

# NCS2250, NCV2250, NCS2252, NCV2252

## Comparator, High Speed, 50 ns, Low Voltage, Rail-to-Rail

The NCS2250 and NCS2252 low voltage comparators feature fast response time and rail-to-rail input and output. The extended common mode input voltage range allows input signals 200 mV above and below the rails, allowing voltage detection at ground or the supply. A propagation delay of 50 ns with a 100 mV overdrive makes this comparator suitable for applications requiring faster response times.

These single channel devices are available with a complementary push-pull output in the NCS2250 or with an open drain output in the NCS2252. Both options are offered in TSOP-5 (SOT23-5) and SC-88A (SC70-5) packages. Automotive qualified devices are also available, denoted by the NCV prefix.

### Features

- Propagation Delay: 50 ns with 100 mV Overdrive
- Rail-to-rail Input:  $V_{SS} - 200 \text{ mV}$  to  $V_{DD} + 200 \text{ mV}$
- Supply Voltage: 1.8 V to 5.5 V
- Supply Current: 150  $\mu\text{A}$  Typical at 5 V Supply
- Available with Push-pull or Open Drain Output
- Packages: TSOP-5 (SOT23-5) and SC-88A (SC70-5)
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-free, Halogen Free/BFR Free and are RoHS Compliant

### Applications

- Voltage Threshold Detector
- Zero-crossing Detectors
- High-speed Sampling Circuits
- Logic Level Shifting / Translation
- Clock and Data Signal Restoration

### End Products

- Automotive
- Lighting
- Smartphones, cell phones
- Portable and battery-powered systems
- Power supplies

**Table 2. PIN DESCRIPTION**

Name	Type	Description
V <sub>DD</sub>	Power	Positive supply pin. Connect to positive rail. A bypass capacitor of at least 0.1 μF is recommended as close as possible to the V <sub>DD</sub> pin
V <sub>SS</sub>	Power	Negative supply pin. Connect to ground or negative rail. If not connected to ground, a bypass capacitor of at least 0.1 μF is recommended as close as possible to the V <sub>SS</sub> pin
OUT	Output	Output pin. NCS2250 has a complementary push-pull output stage. NCS2252 has an open drain output stage which requires an external pull-up resistor
IN-	Input	Inverting input
IN+	Input	Non-inverting input

# NCS2250, NCV2250, NCS2252, NCV2252

**Table 3. ABSOLUTE MAXIMUM RATINGS** (Note 2)

Rating	Symbol	Value	Units
Supply Voltage Range ( $V_{DD} - V_{SS}$ )	$V_S$	0 to 6	V
Input Voltage Range	$V_{IN}$	$V_{SS} - 0.3$ to $V_{DD} + 0.3$	V
Output Voltage Range	$V_O$	$V_{SS} - 0.3$ to $V_{DD} + 0.3$	V
Output Short Circuit Current (Note 3)	$I_{SC}$	Continuous	mA
Maximum Junction Temperature (Note 4)	$T_{J(max)}$	+150	°C
Storage Temperature Range	Tstg	-65 to +150	°C
ESD Capability (Note 5)			V
Human Body Model	HBM	2000	
Machine Model	MM	50	
Latch-up Current (Note 6)	$I_{LU}$	100	mA
Moisture Sensitivity Level (Note 7)	MSL	Level 1	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

2. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
3. Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C. Output currents in excess of ±50 mA over long term may adversely affect reliability.
4. See APPLICATION INFORMATION for Safe Operating Area.
5. This device series incorporates ESD protection and is tested by the following methods:
  - ESD Human Body Model tested per JEDEC standard JESD22-A114 (AEC-Q100-002)
  - ESD Machine Model tested per JEDEC standard JESD22-A115 (AEC-Q100-003)
6. Latch-up Current per JEDEC standard JESD78.
7. Moisture Sensitivity Level tested per IPC/JEDEC standard J-ST-020A.

**APPLICATION INFORMATION**

**Input Stage**

The NCS2250 and NCS2252 have rail-to-rail inputs. The input common mode voltage range of these comparators extend 200 mV beyond the rails, allowing voltage sensing at ground or at the supply voltage.

**Output Stage**

The NCS2250 has a complementary, push-pull output stage. When the output transitions between high and low states, a low resistance path is created between the positive and negative supply rails, temporarily increasing the supply current during the transition.

