

iNEMO inertial module: always-on 3D accelerometer and 3D gyroscope

LGA-14L
(2.5 x 3.0 x 0.83 mm) typ.

Features

- Power consumption: 0.55 mA in combo high-performance mode
- “Always-on” experience with low power consumption for both accelerometer and gyroscope
- Smart FIFO up to 9 kbyte
- Android compliant
- $\pm 2/\pm 4/\pm 8/\pm 16$ g full scale
- $\pm 125/\pm 250/\pm 500/\pm 1000/\pm 2000$ dps full scale
- Analog supply voltage: 1.71 V to 3.6 V
- Independent IO supply (1.62 V)
- Compact footprint: 2.5 mm x 3 mm x 0.83 mm
- SPI / I²C & MIPI I3CSM serial interface with main processor data synchronization
- Auxiliary SPI for OIS data output for gyroscope and accelerometer
- OIS configurable from Aux SPI, primary interface (SPI / I²C & MIPI I3CSM)
- Advanced pedometer, step detector and step counter
- Significant Motion Detection, Tilt detection
- Standard interrupts: free-fall, wakeup, 6D/4D orientation, click and double-click
- Programmable finite state machine: accelerometer, gyroscope and external sensors
- Machine Learning Core
- S4S data synchronization
- Embedded temperature sensor
- ECOPACK[®], RoHS and “Green” compliant

Applications

- Motion tracking and gesture detection
- Sensor hub
- Indoor navigation
- IoT and connected devices
- Smart power saving for handheld devices
- EIS and OIS for camera applications
- Vibration monitoring and compensation

Description

The LSM6DSOX is a system-in-package featuring a 3D digital accelerometer and a 3D digital gyroscope boosting performance at 0.55 mA in high-performance mode and enabling always-on low-power features for an optimal motion experience for the consumer.

The LSM6DSOX supports main OS requirements, offering real, virtual and batch sensors with 9 kbytes for dynamic data batching. ST’s family of MEMS sensor modules leverages the robust and mature manufacturing processes already used for the production of micromachined accelerometers and gyroscopes. The various sensing elements are manufactured using specialized micromachining processes,

while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit which is trimmed to better match the characteristics of the sensing element.

The LSM6DSOX has a full-scale acceleration range of $\pm 2/\pm 4/\pm 8/\pm 16$ g and an angular rate range of $\pm 125/\pm 250/\pm 500/\pm 1000/\pm 2000$ dps.

The LSM6DSOX fully supports EIS and OIS applications as the module includes a dedicated configurable signal processing path for OIS and auxiliary SPI, configurable for both the gyroscope and accelerometer. The LSM6DSOX OIS can be configured from the Auxiliary SPI and primary interface (SPI / I²C & MIPI I3CSM).

High robustness to mechanical shock makes the LSM6DSOX the preferred choice of system designers for the creation and manufacturing of reliable products. The LSM6DSOX is available in a plastic land grid array (LGA) package.

1 Overview

The LSM6DSOX is a system-in-package featuring a high-performance 3-axis digital accelerometer and 3-axis digital gyroscope.

The LSM6DSOX delivers best-in-class motion sensing that can detect orientation and gestures in order to empower application developers and consumers with features and capabilities that are more sophisticated than simply orienting their devices to portrait and landscape mode.

The event-detection interrupts enable efficient and reliable motion tracking and contextual awareness, implementing hardware recognition of free-fall events, 6D orientation, click and double-click sensing, activity or inactivity, stationary/motion detection and wakeup events.

The LSM6DSOX supports main OS requirements, offering real, virtual and batch mode sensors. In addition, the LSM6DSOX can efficiently run the sensor-related features specified in Android, saving power and enabling faster reaction time. In particular, the LSM6DSOX has been designed to implement hardware features such as significant motion detection, stationary/motion detection, tilt, pedometer functions, timestamping and to support the data acquisition of an external magnetometer.

The LSM6DSOX offers hardware flexibility to connect the pins with different mode connections to external sensors to expand functionalities such as adding a sensor hub, auxiliary SPI, etc.

Up to 9 kbytes of FIFO with compression and dynamic allocation of significant data (i.e. external sensors, timestamp, etc.) allows overall power saving of the system.

Like the entire portfolio of MEMS sensor modules, the LSM6DSOX leverages the robust and mature in-house manufacturing processes already used for the production of micromachined accelerometers and gyroscopes. The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit which is trimmed to better match the characteristics of the sensing element.

