recommendations

10.1 Bulk Capacitance

Having an appropriate local bulk capacitance is an important factor in motor drive system design. It is generally beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The capacitance and current capability of the power supply
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed dc, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and the motor drive system limits the rate current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

Figure 10-1. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

11 Layout

11.1 Layout Guidelines

The bulk capacitor should be placed to minimize the distance of the high-current path through the motor driver device. The connecting metal trace widths should be as wide as possible, and numerous vias should be used when connecting PCB layers. These practices minimize inductance and allow the bulk capacitor to deliver high current.

Small-value capacitors should be ceramic, and placed closely to device pins including, AVDD, charge pump, CSAREF, VINA VDD and VM.

The high-current device outputs should use wide metal traces.

To reduce noise coupling and EMI interference from large transient currents into small-current signal paths, grounding should be partitioned between PGND and AGND. TI recommends connecting all non-power stage circuitry (including the thermal pad) to AGND to reduce parasitic effects and improve power dissipation from the device. Ensure grounds are connected through net-ties to reduce voltage offsets and maintain gate driver performance. A common ground plane can also be used for PGND and AGND to minimize inductance in the grounding, but it is recommended to place motor switching outputs as far away from analog and digital signals so motor noise does not couple into the analog and digital circuits.

The device thermal pad should be soldered to the PCB top-layer ground plane. Multiple vias should be used to connect to a large bottom-layer ground plane. The use of large metal planes and multiple vias helps dissipate the heat that is generated in the device.

To improve thermal performance, maximize the ground area that is connected to the thermal pad ground across all possible layers of the PCB. Using thick copper pours can lower the junction-to-air thermal resistance and improve thermal dissipation from the die surface.

[Figure 11-1](#) shows a recommended layout example.

11.2 Layout Example

Figure 11-1. Recommended Layout Example

11.3 Thermal Considerations

The DRV8317 has thermal shutdown (OTS) as previously described. A die temperature in excess of 145°C (min.) can disable the device until the temperature drops to a safe level.

Any tendency of the device to enter thermal shutdown is an indication of excessive power dissipation, insufficient heatsinking, or too high an ambient temperature.

11.3.1 Power Dissipation and Junction Temperature Estimation

Power Dissipation

The power loss in DRV8317 include standby losses, LDO losses, FET conduction and switching losses, and diode losses. The FET conduction loss dominates the total power dissipation in DRV8317. At start-up and fault conditions, the output current is much higher than normal current; remember to take these peak currents and their duration into consideration. The total device dissipation is the power dissipated in each of the three half bridges added together. The maximum amount of power that the device can dissipate depends on ambient temperature and heatsinking. Note that $R_{DS,ON}$ increases with temperature, so as the device heats, the power dissipation increases. Take this into consideration when designing the PCB and heatsinking.

A summary of equations for calculating each loss is listed in [Table 11-1](#) for trapezoidal control and field-oriented control.

Table 11-1. DRV8317 Power Losses for Trapezoidal and Field-oriented Control

Loss type	Trapezoidal control	Field-oriented control
Standby power	$P_{standby} = V_{VM} \times I_{VMS}$	
AVDD LDO	$P_{LDO} = (V_{VIN_AVDD} - V_{AVDD}) \times I_{AVDD}$	
FET conduction	$P_{CON} = 2 \times (I_{PK(trap)})^2 \times R_{DS,ON(TJ)}$	$P_{CON} = 3 \times (I_{RMS(FOC)})^2 \times R_{DS,ON(TJ)}$
FET switching	$P_{SW} = I_{PK(trap)} \times V_{PK(trap)} \times t_{rise/fall} \times f_{PWM}$	$P_{SW} = 3 \times I_{RMS(FOC)} \times V_{PK(FOC)} \times t_{rise/fall} \times f_{PWM}$
Diode (dead time)	$P_{diode} = 2 \times I_{PK(trap)} \times V_{F(diode)} \times t_{DEAD} \times f_{PWM}$	$P_{diode} = 6 \times I_{RMS(FOC)} \times V_{F(diode)} \times t_{DEAD} \times f_{PWM}$

Note

$R_{DS,ON(TJ)}$ is the on-state resistance of a single FET at operating junction temperature.

Junction Temperature Estimation

To calculate the junction temperature of the die from power losses, use [Equation 5](#). Note that the thermal resistance $R_{\theta JA}$ depends on PCB configuration such as the numbers of PCB layers, copper thickness, ground plane area and the PCB size.

$$T_J(^{\circ}C) = P_{LOSS}(W) \times R_{\theta JA}(^{\circ}C/W) + T_A(^{\circ}C) \quad (5)$$

Refer to [BLDC integrated MOSFET thermal calculator](#) for estimating the approximate device power dissipation and junction temperature at different use cases.

12 Device and Documentation Support

12.1 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

12.2 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

12.3 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.4 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated device. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

REE0036A

PACKAGE OUTLINE

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

REE0036A

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

EXAMPLE STENCIL DESIGN

REE0036A

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV8317HREER	ACTIVE	WQFN	REE	36	5000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	DRV 8317H	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