The NCS2252 has an open-drain output stage. This allows the output to be connected through a pull-up resistor to another supply voltage for applications where level translation or level shifting is needed. The output resistor can be connected to voltages below  $V_{DD}$  or up to  $V_{DD} + 0.3$  V. Since the NCS2252 relies on an external pull-up resistor

to provide sourcing current, the timing of the output low-to-high transition is determined by the RC time constant of the pull-up resistor and the load capacitance.

**Hysteresis**

When the inputs are near the same voltage, slight voltage fluctuations due to noise can cause the output to oscillate between high and low states. If noise-induced switching behavior is observed at the output, hysteresis should be added through an external resistor network. This is particularly the case for NCS2250, as sustained output oscillations causing increased supply current will result in elevated junction temperature.

Hysteresis can be added to the circuit by adding one or two external resistors depending on whether an inverting or non-inverting configuration is needed. Figure 17 shows the inverting configuration. In this configuration, the output voltage adjusts the threshold at the IN+ pin.

**Figure 17. Comparator with Hysteresis, Inverting Configuration**

For the inverting configuration, the value of the high-level input voltage which triggers the output to switch from high to low is given by the following equation:

$$V_{IN\_high} = \frac{R_1 \times R_F}{R_1 \times R_F + R_1 \times R_2 + R_2 \times R_F} \times V_{DD} \quad (\text{eq. 1})$$

The value of the low-level input voltage which triggers the output to switch from low to high is given by the following equation:

$$V_{IN\_low} = \frac{R_1 \times R_F + R_1 \times R_2}{R_1 \times R_F + R_1 \times R_2 + R_2 \times R_F} \times V_{DD} \quad (\text{eq. 2})$$

Figure 18 shows the non-inverting configuration. For the non-inverting configuration, the threshold  $V_{th}$  set by  $R_1$  and  $R_2$  is fixed. The output adjusts the input signal on IN+.

**Figure 18. Comparator with Hysteresis, Non-Inverting Configuration**

The value of the high-level input voltage which triggers the output to switch from low to high is given by the following equation:

$$V_{IN\_high} = \frac{V_{th} \times (R_{IN} + R_F)}{R_F} \quad (\text{eq. 3})$$

The value of the low-level input voltage which triggers the output to switch from high to low is given by the following equation:

$$V_{IN\_low} = \frac{V_{th} \times (R_{IN} + R_F) - R_{IN} \times V_{DD}}{R_F} \quad (\text{eq. 4})$$

**Power dissipation**

The absolute maximum junction temperature is 150°C. The junction temperature can be calculated using the power dissipation  $P$ , thermal resistance  $\theta_{JA}$ , and ambient temperature  $T_A$ .

$$T_J = \theta_{JA} \times P + T_A \quad (\text{eq. 5})$$

**Layout Techniques**

High speed layout techniques are recommended for the best performance.

Bypass capacitors of at least 0.1  $\mu\text{F}$  must be placed as close as possible to supply pins.

The traces on the input pins should be short to minimize any noise on the high impedance inputs. In general, shorter traces will reduce parasitic capacitance, inductance, and resistance.

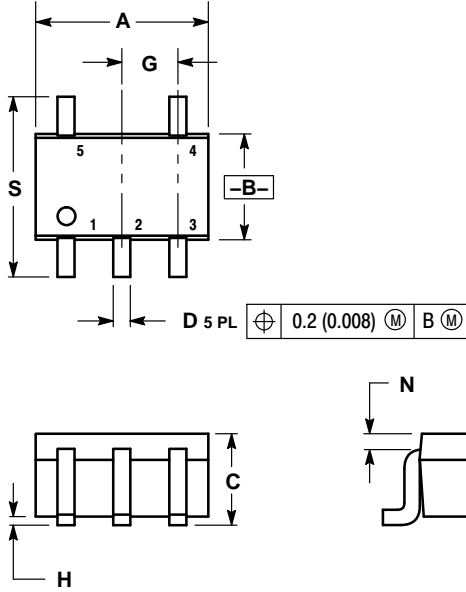

Identify and keep sensitive traces away from possible noise sources such as clocks. Crosstalk can be reduced by increasing the distance between traces. Do not let traces run parallel for long distances. Take advantage of routing layers to separate traces that would otherwise run parallel. Ground or DC voltage supplies can be used to separate a sensitive trace from a noise source.

Avoid floating nodes as these will pick up noise.