The LSM6DSOX is available in a small plastic land grid array (LGA) package of 2.5 x 3.0 x 0.83 mm to address ultra-compact solutions.

2 Embedded low-power features

The LSM6DSOX has been designed to be fully compliant with Android, featuring the following on-chip functions:

- 9 kbytes data buffering, data can be compressed two or three times
 - 100% efficiency with flexible configurations and partitioning
 - Possibility to store timestamp
- Event-detection interrupts (fully configurable)
 - Free-fall
 - Wakeup
 - 6D orientation
 - Click and double-click sensing
 - Activity/Inactivity recognition
 - Stationary/Motion detection
- Specific IP blocks with negligible power consumption and high-performance
 - Pedometer functions: step detector and step counters
 - Tilt
 - Significant Motion Detection
 - Finite State Machine (FSM) for accelerometer, gyroscope, and external sensors
 - Machine Learning Core (MLC)
- Sensor hub
 - Up to 6 total sensors: 2 internal (accelerometer and gyroscope) and 4 external sensors
- S4S data rate synchronization with external trigger for reduced sensor access and enhanced fusion

2.1 Tilt detection

The tilt function helps to detect activity change and has been implemented in hardware using only the accelerometer to achieve targets of both ultra-low power consumption and robustness during the short duration of dynamic accelerations.

The tilt function is based on a trigger of an event each time the device's tilt changes and can be used with different scenarios, for example:

- Triggers when phone is in a front pants pocket and the user goes from sitting to standing or standing to sitting;
- Doesn't trigger when phone is in a front pants pocket and the user is walking, running or going upstairs.

2.2 Significant Motion Detection

The Significant Motion Detection (SMD) function generates an interrupt when a 'significant motion', that could be due to a change in user location, is detected. In the LSM6DSOX device this function has been implemented in hardware using only the accelerometer.

SMD functionality can be used in location-based applications in order to receive a notification indicating when the user is changing location.

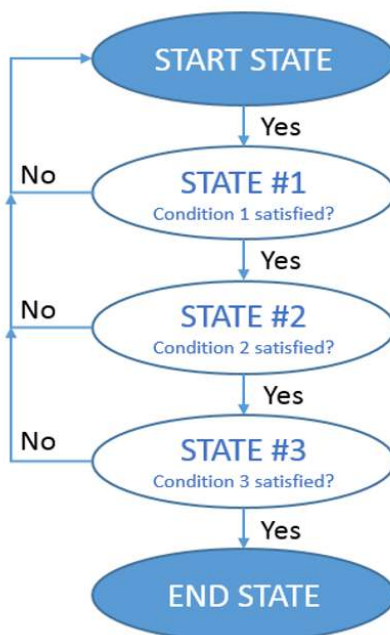

2.3 Finite State Machine

The LSM6DSOX can be configured to generate interrupt signals activated by user-defined motion patterns. To do this, up to 16 embedded finite state machines can be programmed independently for motion detection such as glance gestures, absolute wrist tilt, shake and double-shake detection.

Definition of Finite State Machine

A state machine is a mathematical abstraction used to design logic connections. It is a behavioral model composed of a finite number of states and transitions between states, similar to a flow chart in which one can inspect the way logic runs when certain conditions are met. The state machine begins with a start state, goes to different states through transitions dependent on the inputs, and can finally end in a specific state (called stop state). The current state is determined by the past states of the system. The following figure shows a generic state machine.

Figure 1. Generic state machine

Finite State Machine in the LSM6DSOX

The LSM6DSOX works as a combo accelerometer-gyroscope sensor, generating acceleration and angular rate output data. It is also possible to connect an external sensor (magnetometer) by using the Sensor Hub feature (Mode 2). These data can be used as input of up to 16 programs in the embedded Finite State Machine (Figure 2. State machine in the LSM6DSOX).

All 16 finite state machines are independent: each one has its dedicated memory area and it is independently executed. An interrupt is generated when the end state is reached or when some specific command is performed.

Figure 2. State machine in the LSM6DSOX

2.4 Machine Learning Core

The LSM6DSOX embeds a dedicated core for machine learning processing that provides system flexibility, allowing some algorithms run in the application processor to be moved to the MEMS sensor with the advantage of consistent reduction in power consumption.

