Si5326

ANY-FREQUENCY PRECISION CLOCK MULTIPLIER/JITTER ATTENUATOR

Features

- Generates any frequency from 2 kHz to 945 MHz and select frequencies to 1.4 GHz from an input frequency of 2 kHz to 710 MHz
- Ultra-low jitter clock outputs with jitter generation as low as 0.3 ps rms (50 kHz–80 MHz)
- Integrated loop filter with selectable loop bandwidth (60 Hz to 8.4 kHz)
- Meets OC-192 GR-253-CORE jitter specifications
- Dual clock inputs with manual or automatically controlled hitless switching (LVPECL, LVDS, CML, CMOS)
- Dual clock outputs with selectable signal format
- Support for ITU G.709 and custom FEC ratios (255/238, 255/237, 255/236)
- LOL, LOS, FOS alarm outputs
- Digitally-controlled output phase adjustment
- I^2C or SPI programmable
- On-chip voltage regulator for 1.8 ±5%, 2.5 ±10%, or 3.3 V ±10% operation
- Small size: 6 x 6 mm 36-lead QFN
- Pb-free, ROHS compliant

Applications

- SONET/SDH OC-48/OC-192/STM-16/STM-64 line cards
- ITU G.709 and custom FEC line cards
- GbE/10GbE, 1/2/4/8/10G Fibre Channel line cards
- GbE/10GbE Synchronous Ethernet
- Optical modules
- Wireless basestations
- Data converter clocking
- xDSL
- PDH clock synthesis
- Test and measurement
- Broadcast video

Description

The Si5326 is a jitter-attenuating precision clock multiplier for applications requiring sub 1 ps jitter performance. The Si5326 accepts two input clocks ranging from 2 kHz to 710 MHz and generates two output clocks ranging from 2 kHz to 945 MHz and select frequencies to 1.4 GHz. The two outputs are divided down separately from a common source.

The Si5326 can also use its crystal oscillator as a clock source for frequency synthesis. The device provides virtually any frequency translation combination across this operating range. The Si5326 input clock frequency and clock multiplication ratio are programmable through an I^2C or SPI interface.

The Si5326 is based on Skyworks Solutions' 3rd-generation DSPLL® technology, which provides frequency synthesis and jitter attenuation in a highly integrated PLL solution that eliminates the need for external VCXO and loop filter components. The DSPLL loop bandwidth is digitally programmable, providing jitter performance optimization at the application level. Operating from a single 1.8, 2.5, or 3.3 V supply, the Si5326 is ideal for providing clock multiplication and jitter attenuation in high performance timing applications.

Ordering Information:

See page 65.

4. Functional Description

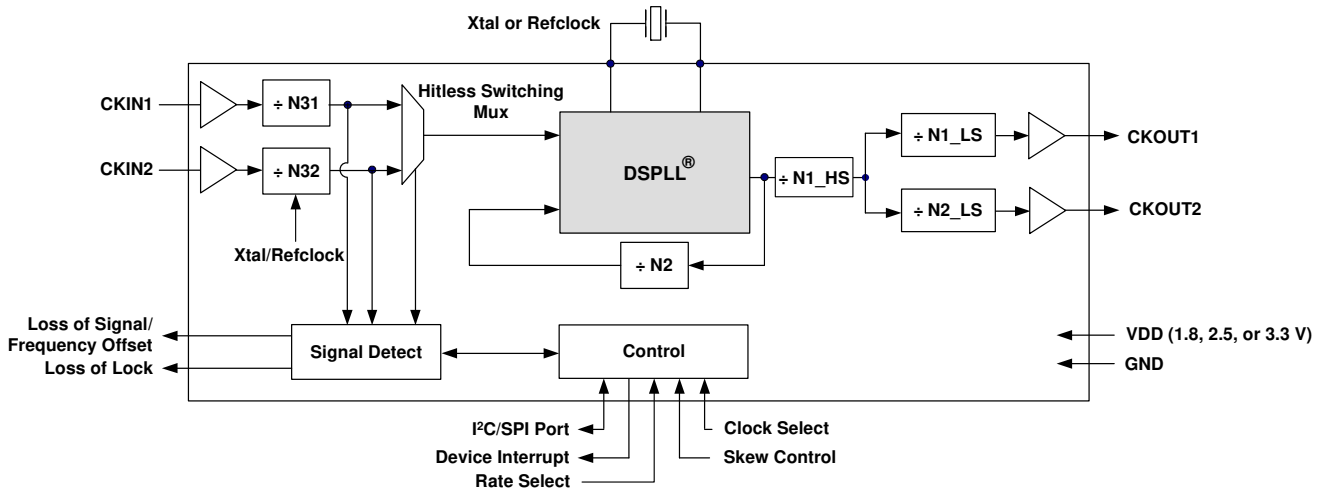

Figure 6. Functional Block Diagram

The Si5326 is a jitter-attenuating precision clock multiplier for applications requiring sub 1 ps jitter performance. The Si5326 accepts two input clocks ranging from 2 kHz to 710 MHz and generates two output clocks ranging from 2 kHz to 945 MHz and select frequencies to 1.4 GHz. The Si5326 can also use its crystal oscillator as a clock source for frequency synthesis. The device provides virtually any frequency translation combination across this operating range. Independent dividers are available for each input clock and output clock, so the Si5326 can accept input clocks at different frequencies and it can generate output clocks at different frequencies. The Si5326 input clock frequency and clock multiplication ratio are programmable through an I^2C or SPI interface.

Skyworks Solutions offers a PC-based software utility, DSPLL*sim*, that can be used to determine the optimum PLL divider settings for a given input frequency/clock multiplication ratio combination that minimizes phase noise and power consumption.

This utility can be downloaded from https://www.skyworksinc.com/en/Products/Timing-Jitter-Attenuators.

The Si5326 is based on Skyworks Solutions' 3rd-generation DSPLL® technology, which provides any frequency synthesis and jitter attenuation in a highly integrated PLL solution that eliminates the need for external VCXO and loop filter components. The Si5326 PLL loop bandwidth is digitally programmable and supports a range from 60 Hz to 8.4 kHz. The DSPLL*sim* software utility can be used to calculate valid loop bandwidth settings for a given input clock frequency/clock multiplication ratio.

The Si5326 supports hitless switching between the two synchronous input clocks in compliance with GR-253-CORE that greatly minimizes the propagation of phase transients to the clock outputs during an input clock transition (maximum 200 ps phase change). Manual and automatic revertive and non-revertive input clock switching options are available.

The Si5326 monitors both input clocks for loss-of-signal (LOS) and provides a LOS alarm (INT_C1B and C2B) when it detects missing pulses on either input clock. The device monitors the lock status of the PLL. The lock detect algorithm works by continuously monitoring the phase of the input clock in relation to the phase of the feedback clock.