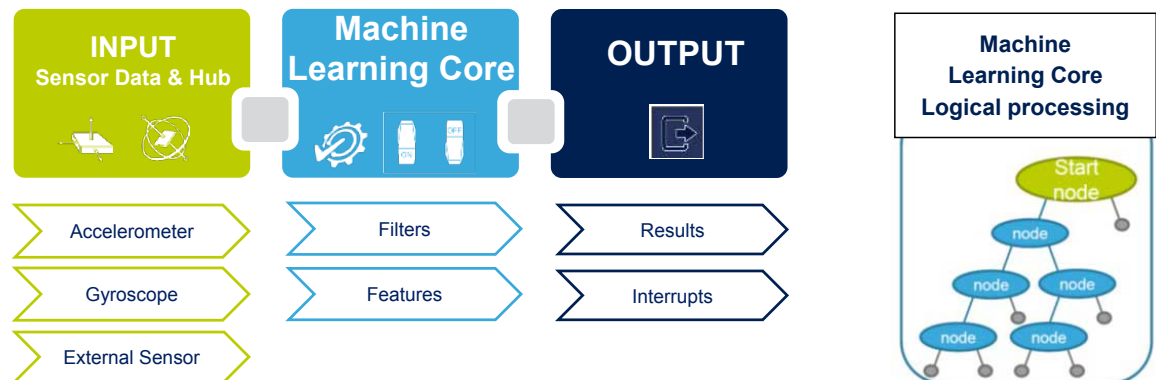

Machine Learning Core logic allows identifying if a data pattern (for example motion, pressure, temperature, magnetic data, etc.) matches a user-defined set of classes. Typical examples of applications could be activity detection like running, walking, driving, etc.

The LSM6DSOX Machine Learning Core works on data patterns coming from the accelerometer and gyro sensors, but it is also possible to connect and process external sensor data (like magnetometer) by using the Sensor Hub feature (Mode 2).

The input data can be filtered using a dedicated configurable computation block containing filters and features computed in a fixed time window defined by the user.

Machine learning processing is based on logical processing composed of a series of configurable nodes characterized by "if-then-else" conditions where the "feature" values are evaluated against defined thresholds.

Figure 3. Machine Learning Core in the LSM6DSOX

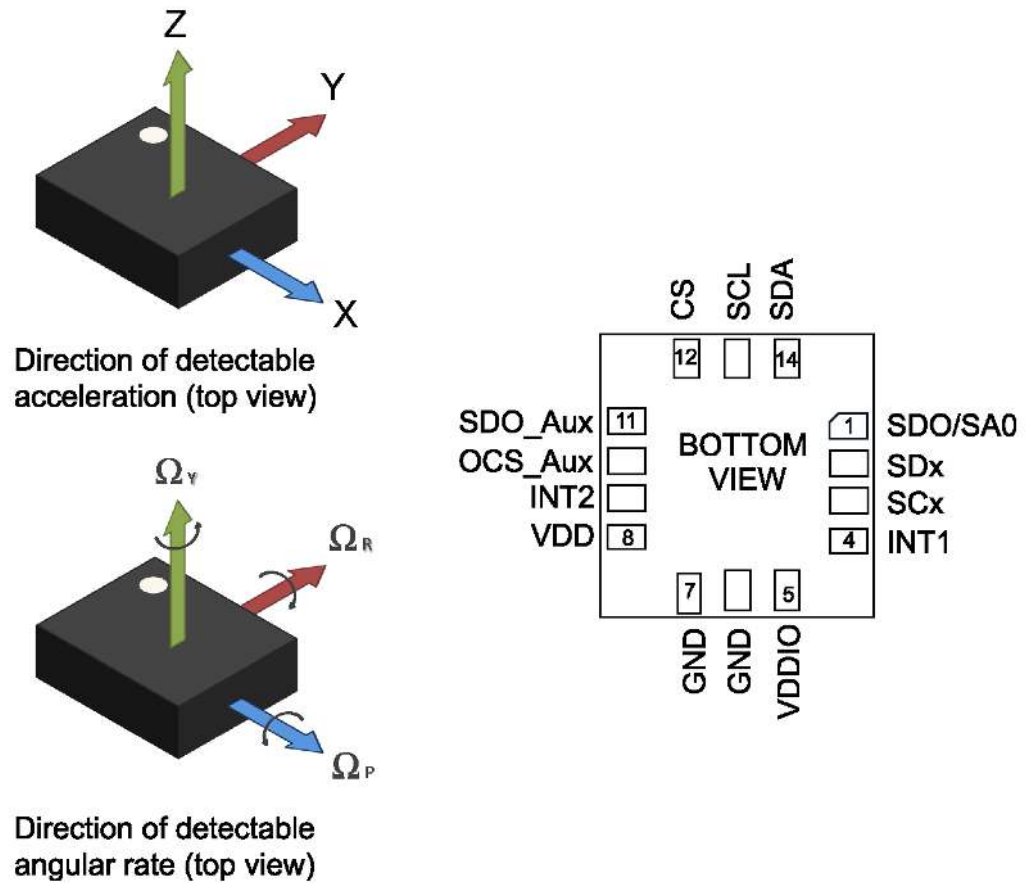

The LSM6DSOX can be configured to run up to 8 flows simultaneously and independently and every flow can generate up to 16 results. The total number of nodes can be up to 256.

The results of the machine learning processing are available in dedicated output registers readable from the application processor at any time.

The LSM6DSOX Machine Learning Core can be configured to generate an interrupt when a change in the result occurs.

Figure 4. Pin connections

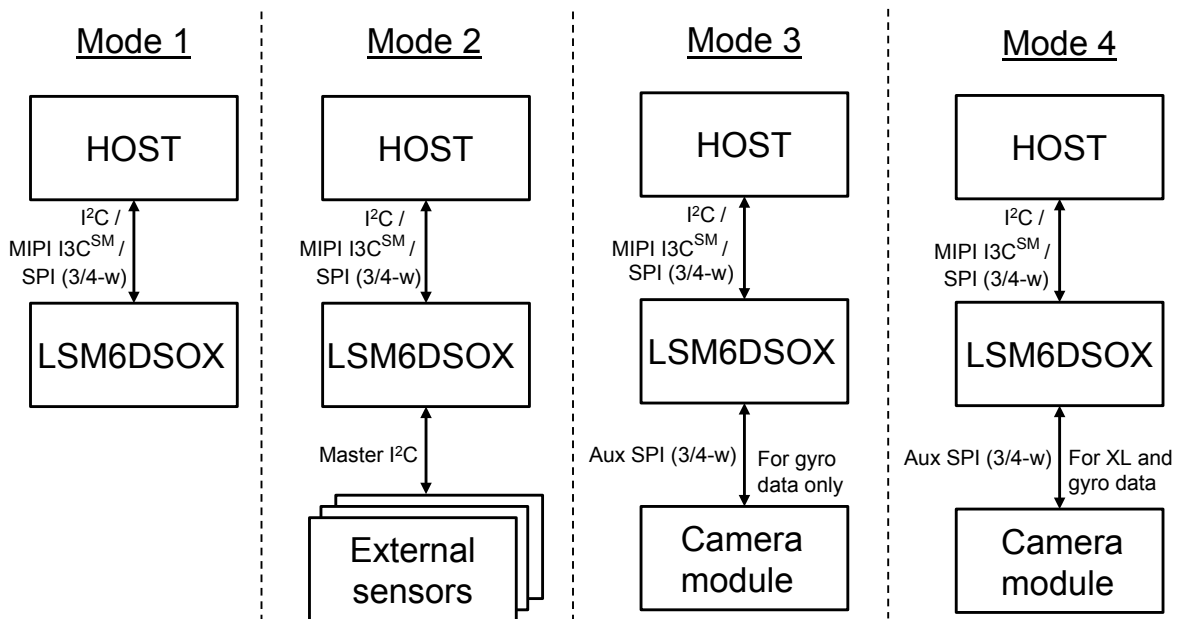

3.1 Pin connections

The LSM6DSOX offers flexibility to connect the pins in order to have four different mode connections and functionalities. In detail:

- **Mode 1:** I²C / MIPI I3CSM slave interface or SPI (3- and 4-wire) serial interface is available;
- **Mode 2:** I²C / MIPI I3CSM slave interface or SPI (3- and 4-wire) serial interface and I²C interface master for external sensor connections are available;
- **Mode 3:** I²C / MIPI I3CSM slave interface or SPI (3- and 4-wire) serial interface is available for the application processor interface while an auxiliary SPI (3- and 4-wire) serial interface for external sensor connections is available for the gyroscope ONLY;
- **Mode 4:** I²C / MIPI I3CSM slave interface or SPI (3- and 4-wire) serial interface is available for the application processor interface while an auxiliary SPI (3- and 4-wire) serial interface for external sensor connections is available for the accelerometer and gyroscope.