The Si5326 also monitors frequency offset alarms (FOS), which indicate if an input clock is within a specified frequency band relative to the frequency of a reference clock. Both Stratum 3/3E and SONET Minimum Clock (SMC) FOS thresholds are supported.The Si5326 provides a digital hold capability that allows the device to continue generation of a stable output clock when the selected input reference is lost. During digital hold, the DSPLL generates an output frequency based on a historical average frequency that existed for a fixed amount of time before the error event occurred, eliminating the effects of phase and frequency transients that may occur immediately preceding digital hold.

The Si5326 has two differential clock outputs. The electrical format of each clock output is independently programmable to support LVPECL, LVDS, CML, or CMOS loads. If not required, the second clock output can be powered down to minimize power consumption. The phase difference between the selected input clock and the output clocks is adjustable in 200 ps increments for system skew control using the *CLAT*[7:0] register. Fine phase adjustment is available and is set using the *FLAT* register bits. The nominal range and resolution of the *FLAT*[14:0] skew adjustment word are: ±110 ps and 3 ps, respectively. In addition, the phase of one output clock may be adjusted in relation to the phase of the other output clock. The resolution varies from 800 ps to 2.2 ns depending on the PLL divider settings. See Table 8 for instructions on ensuring output-to-output alignment. The input to output skew is not specified. The DSPLL*sim* software utility determines the phase offset resolution for a given input clock/clock multiplication ratio combination. For system-level debugging, a bypass mode is available which drives the output clock directly from the input clock, bypassing the internal DSPLL. The device is powered by a single 1.8, 2.5, or 3.3 V supply.

4.1. External Reference

An external, high quality clock or a low-cost 114.285 MHz 3rd overtone crystal is used as part of a fixed-frequency oscillator within the DSPLL. This external reference is required for the device to perform jitter attenuation. Skyworks Solutions recommends using a high quality crystal. Specific recommendations may be found in the Family Reference Manual.

In digital hold, the DSPLL remains locked and tracks the external reference. Note that crystals can have temperature sensitivities.

4.2. Further Documentation

Consult the Skyworks Solutions Si53xx Any Frequency Precision Clock Family Reference Manual (FRM) for detailed information about the Si5326 functions. Additional design support is available from Skyworks Solutions through your distributor.

Skyworks Solutions has developed a PC-based software utility called DSPLL*sim* to simplify device configuration, including frequency planning and loop bandwidth selection.

The FRM and this utility can be downloaded from https://www.skyworksinc.com/en/Products/Timing-Jitter-Attenuators.

Table 8. CKOUT_ALWAYS_ON and SQ_ICAL Truth Table

CKOUT_ALWAYS_ON	SQ_ICAL	Results
0	0	CKOUT OFF until after the first ICAL
0	1	CKOUT OFF until after the first successful ICAL (i.e., when LOL is low)
1	0	CKOUT always ON, including during an ICAL
1	1	CKOUT always ON, including during an ICAL. Use these settings to preserve output-to-output skew

5. Register Map

All register bits that are not defined in this map should always be written with the specified Reset Values. The writing to these bits of values other than the specified Reset Values may result in undefined device behavior. Registers not listed, such as Register 64, should never be written to.

Register	D7	D6	D5	D4	D3	D2	D1	D0
0		FREE_RUN	CKOUT_ ALWAYS_ ON				BYPASS_ REG	
1					CK_PRIOR2[1:0]		CK_PRIOR[1:0]	
2	BWSEL_REG[3:0]							
3	CKSEL_REG[1:0]		DHOLD	SQ_ICAL

6. Register Descriptions

Register 0.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name		FREE_ RUN	CKOUT_ ALWAYS_ ON				BYPASS_ REG	
Type	R	R/W	R/W	R	R	R	R/W	R

Reset value = 0001 0100

Bit	Name	Function
7	Reserved	**Reserved.**
6	FREE_RUN	**Free Run.** Internal to the device, route XA/XB to CKIN2. This allows the device to lock to its XA-XB reference. 0: Disable 1: Enable
5	CKOUT_ ALWAYS_ON	**CKOUT Always On.** This will bypass the SQ_ICAL function. Output will be available even if SQ_ICAL is on and ICAL is not complete or successful. See Table 8 on page 19. 0: Squelch output until part is calibrated (ICAL). 1: Provide an output. Note: The frequency may be significantly off and variable until the part is calibrated.
4:2	Reserved	**Reserved.**
1	BYPASS_ REG	**Bypass Register.** This bit enables or disables the PLL bypass mode. Use only when the device is in digital hold or before the first ICAL. 0: Normal operation 1: Bypass mode. Selected input clock is connected to CKOUT buffers, bypassing the PLL. Bypass mode does not support CMOS clock outputs.
0	Reserved	**Reserved.**

Register 1.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	Reserved				CK_PRIOR2 [1:0]		CK_PRIOR1 [1:0]	
Type	R				R/W		R/W	

Reset value = 1110 0100

Bit	Name	Function
7:4	Reserved	**Reserved.**
3:2	CK_PRIOR2 [1:0]	**CK_PRIOR 2.** Selects which of the input clocks will be 2nd priority in the autoselection state machine. 00: CKIN1 is 2nd priority. 01: CKIN2 is 2nd priority. 10: Reserved 11: Reserved
1:0	CK_PRIOR1 [1:0]	**CK_PRIOR 1.** Selects which of the input clocks will be 1st priority in the autoselection state machine. 00: CKIN1 is 1st priority. 01: CKIN2 is 1st priority. 10: Reserved 11: Reserved

Register 2.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	BWSEL_REG [3:0]				Reserved			
Type	R/W				R			

Reset value = 0100 0010

Bit	Name	Function
7:4	BWSEL_REG [3:0]	**BWSEL_REG.** Selects nominal f3dB bandwidth for PLL. See DSPLL*sim* for settings. After BWSEL_REG is written with a new value, an ICAL is required for the change to take effect.
3:0	Reserved	**Reserved.**

Register 3.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	CKSEL_REG [1:0]		DHOLD	SQ_ICAL	Reserved			
Type	R/W		R/W	R/W	R			

Reset value = 0000 0101

Bit	Name	Function
7:6	CKSEL_REG [1:0]	**CKSEL_REG.** If the device is operating in register-based manual clock selection mode (AUTOSEL_REG = 00), and CKSEL_PIN = 0, then these bits select which input clock will be the active input clock. If CKSEL_PIN = 1 and AUTOSEL_REG = 00, the CS_CA input pin continues to control clock selection and CKSEL_REG is of no consequence. 00: CKIN_1 selected. 01: CKIN_2 selected. 10: Reserved 11: Reserved
5	DHOLD	**DHOLD.** Forces the part into digital hold. This bit overrides all other manual and automatic clock selection controls. 0: Normal operation. 1: Force digital hold mode. Overrides all other settings and ignores the quality of all of the input clocks.
4	SQ_ICAL	**SQ_ICAL.** This bit determines if the output clocks will remain enabled or be squelched (disabled) during an internal calibration. See Table 8 on page 19. 0: Output clocks enabled during ICAL. 1: Output clocks disabled during ICAL.
3:0	Reserved	**Reserved.**