4.5 Absolute maximum ratings

Stresses above those listed as “Absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 7. Absolute maximum ratings

Symbol	Ratings	Maximum value	Unit
Vdd	Supply voltage	-0.3 to 4.8	V
T _{STG}	Storage temperature range	-40 to +125	°C
Sg	Acceleration <i>g</i> for 0.2 ms	20,000	<i>g</i>
ESD	Electrostatic discharge protection (HBM)	2	kV
V _{in}	Input voltage on any control pin (including CS, SCL/SPC, SDA/SDI/SDO, SDO/SA0)	-0.3 to Vdd_IO +0.3	V

Note: Supply voltage on any pin should never exceed 4.8 V.

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

4.6 Terminology

4.6.1 Sensitivity

Linear acceleration sensitivity can be determined, for example, by applying 1 g acceleration to the device. Because the sensor can measure DC accelerations, this can be done easily by pointing the selected axis towards the ground, noting the output value, rotating the sensor 180 degrees (pointing towards the sky) and noting the output value again. By doing so, ± 1 g acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and over time. The sensitivity tolerance describes the range of sensitivities of a large number of sensors (see [Table 2](#)).

An angular rate gyroscope is a device that produces a positive-going digital output for counterclockwise rotation around the axis considered. Sensitivity describes the gain of the sensor and can be determined by applying a defined angular velocity to it. This value changes very little over temperature and time (see [Table 2](#)).

4.6.2 Zero-g and zero-rate level

Linear acceleration zero-g level offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady state on a horizontal surface will measure 0 g on both the X-axis and Y-axis, whereas the Z-axis will measure 1 g. Ideally, the output is in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as 2's complement number). A deviation from the ideal value in this case is called zero-g offset.

Offset is to some extent a result of stress to MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Linear acceleration zero-g level change vs. temperature" in [Table 2](#). The zero-g level tolerance (TyOff) describes the standard deviation of the range of zero-g levels of a group of sensors.

Zero-rate level describes the actual output signal if there is no angular rate present. The zero-rate level of precise MEMS sensors is, to some extent, a result of stress to the sensor and therefore the zero-rate level can slightly change after mounting the sensor onto a printed circuit board or after exposing it to extensive mechanical stress. This value changes very little over temperature and time (see [Table 2](#)).

5 Digital interfaces

5.1 I²C/SPI interface

The registers embedded inside the LSM6DSOX may be accessed through both the I²C and SPI serial interfaces. The latter may be SW configured to operate either in 3-wire or 4-wire interface mode. The device is compatible with SPI modes 0 and 3.

The serial interfaces are mapped onto the same pins. To select/exploit the I²C interface, the CS line must be tied high (i.e connected to Vdd_IO).

Table 8. Serial interface pin description

Pin name	Pin description
CS	SPI enable I ² C/SPI mode selection (1: SPI idle mode / I ² C communication enabled; 0: SPI communication mode / I ² C disabled)
SCL/SPC	I ² C Serial Clock (SCL) SPI Serial Port Clock (SPC)
SDA/SDI/SDO	I ² C Serial Data (SDA) SPI Serial Data Input (SDI) 3-wire Interface Serial Data Output (SDO)
SDO/SA0	SPI Serial Data Output (SDO) I ² C less significant bit of the device address

5.1.1 I²C serial interface

The LSM6DSOX I²C is a bus slave. The I²C is employed to write the data to the registers, whose content can also be read back.

The relevant I²C terminology is provided in the table below.

Table 9. I²C terminology

Term	Description
Transmitter	The device which sends data to the bus
Receiver	The device which receives data from the bus
Master	The device which initiates a transfer, generates clock signals and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I²C bus: the serial clock line (SCL) and the Serial DATA line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface. Both the lines must be connected to Vdd_IO through external pull-up resistors. When the bus is free, both the lines are high.

The I²C interface is implemented with fast mode (400 kHz) I²C standards as well as with the standard mode.

In order to disable the I²C block, (I2C_disable) = 1 must be written in CTRL4_C (13h).

5.1.2 I²C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a HIGH to LOW transition on the data line while the SCL line is held HIGH. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the master.

The Slave ADDRESS (SAD) associated to the LSM6DSOX is 110101xb. The SDO/SA0 pin can be used to modify the less significant bit of the device address. If the SDO/SA0 pin is connected to the supply voltage, LSb is '1' (address 1101011b); else if the SDO/SA0 pin is connected to ground, the LSb value is '0' (address 1101010b). This solution permits to connect and address two different inertial modules to the same I²C bus.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line LOW so that it remains stable low during the HIGH period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded inside the LSM6DSOX behaves like a slave device and the following protocol must be adhered to. After the start condition (ST) a slave address is sent, once a slave acknowledge (SAK) has been returned, an 8-bit sub-address (SUB) is transmitted. The increment of the address is configured by the CTRL3_C (12h) (IF_INC).

The slave address is completed with a Read/Write bit. If the bit is '1' (Read), a repeated START (SR) condition must be issued after the two sub-address bytes; if the bit is '0' (Write) the master will transmit to the slave with direction unchanged. Table 10 explains how the SAD+Read/Write bit pattern is composed, listing all the possible configurations.

Table 10. SAD+Read/Write patterns

Command	SAD[6:1]	SAD[0] = SA0	R/W	SAD+R/W

Table 14. Transfer when master is receiving (reading) multiple bytes of data from slave

Master	ST	SAD+W		SUB		SR	SAD+R			MAK		MAK		NMAK	SP
Slave			SAK		SAK			SAK	DATA		DATA		DATA		

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the Most Significant bit (MSb) first. If a receiver can't receive another complete byte of data until it has performed some other function, it can hold the clock line, SCL LOW to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver doesn't acknowledge the slave address (i.e. it is not able to receive because it is performing some real-time function) the data line must be left HIGH by the slave. The master can then abort the transfer. A LOW to HIGH transition on the SDA line while the SCL line is HIGH is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

In the presented communication format MAK is Master acknowledge and NMAK is No Master Acknowledge.

5.1.3 SPI bus interface

The LSM6DSOX SPI is a bus slave. The SPI allows writing and reading the registers of the device.

The serial interface communicates to the application using 4 wires: **CS**, **SPC**, **SDI** and **SDO**.

Figure 8. Read and write protocol (in mode 3)

CS is the serial port enable and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end. **SPC** is the serial port clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are, respectively, the serial port data input and output. Those lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

bit 0: \overline{RW} bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In latter case, the chip will drive **SDO** at the start of bit 8.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written into the device (MSb first).

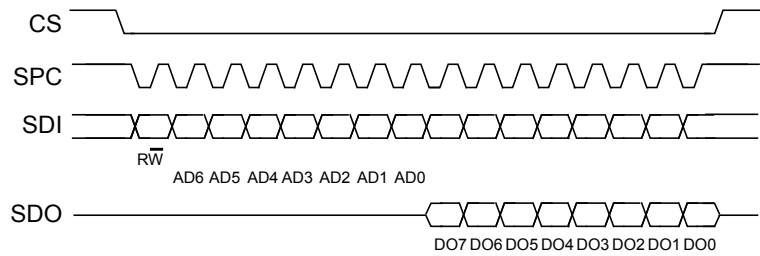

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

In multiple read/write commands further blocks of 8 clock periods will be added. When the **CTRL3_C** (12h) (IF_INC) bit is '0', the address used to read/write data remains the same for every block. When the **CTRL3_C** (12h) (IF_INC) bit is '1', the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

5.1.3.1 SPI read

Figure 9. SPI read protocol (in mode 3)

The SPI Read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

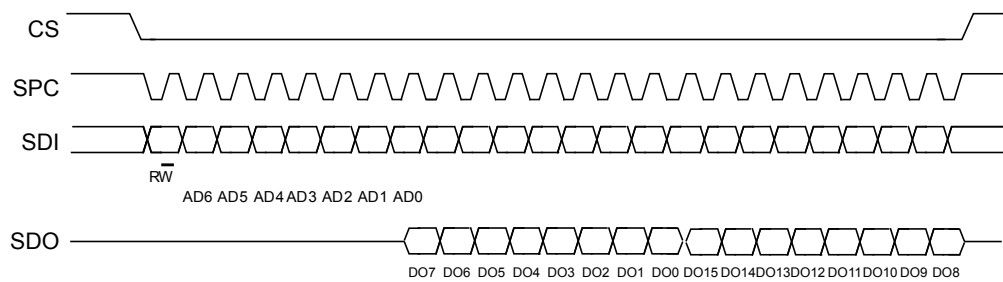

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that will be read from the device (MSb first).

bit 16-...: data DO(...-8). Further data in multiple byte reads.