Register 4.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	AUTOSEL_REG [1:0]		Reserved	HIST_DEL [4:0]				
Type	R/W		R	R/W				

Reset value = 0001 0010

Bit	Name	Function
7:6	AUTOSEL_ REG [1:0]	**AUTOSEL_REG [1:0].** Selects method of input clock selection to be used. 00: Manual (either register or pin controlled, see CKSEL_PIN) 01: Automatic Non-Revertive 10: Automatic Revertive 11: Reserved See the Si53xx Family Reference Manual for a detailed description.
5	Reserved	**Reserved.**
4:0	HIST_DEL [4:0]	**HIST_DEL [4:0].** Selects amount of delay to be used in generating the history information used for Digital Hold. See the Si53xx Family Reference Manual for a detailed description.

Register 5.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	ICMOS [1:0]		Reserved					
Type	R/W		R					

Reset value = 1110 1101

Bit	Name	Function
7:6	ICMOS [1:0]	**ICMOS [1:0].** When the output buffer is set to CMOS mode, these bits determine the output buffer drive strength. The first number below refers to 3.3 V operation; the second to 1.8 V operation. These values assume CKOUT+ is tied to CKOUT-. 00: 8mA/2mA 01: 16mA/4mA 10: 24mA/6mA 11: 32mA/8mA
5:0	Reserved	**Reserved.**

Register 6.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	Reserved	SLEEP	SFOUT2_REG [2:0]			SFOUT1_REG [2:0]		
Type	R	R/W	R/W			R/W		

Reset value = 0010 1101

Bit	Name	Function
7	Reserved	**Reserved.**
6	SLEEP	**SLEEP.** In sleep mode, all clock outputs are disabled and the maximum amount of internal circuitry is powered down to reduce power dissipation and noise generation. This bit overrides the SFOUTn_REG[2:0] output signal format settings. 0: Normal operation 1: Sleep mode
5:3	SFOUT2_ REG [2:0]	**SFOUT2_REG [2:0].** Controls output signal format and disable for CKOUT2 output buffer. 000: Reserved 001: Disable 010: CMOS (Bypass mode not supported) 011: Low swing LVDS 100: Reserved 101: LVPECL 110: CML 111: LVDS **Note:** LVPECL requires a nominal $V_{DD} \geq 2.5$ V.
2:0	SFOUT1_ REG [2:0]	**SFOUT1_REG [2:0].** Controls output signal format and disable for CKOUT1 output buffer. 000: Reserved 001: Disable 010: CMOS (Bypass mode not supported) 011: Low swing LVDS 100: Reserved 101: LVPECL 110: CML 111: LVDS **Note:** LVPECL requires a nominal $V_{DD} \geq 2.5$ V.

Register 7.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	Reserved					FOSREFSEL [2:0]		
Type	R					R/W		

Reset value = 0010 1010

Bit	Name	Function
7:3	Reserved.	**Reserved.**
2:0	FOSREFSEL [2:0]	**FOSREFSEL [2:0].** Selects which input clock is used as the reference frequency for frequency offset (FOS) alarms. 000: XA/XB (External reference) 001: CKIN1 010: CKIN2 011: Reserved 100: Reserved 101: Reserved 110: Reserved 111: Reserved

Register 8.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	HLOG_2[1:0]		HLOG_1[1:0]		Reserved			
Type	R/W		R/W		R			

Reset value = 0000 0000

Bit	Name	Function
7:6	HLOG_2 [1:0]	**HLOG_2 [1:0].** 00: Normal operation 01: Holds CKOUT2 output at static logic 0. Entrance and exit from this state will occur without glitches or runt pulses. 10: Holds CKOUT2 output at static logic 1. Entrance and exit from this state will occur without glitches or runt pulses. 11: Reserved
5:4		**HLOG_1 [1:0].** 00: Normal operation 01: Holds CKOUT1 output at static logic 0. Entrance and exit from this state will occur without glitches or runt pulses. 10: Holds CKOUT1 output at static logic 1. Entrance and exit from this state will occur without glitches or runt pulses. 11: Reserved
3:0	Reserved	**Reserved.**

Register 9.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	HIST_AVG [4:0]					Reserved		
Type	R/W					R	R	R

Reset value = 1100 0000

Bit	Name	Function
7:3	HIST_AVG [4:0]	**HIST_AVG [4:0].** Selects amount of averaging time to be used in generating the history information for Digital Hold. See the Si53xx Family Reference Manual for a detailed description
2:0	Reserved	**Reserved.**

Register 10.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	Reserved				DSBL2_ REG	DSBL1_ REG	Reserved	Reserved
Type	R				R/W	R/W	R	R

Reset value = 0000 0000

Bit	Name	Function
7:4	Reserved	**Reserved.**
3	DSBL2_REG	**DSBL2_REG.** This bit controls the powerdown of the CKOUT2 output buffer. If disable mode is selected, the N2_LS output divider is also powered down. 0: CKOUT2 enabled 1: CKOUT2 disabled
2	DSBL1_REG	**DSBL1_REG.** This bit controls the powerdown of the CKOUT1 output buffer. If disable mode is selected, the N1_LS output divider is also powered down. 0: CKOUT1 enabled 1: CKOUT1 disabled
1:0	Reserved	**Reserved.**

Register 11.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	Reserved						PD_CK2	PD_CK1
Type	R						R/W	R/W

Reset value = 0100 0000

Bit	Name	Function
7:2	Reserved	**Reserved.**
1	PD_CK2	**PD_CK2.** This bit controls the powerdown of the CKIN2 input buffer. 0: CKIN2 enabled 1: CKIN2 disabled
0	PD_CK1	**PD_CK1.** This bit controls the powerdown of the CKIN1 input buffer. 0: CKIN1 enabled 1: CKIN1 disabled

Register 16.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	CLAT [7:0]							
Type	R/W							

Reset value = 0000 0000

Bit	Name	Function
7:0	CLAT [7:0]	**CLAT [7:0].** With INCDEC_PIN = 0, this register sets the phase delay for CKOUTn in units of 1/Fosc. This can take as long as 20 seconds. 01111111 = 127/Fosc (2s compliment) 00000000 = 0 10000000 = -128/Fosc (2s compliment) If NI_HS[2:0] = 000, increasing CLAT does not work.