Figure 10. Multiple byte SPI read protocol (2-byte example) (in mode 3)

5.1.3.2 SPI write
Figure 11. SPI write protocol (in mode 3)

The SPI Write command is performed with 16 clock pulses. A multiple byte write command is performed by adding blocks of 8 clock pulses to the previous one.

bit 0: WRITE bit. The value is 0.

bit 1 -7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written inside the device (MSb first).

bit 16-... : data DI(...-8). Further data in multiple byte writes.

Figure 12. Multiple byte SPI write protocol (2-byte example) (in mode 3)

5.1.3.3 SPI read in 3-wire mode

A 3-wire mode is entered by setting the CTRL3_C (12h) (SIM) bit equal to '1' (SPI serial interface mode selection).

Figure 13. SPI read protocol in 3-wire mode (in mode 3)

The SPI read command is performed with 16 clock pulses:

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

A multiple read command is also available in 3-wire mode.

5.2 MIPI I3CSM interface

5.2.1 MIPI I3CSM slave interface

The LSM6DSOX interface includes an MIPI I3CSMSDR only slave interface (compliant with release 1.0 of the specification) with MIPI I3CSM SDR embedded features:

- CCC command
- Direct CCC communication (SET and GET)
- Broadcast CCC communication
- Private communications
- Private read and write for single byte
- Multiple read and write
- In-Band Interrupt request

Error Detection and Recovery Methods (S0-S6)

Refer to [Section 5.3 I²C/I3C coexistence in LSM6DSOX](#) for details concerning the choice of the interface when powering up the device.

5.2.2 MIPI I3CSM CCC supported commands

The list of MIPI I3CSM CCC commands supported by the device is detailed in the following table.

Table 15. MIPI I3CSM CCC commands

Command	Command code	Default	Description
ENTDAA	0x07		DAA procedure
SETDASA	0x87		Assign Dynamic Address using Static Address 0x6B/0x6A depending on SDO pin
ENEC	0x80 / 0x00		Slave activity control (direct and broadcast)
DISEC	0x81/ 0x01		Slave activity control (direct and broadcast)
ENTAS0	0x82 / 0x02		Enter activity state (direct and broadcast)
ENTAS1	0x83 / 0x03		Enter activity state (direct and broadcast)
ENTAS2	0x84 / 0x04		Enter activity state (direct and broadcast)
ENTAS3	0x85 / 0x05		Enter activity state (direct and broadcast)
SETXTIME	0x98 / 0x28		Timing information exchange
GETXTIME	0x99	0x07 0x00 0x05 0x92	Timing information exchange
RSTDAA	0x86 / 0x06		Reset the assigned dynamic address (direct and broadcast)
SETMWL	0x89 / 0x08		Define maximum write length during private write (direct and broadcast)
SETMRL	0x8A / 0x09		Define maximum read length during private read (direct and broadcast)
SETNEWDA	0x88		Change dynamic address
GETMWL	0x8B	0x00 0x08 (2 byte)	Get maximum write length during private write

Command	Command code	Default	Description
GETMRL	0x8C	0x00 0x10 0x09 (3 byte)	Get maximum read length during private read
GETPID	0x8D	0x02 0x08 0x00 0x6C 0x10 0x0B	Device ID register
GETBCR	0x8E	0x07 (1 byte)	Bus characteristics register
GETDCR	0x8F	0x44 default	MIPI I3C SM Device Characteristic Register
GETSTATUS	0x90	0x00 0x00 (2 byte)	Status register
GETMXDS	0x94	0x00 0x20 (2 byte)	Return max data speed