Register 17.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	FLAT_ VALID	FLAT [14:8]						
Type	R/W	R/W						

Reset value = 1000 0000

Bit	Name	Function
7	FLAT_VALID	**FLAT_VALID.** Before writing a new FLAT[14:0] value, this bit must be set to zero, which causes the existing FLAT[14:0] value to be held internally for use while the new value is being written. Once the new FLAT[14:0] value is completely written, set FLAT_VALID = 1 to enable its use. 0: Memorize existing FLAT[14:0] value and ignore intermediate register values during write of new FLAT[14:0] value. 1: Use FLAT[14:0] value directly from registers.
6:0	FLAT [14:8]	**FLAT [14:8].** Fine resolution control for overall device skew from input clocks to output clocks. Positive values increase the skew. See DSPLL*sim* for details. FLAT [14:0] is a 2's complement number.

Register 18.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	FLAT [7:0]							
Type	R/W							

Reset value = 0000 0000

Bit	Name	Function
7:0	FLAT [7:0]	**FLAT [7:0].** Fine resolution control for overall device skew from input clocks to output clocks. Positive values increase the skew. See DSPLL*sim* for details. FLAT [14:0] is a 2's complement number.

Register 19.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	FOS_EN	FOS_THR [1:0]		VALTIME [1:0]		LOCKT [2:0]		
Type	R/W	R/W		R/W		R/W		

Reset value = 0010 1100

Bit	Name	Function
7	FOS_EN	**FOS_EN.** Frequency Offset Enable globally disables FOS. See the individual FOS enables (FOSX-_EN, register 139). 0: FOS disable 1: FOS enabled by FOSx_EN
6:5	FOS_THR [1:0]	**FOS_THR [1:0].** Frequency Offset at which FOS is declared (relative to the selected FOS reference): 00: ± 11 to 12 ppm (Stratum 3/3E compliant, with a Stratum 3/3E used for REFCLK 01: ± 48 to 49 ppm (SMC) 10: ± 30 ppm (SONET Minimum Clock (SMC), with a Stratum 3/3E used for REFCLK. 11: ± 200 ppm
4:3	VALTIME [1:0]	**VALTIME [1:0].** Sets amount of time for input clock to be valid before the associated alarm is removed. 00: 2 ms 01: 100 ms 10: 200 ms 11: 13 seconds
2:0	LOCKT [2:0]	**LOCKT [2:0].** Sets retrigger interval for one shot monitoring phase detector output. One shot is triggered by phase slip in DSPLL. Refer to the Si53xx Family Reference Manual for more details. 000: 106 ms 001: 53 ms 010: 26.5 ms 011: 13.3 ms 100: 6.6 ms 101: 3.3 ms 110: 1.66 ms 111: .833 ms

Register 20.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	Reserved				CK2_BAD_PIN	CK1_BAD_PIN	LOL_PIN	INT_PIN
Type	R				R/W	R/W	R/W	R/W

Reset value = 0011 1110

Bit	Name	Function
7:4	Reserved	**Reserved.**
3	CK2_BAD_PIN	**CK2_BAD_PIN.** The CK2_BAD status can be reflected on the C2B output pin. 0: C2B output pin tristated 1: C2B status reflected to output pin
2	CK1_BAD_PIN	**CK1_BAD_PIN.** Either LOS1 or INT (see INT_PIN) status can be reflected on the INT_C1B output pin. 0: INT_C1B output pin tristated 1: LOS1 or INT (see INT_PIN) status reflected to output pin
1	LOL_PIN	**LOL_PIN.** The LOL_INT status bit can be reflected on the LOL output pin. 0: LOL output pin tristated 1: LOL_INT status reflected to output pin
0	INT_PIN	**INT_PIN.** Reflects the interrupt status on the INT_C1B output pin. 0: Interrupt status not displayed on INT_C1B output pin. Instead, the INT_C1B pin indicates when CKIN1 is bad. If CK1_BAD_PIN = 0, INT_C1B output pin is tristated. 1: Interrupt status reflected to output pin.

Register 21.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	INCDEC_ PIN	Reserved					CK1_ACT-V_PIN	CKSEL_ PIN
Type	R/W	Force 1	R	R	R	R	R/W	R/W

Reset value = 1111 1111

Bit	Name	Function
7	INCDEC_PIN	**INCDEC_PIN.** Determines how coarse skew adjustments can be made. The adjustments can be made via hardware using the INC/DEC pins or via software using the CLAT register. 0: INC and DEC inputs ignored; use CLAT register to adjust skew. 1: INC and DEC inputs control output phase increment/decrement.
6:2	Reserved	**Reserved.**
1	CK1_ACTV_ PIN	**CK1_ACTV_PIN.** The CK1_ACTV_REG status bit can be reflected to the CS_CA output pin using the CK1_ACTV_PIN enable function. CK1_ACTV_PIN is of consequence only when pin controlled clock selection is being used. (See CKSEL_PIN) 0: CS_CA output pin tristated. 1: Clock Active status reflected to output pin.
0	CKSEL_PIN	**CKSEL_PIN.** If manual clock selection is being used, clock selection can be controlled via the CKSEL_REG[1:0] register bits or the CS_CA input pin. This bit is only active when AUTOSEL_REG = Manual. 0: CS_CA pin is ignored. CKSEL_REG[1:0] register bits control clock selection. 1: CS_CA input pin controls clock selection.

Register 22.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	Reserved				CK_ACTV_POL	CK_BAD_POL	LOL_POL	INT_POL
Type	R				R/W	R/W	R/W	R/W

Reset value = 1101 1111

Bit	Name	Function
7:4	Reserved	**Reserved.**
3	CK_ACTV_POL	**CK_ACTV_POL.** Sets the active polarity for the CS_CA signals when reflected on an output pin. 0: Active low 1: Active high
2	CK_BAD_POL	**CK_BAD_POL.** Sets the active polarity for the INT_C1B and C2B signals when reflected on output pins. 0: Active low 1: Active high
1	LOL_POL	**LOL_POL.** Sets the active polarity for the LOL status when reflected on an output pin. 0: Active low 1: Active high
0	INT_POL	**INT_POL.** Sets the active polarity for the interrupt status when reflected on the INT_C1B output pin. 0: Active low 1: Active high

Register 23.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	Reserved					LOS2_ MSK	LOS1_ MSK	LOSX_ MSK
Type	R					R/W	R/W	R/W

Reset value = 0001 1111

Bit	Name	Function
7:3	Reserved	**Reserved.**
2	LOS2_MSK	**LOS2_MSK.** Determines if a LOS on CKIN2 (LOS2_FLG) is used in the generation of an interrupt. Writes to this register do not change the value held in the LOS2_FLG register. 0: LOS2 alarm triggers active interrupt on INT_C1B output (if INT_PIN=1). 1: LOS2_FLG ignored in generating interrupt output.
1	LOS1_MSK	**LOS1_MSK.** Determines if a LOS on CKIN1 (LOS1_FLG) is used in the generation of an interrupt. Writes to this register do not change the value held in the LOS1_FLG register. 0: LOS1 alarm triggers active interrupt on INT_C1B output (if INT_PIN=1). 1: LOS1_FLG ignored in generating interrupt output.
0	LOSX_MSK	**LOSX_MSK.** Determines if a LOS on XA/XB(LOSX_FLG) is used in the generation of an interrupt. Writes to this register do not change the value held in the LOSX_FLG register. 0: LOSX alarm triggers active interrupt on INT_C1B output (if INT_PIN=1). 1: LOSX_FLG ignored in generating interrupt output.

Register 24.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	Reserved					FOS2_ MSK	FOS1_ MSK	LOL_MSK
Type	R					R/W	R/W	R/W

Reset value = 0011 1111

Bit	Name	Function
7:3	Reserved	**Reserved.**
2	FOS2_MSK	**FOS2_MSK.** Determines if the FOS2_FLG is used in the generation of an interrupt. Writes to this register do not change the value held in the FOS2_FLG register. 0: FOS2 alarm triggers active interrupt on INT_C1B output (if INT_PIN=1). 1: FOS2_FLG ignored in generating interrupt output.
1	FOS1_MSK	**FOS1_MSK.** Determines if the FOS1_FLG is used in the generation of an interrupt. Writes to this register do not change the value held in the FOS1_FLG register. 0: FOS1 alarm triggers active interrupt on INT_C1B output (if INT_PIN=1). 1: FOS1_FLG ignored in generating interrupt output.
0	LOL_MSK	**LOL_MSK.** Determines if the LOL_FLG is used in the generation of an interrupt. Writes to this register do not change the value held in the LOL_FLG register. 0: LOL alarm triggers active interrupt on INT_C1B output (if INT_PIN=1). 1: LOL_FLG ignored in generating interrupt output.

Register 25.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	N1_HS [2:0]			Reserved				
Type	R/W			R				

Reset value = 0010 0000

Bit	Name	Function
7:5	N1_HS [2:0]	**N1_HS [2:0].** Sets value for N1 high speed divider which drives NCn_LS (n = 1 to 2) low-speed divider. 000: N1= 4 Note: Changing the coarse skew via the INC pin or CLAT register is disabled for this value. 001: N1= 5 010: N1= 6 011: N1= 7 100: N1= 8 101: N1= 9 110: N1= 10 111: N1= 11

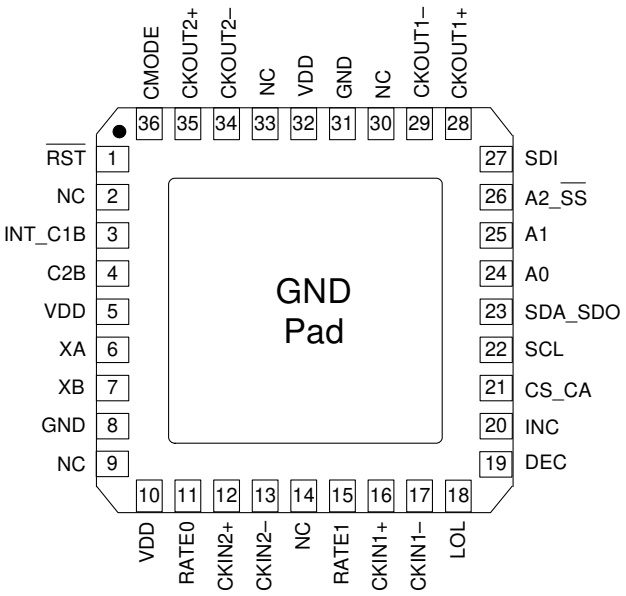
7. Pin Descriptions: Si5326



Pin #	Pin Name	I/O	Signal Level	Description
1	$\overline{\text{RST}}$	I	LVCMOS	**External Reset.** Active low input that performs external hardware reset of device. Resets all internal logic to a known state and forces the device registers to their default value. Clock outputs are tristated during reset. The part must be programmed after a reset or power on to get a clock output. See the Si53xx Family Reference Manual for details. This pin has a weak pull-up.
2, 9, 14, 30, 33	NC	—	—	**No Connection.** Leave floating. Make no external connections to this pin for normal operation.
3	INT_C1B	O	LVCMOS	**Interrupt/CKIN1 Invalid Indicator.** This pin functions as a device interrupt output or an alarm output for CKIN1. If used as an interrupt output, *INT_PIN* must be set to 1. The pin functions as a maskable interrupt output with active polarity controlled by the *INT_POL* register bit. If used as an alarm output, the pin functions as a LOS (and optionally FOS) alarm indicator for CKIN1. Set *CK1_BAD_PIN* = 1 and *INT_PIN* = 0. 0 = CKIN1 present 1 = LOS (FOS) on CKIN1 The active polarity is controlled by *CK_BAD_POL*. If no function is selected, the pin tristates.
Note: Internal register names are indicated by underlined italics, e.g., *INT_PIN*. See Section “5.Register Map”.				

Pin #	Pin Name	I/O	Signal Level	Description
4	C2B	O	LVCMOS	**CKIN2 Invalid Indicator.** This pin functions as a LOS (and optionally FOS) alarm indicator for CKIN2 if *CK2_BAD_PIN* = 1. 0 = CKIN2 present 1 = LOS (FOS) on CKIN2 The active polarity can be changed by *CK_BAD_POL*. If *CK2_BAD_PIN* = 0, the pin tristates.
5, 10, 32	V_{DD}	V_{DD}	Supply	**Supply.** The device operates from a 1.8, 2.5, or 3.3 V supply. Bypass capacitors should be associated with the following V_{DD} pins: 5 0.1 µF 10 0.1 µF 32 0.1 µF A 1.0 µF should also be placed as close to the device as is practical.
7 6	XB XA	I	Analog	**External Crystal or Reference Clock.** External crystal should be connected to these pins to use internal oscillator based reference. Refer to the Si53xx Family Reference Manual for interfacing to an external reference. External reference must be from a high-quality clock source (TCXO, OCXO). Frequency of crystal or external clock is set by RATE[1:0] pins.
8, 31	GND	GND	Supply	**Ground.** Must be connected to system ground. Minimize the ground path impedance for optimal performance of this device. Grounding these pins does not eliminate the requirement to ground the GND PAD on the bottom of the package.
11 15	RATE0 RATE1	I	3-Level	**External Crystal or Reference Clock Rate.** Three level inputs that select the type and rate of external crystal or reference clock to be applied to the XA/XB port. Refer to the Si53xx Family Reference Manual for settings. These pins have both a weak pull-up and a weak pull-down; they default to M. L setting corresponds to ground. M setting corresponds to $V_{DD}/2$. H setting corresponds to V_{DD}. **Note:** Tying the corresponding $Rate_n$ pins to HH (V_{DD}) provides compatibility to Si5325. Refer to Si5325 data sheet for operating in this mode. Some designs may require an external resistor voltage divider when driven by an active device that will tristate.
16 17	CKIN1+ CKIN1–	I	Multi	**Clock Input 1.** Differential input clock. This input can also be driven with a single-ended signal. Input frequency range is 2 kHz to 710 MHz.
12 13	CKIN2+ CKIN2–	I	Multi	**Clock Input 2.** Differential input clock. This input can also be driven with a single-ended signal. Input frequency range is 2 kHz to 710 MHz.
Note: Internal register names are indicated by underlined italics, e.g., *INT_PIN*. See Section “5.Register Map”.				

Pin #	Pin Name	I/O	Signal Level	Description
18	LOL	O	LVCMOS	**PLL Loss of Lock Indicator.** This pin functions as the active high PLL loss of lock indicator if the LOL_PIN register bit is set to 1. 0 = PLL locked 1 = PLL unlocked If *LOL_PIN* = 0, this pin will tristate. Active polarity is controlled by the *LOL_POL* bit. The PLL lock status will always be reflected in the *LOL_INT* read only register bit.
19	DEC	I	LVCMOS	**Skew Decrement.** A pulse on this pin decreases the input to output device skew by $1/f_{OSC}$ (approximately 200 ps). There is no limit on the range of skew adjustment by this method. Pin control is enabled by setting *INCDEC_PIN* = 1. If *INCDEC_PIN* = 0, this pin is ignored and output skew is controlled via the *CLAT* register. If both INC and DEC are tied high, phase buildout is disabled and the device maintains a fixed-phase relationship between the selected input clock and the output clock during an input clock switch. See the Si53xx Family Reference Manual for more details. This pin has a weak pull-down.
20	INC	I	LVCMOS	**Skew Increment.** A pulse on this pin increases the input to output device skew by $1/f_{OSC}$ (approximately 200 ps). There is no limit on the range of skew adjustment by this method. Pin control is enabled by setting *INCDEC_PIN* = 1. If *INCDEC_PIN* = 0, this pin is ignored and output skew is controlled via the *CLAT* register. If both INC and DEC are tied high, phase buildout is disabled and the device maintains a fixed-phase relationship between the selected input clock and the output clock during an input clock switch. See the Si53xx Family Reference Manual for more details. **Note:** INC does not increase skew if NI_HS = 4. This pin has a weak pull-down.

Note: Internal register names are indicated by underlined italics, e.g., *INT_PIN*. See Section “5.Register Map”.

Pin #	Pin Name	I/O	Signal Level	Description
21	CS_CA	I/O	LVCMOS	**Input Clock Select/Active Clock Indicator.** **Input**: In manual clock selection mode, this pin functions as the manual input clock selector if the *CKSEL_PIN* is set to 1. 0 = Select CKIN1 1 = Select CKIN2 If *CKSEL_PIN* = 0, the *CKSEL_REG* register bit controls this function and this input tristates. If configured for input, must be tied high or low. **Output**: In automatic clock selection mode, this pin indicates which of the two input clocks is currently the active clock. If alarms exist on both clocks, CK_ACTV will indicate the last active clock that was used before entering the digital hold state. The *CK_ACTV_PIN* register bit must be set to 1 to reflect the active clock status to the CK_ACTV output pin. 0 = CKIN1 active input clock 1 = CKIN2 active input clock If *CK_ACTV_PIN* = 0, this pin will tristate. The CK_ACTV status will always be reflected in the *CK_ACTV_REG* read only register bit.
22	SCL	I	LVCMOS	**Serial Clock.** This pin functions as the serial clock input for both SPI and I^2C modes. This pin has a weak pull-down.
23	SDA_SDO	I/O	LVCMOS	**Serial Data.** In I^2C control mode (CMODE = 0), this pin functions as the bidirectional serial data port. In SPI control mode (CMODE = 1), this pin functions as the serial data output.
25 24	A1 A0	I	LVCMOS	**Serial Port Address.** In I^2C control mode (CMODE = 0), these pins function as hardware controlled address bits. The I^2C address is 1101 [A2] [A1] [A0]. In SPI control mode (CMODE = 1), these pins are ignored. These pins have a weak pull-down.
26	A2_$\overline{SS}$	I	LVCMOS	**Serial Port Address/Slave Select.** In I^2C control mode (CMODE = 0), this pin functions as a hardware controlled address bit [A2]. In SPI control mode (CMODE = 1), this pin functions as the slave select input. This pin has a weak pull-down.
27	SDI	I	LVCMOS	**Serial Data In.** In I^2C control mode (CMODE = 0), this pin is ignored. In SPI control mode (CMODE = 1), this pin functions as the serial data input. This pin has a weak pull-down.

Note: Internal register names are indicated by underlined italics, e.g., *INT_PIN*. See Section “5.Register Map”.

Pin #	Pin Name	I/O	Signal Level	Description
29 28	CKOUT1– CKOUT1+	O	Multi	**Output Clock 1.** Differential output clock with a frequency range of 2 kHz to 1.4 GHz. Output signal format is selected by *SFOUT1_REG* register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
34 35	CKOUT2– CKOUT2+	O	Multi	**Output Clock 2.** Differential output clock with a frequency range of 2 kHz to 1.4 GHz. Output signal format is selected by *SFOUT2_REG* register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
36	CMODE	I	LVCMOS	**Control Mode.** Selects I^2C or SPI control mode for the Si5326. 0 = I^2C Control Mode 1 = SPI Control Mode This pin must not be NC. Tie either high or low. See the Si53xx Family Reference Manual for details on I^2C or SPI operation.
GND PAD	GND	GND	Supply	**Ground Pad.** The ground pad must provide a low thermal and electrical impedance to a ground plane.
Note: Internal register names are indicated by underlined italics, e.g., *INT_PIN*. See Section “5.Register Map”.				

Table 9 lists all of the register locations that should be followed by an ICAL after their contents are changed.

Table 9. Register Locations Requiring ICAL

Addr	Register
0	BYPASS_REG

8. Ordering Guide

Ordering Part Number	Output Clock Frequency Range	Package	ROHS6, Pb-Free	Temperature Range
Si5326A-C-GM	2 kHz–945 MHz 970–1134 MHz 1.213–1.4 GHz	36-Lead 6 x 6 mm QFN	Yes	–40 to 85 °C
Si5326B-C-GM	2 kHz–808 MHz	36-Lead 6 x 6 mm QFN	Yes	–40 to 85 °C
Si5326C-C-GM	2 kHz–346 MHz	36-Lead 6 x 6 mm QFN	Yes	–40 to 85 °C
Si5325/26-EVB		Evaluation Board		

Note: Add an R at the end of the device to denote tape and reel options.

9. Package Outline: 36-Pin QFN

Figure 7 illustrates the package details for the Si5326. Table 11 lists the values for the dimensions shown in the illustration.

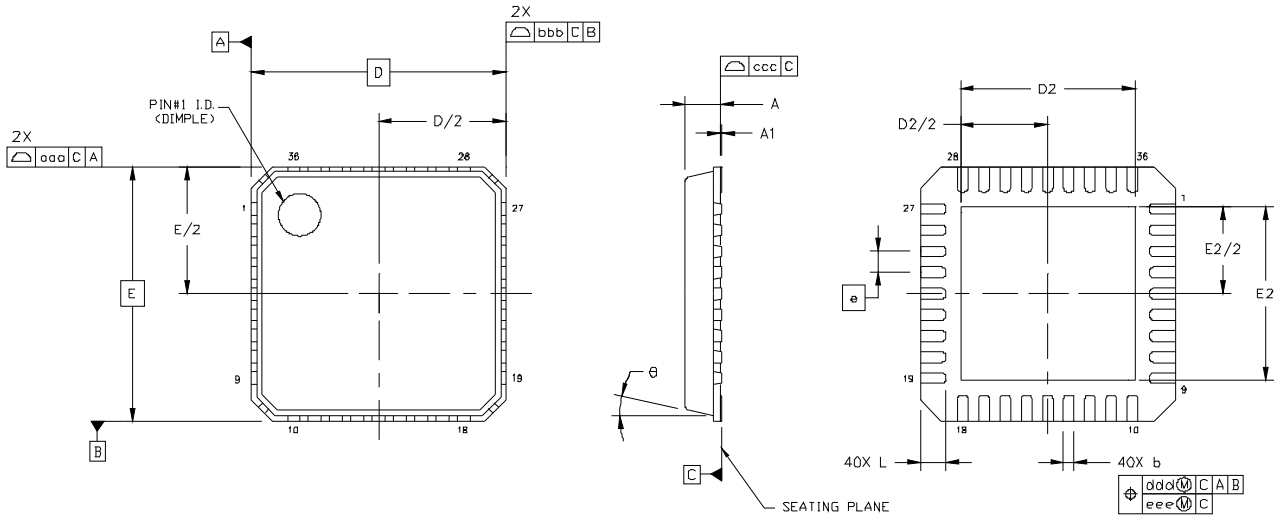

Figure 7. 36-Pin Quad Flat No-lead (QFN)

Table 11. Package Dimensions

Symbol	Millimeters		
	Min	Nom	Max
A	0.80	0.85	0.90
A1	0.00	0.02	0.05
b	0.18	0.25	0.30
D		6.00 BSC	
D2	3.95	4.10	4.25
e		0.50 BSC	
E		6.00 BSC	
E2	3.95	4.10	4.25

Symbol	Millimeters		
	Min	Nom	Max
L	0.50	0.60	0.70
θ	—	—	12º
aaa	—	—	0.10
bbb	—	—	0.10
ccc	—	—	0.08
ddd	—	—	0.10
eee	—	—	0.05

Notes:

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This drawing conforms to JEDEC outline MO-220, variation VJJD.
4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020C specification for Small Body Components.

10. Recommended PCB Layout

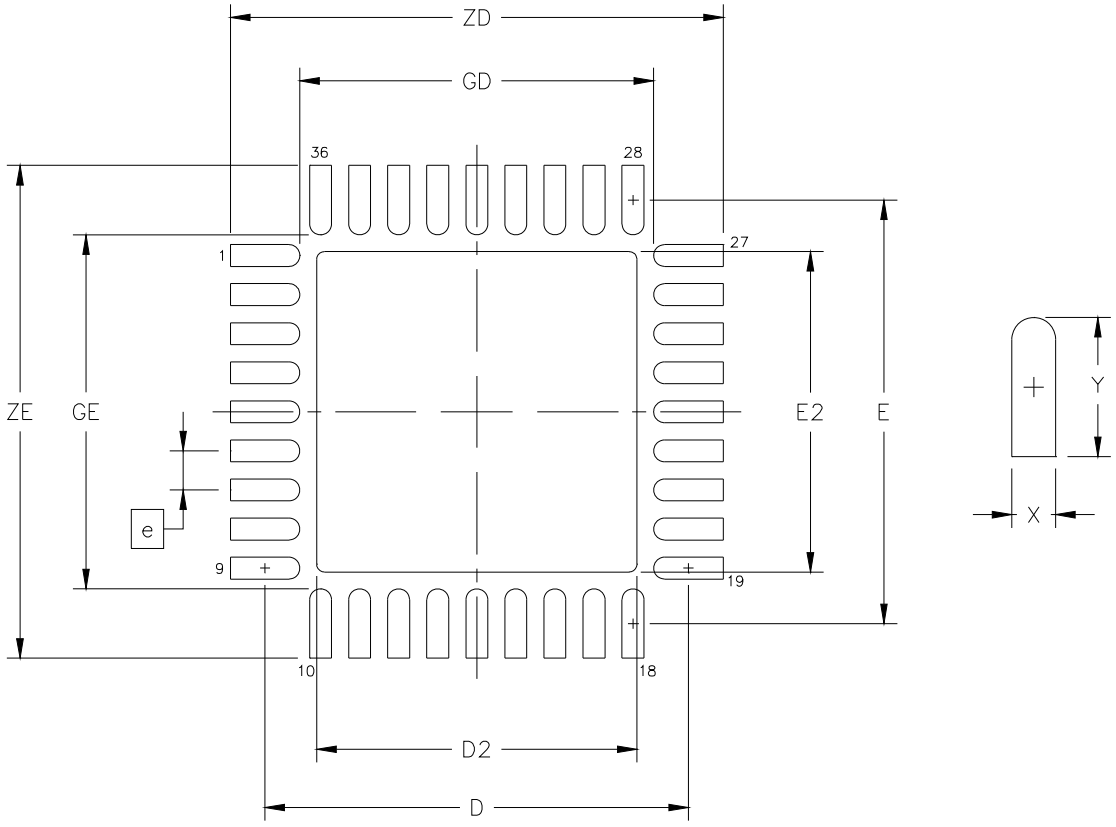

Figure 8. PCB Land Pattern Diagram

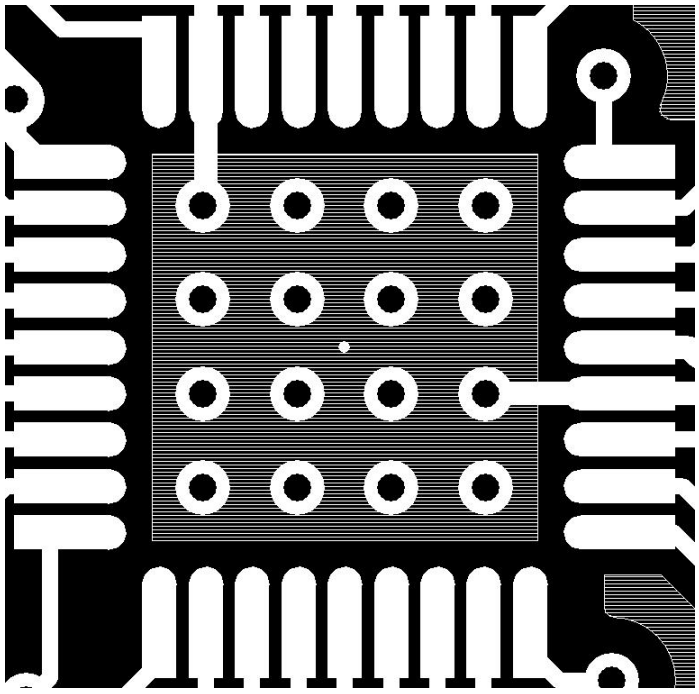

Figure 9. Ground Pad Recommended Layout

Table 12. PCB Land Pattern Dimensions

Dimension	MIN	MAX
e	0.50 BSC.	
E	5.42 REF.	
D	5.42 REF.	
E2	4.00	4.20
D2	4.00	4.20
GE	4.53	—
GD	4.53	—
X	—	0.28
Y	0.89 REF.	
ZE	—	6.31
ZD	—	6.31

Notes (General):

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing is per the ANSI Y14.5M-1994 specification.
3. This Land Pattern Design is based on IPC-SM-782 guidelines.
4. All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition (LMC) is calculated based on a Fabrication Allowance of 0.05 mm.

Notes (Solder Mask Design):

1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 µm minimum, all the way around the pad.

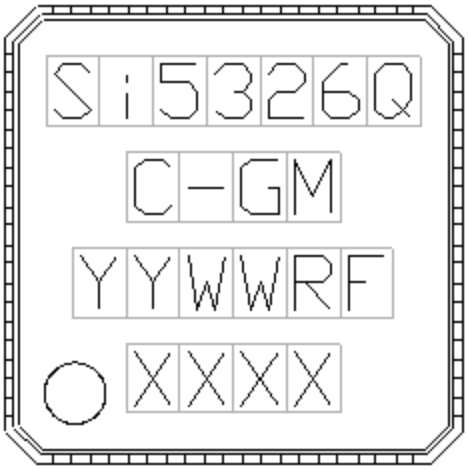
Notes (Stencil Design):

1. A stainless steel, laser-cut, and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for the perimeter pads.
4. A 4 x 4 array of 0.80 mm square openings on 1.05 mm pitch should be used for the center ground pad.

Notes (Card Assembly):

1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020C specification for Small Body Components.

11. Si5326 Device Top Mark



Mark Method:	Laser	
Font Size:	0.80 mm Right-Justified	
Line 1 Marking:	Si5326Q	Customer Part Number Q = Speed Code: A, B, C See Ordering Guide for options
Line 2 Marking:	C-GM	C = Product Revision G = Temperature Range –40 to 85 °C (RoHS6) M = QFN Package
Line 3 Marking:	YYWWRF	YY = Year WW = Work Week R = Die Revision F = Internal code Assigned by the Assembly House. Corresponds to the year and work week of the mold date.
Line 4 Marking:	Pin 1 Identifier	Circle = 0.75 mm Diameter Lower-Left Justified
	XXXX	Internal Code

Document Change List

Revision 0.1 to Revision 0.2

- Updated LVTTL to LVCMOS is Table 2, “Absolute Maximum Ratings,” on page 6.
- Added Figure 3, “Typical Phase Noise Plot,” on page 16.
- Updated Figure 4, “Si5326 Typical Application Circuit (I^2C Control Mode),” and Figure 5, “Si5326 Typical Application Circuit (SPI Control Mode),” on page 17 to show preferred external reference interface.
- Updated “5.Register Map”.
  - Added RATE0 and changed RATE to RATE1 and expanded RATE[1:0] description.
  - Changed font of register names to *underlined italics*.
- Updated "8. Ordering Guide" on page 65.
- Added "9. Package Outline: 36-Pin QFN" on page 66.
- Added “10.Recommended PCB Layout”.

Revision 0.2 to Revision 0.3

- Changed 1.8 V operating range to ±5%.
- Updated Table 1 on page 4.
- Updated Table 2 on page 6.
- Updated Table 11 on page 66.
- Added table under Figure 3 on page 16.
- Updated "4. Functional Description" on page 18.
- Clarified "5. Register Map" on page 20 including pull-up/pull-down.

Revision 0.3 to Revision 0.4

- Updated Table 1 on page 4.
- Added "11. Si5326 Device Top Mark" on page 69.

Revision 0.4 to Revision 0.41

- Changed “latency” to “skew” throughout.
- Updated Table 1 on page 4.
  - Updated Thermal Resistance Junction to Ambient typical specification.
- Updated Figure 4 on page 17.
- Updated Figure 5, “Si5326 Typical Application Circuit (SPI Control Mode),” on page 17.
- Updated "5. Register Map" on page 20.
- Updated "9. Package Outline: 36-Pin QFN" on page 66.
- Added Figure 9, “Ground Pad Recommended Layout,” on page 67
- Added Register Map

Revision 0.41 to Revision 0.42

- Text added to section "5. Register Map" on page 20.

Revision 0.42 to Revision 0.43

- Replaced Figure 9.
- Updated Rise/Fall time values.

Revision 0.43 to Revision 0.44

- Changed register address labels to decimal.

Revision 0.44 to Revision 1.0

- Updated first page format to add chip image and pin out.
- Updated Functional Block Diagram.
- Updated Section “1.Electrical Specifications” to include ac/dc specifications from the Si53xx Family Reference Manual (FRM).
- Updated typical phase noise performance in Section “2.Typical Phase Noise Performance”.
- Added INC/DEC pins to Figure 4 and Figure 5
- Clarified the format for FLAT [14:0].
- Added list of weak pull up/down resistors in Table 10, “Si5326 Pull up/Pull down,” on page 64.
- Updated register maps 19, 20, 46, 47, 55, 142, 143, 185.
- Added note to typical application circuits in Section “3.Typical Application Circuit”
- Added evaluation board part number to “8.Ordering Guide”.
- Updated Section “11.Si5326 Device Top Mark”
- Updated Table 5, “Jitter Generation,” on page 14; filled in all TBDs, and lowered typical RMS values.

SKYWORKS®

ClockBuilder Pro

Customize Skyworks clock generators, jitter attenuators and network synchronizers with a single tool. With CBPro you can control evaluation boards, access documentation, request a custom part number, export for in-system programming and more!