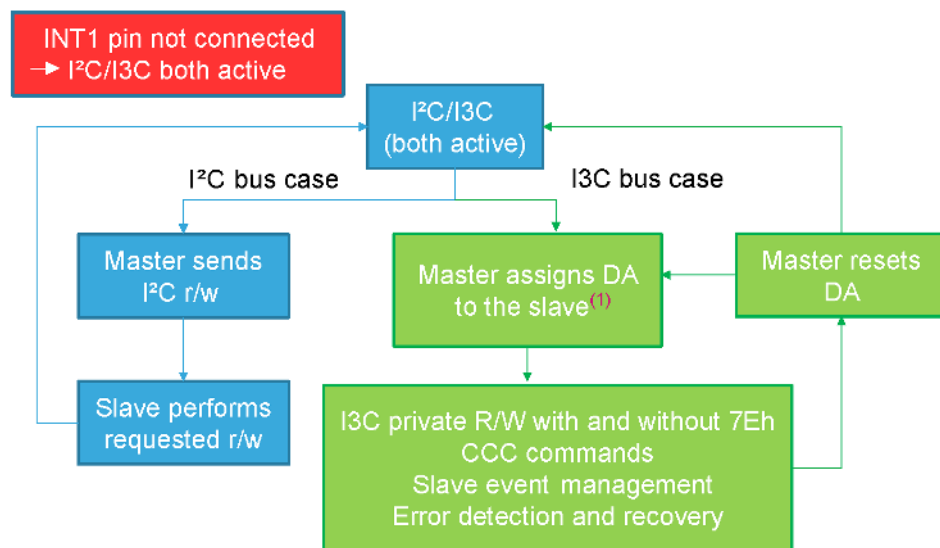

5.3 I²C/I³C coexistence in LSM6DSOX

In the LSM6DSOX, the SDA and SCL lines are common to both I²C and I³C. The I²C bus requires anti-spike filters on the SDA and SCL pins that are not compatible with I³C timing.

The device can be connected to both I²C and I³C or only to the I³C bus depending on the connection of the INT1 pin when the device is powered up:

- INT1 pin floating (internal pull-down): I²C/I³C both active, see Figure 14
- INT1 pin connected to VDD_IO: only I³C active, see Figure 15

Figure 14. I²C and I³C both active (INT1 pin not connected)

1. Address assignment (DAA or ENTDA) must be performed with I²C Fast Mode Plus Timing. When the slave is addressed, the I²C slave is disabled and the timing is compatible with I³C specifications.

Figure 15. Only I³C active (INT1 pin connected to VDD_IO)

1. When the slave is I³C only, the I²C slave is always disabled. The address can be assigned using I³C SDR timing.

5.4 Master I²C interface

If the LSM6DSOX is configured in Mode 2, a master I²C line is available. The master serial interface is mapped in the following dedicated pins.

Table 16. Master I²C pin details

Pin name	Pin description
MSCL	I ² C serial clock master
MSDA	I ² C serial data master
MDRDY	I ² C master external synchronization signal

5.5 Auxiliary SPI interface

If the LSM6DSOX is configured in Mode 3 or Mode 4, the auxiliary SPI is available. The auxiliary SPI interface is mapped to the following dedicated pins.

Table 17. Auxiliary SPI pin details

Pin name	Pin description
OCS_Aux	Auxiliary SPI 3/4-wire enable
SDx	Auxiliary SPI 3/4-wire data input (SDI_Aux) and SPI 3-wire data output (SDO_Aux)
SCx	Auxiliary SPI 3/4-wire interface serial port clock
SDO_Aux	Auxiliary SPI 4-wire data output (SDO_Aux)

When the LSM6DSOX is configured in Mode 3 or Mode 4, the auxiliary SPI can be connected to a camera module for OIS/EIS support.

6 Functionality

6.1 Operating modes

In the LSM6DSOX, the accelerometer and the gyroscope can be turned on/off independently of each other and are allowed to have different ODRs and power modes.

The LSM6DSOX has three operating modes available:

- only accelerometer active and gyroscope in power-down
- only gyroscope active and accelerometer in power-down
- both accelerometer and gyroscope sensors active with independent ODR

The accelerometer is activated from power-down by writing ODR_XL[3:0] in [CTRL1_XL \(10h\)](#) while the gyroscope is activated from power-down by writing ODR_G[3:0] in [CTRL2_G \(11h\)](#). For combo-mode the ODRs are totally independent.

6.2 Accelerometer power modes

In the LSM6DSOX, the accelerometer can be configured in five different operating modes: power-down, ultra-low-power, low-power, normal mode and high-performance mode. The operating mode selected depends on the value of the XL_HM_MODE bit in [CTRL6_C \(15h\)](#). If XL_HM_MODE is set to '0', high-performance mode is valid for all ODRs (from 12.5 Hz up to 6.66 kHz).

To enable the low-power and normal mode, the XL_HM_MODE bit has to be set to '1'. Low-power mode is available for lower ODRs (1.6, 12.5, 26, 52 Hz) while normal mode is available for ODRs equal to 104 and 208 Hz.

6.2.1 Accelerometer ultra-low-power mode

The LSM6DSOX can be configured in ultra-low-power (ULP) mode by setting the XL_ULP_EN bit to 1 in [CTRL5_C \(14h\)](#) register. This mode can be used in accelerometer-only mode (gyroscope sensor must be configured in power-down mode) and for ODR_XL values between 1.6 Hz and 208 Hz.

When ULP mode is intended to be used, the bit XL_HM_MODE must be set to 0.

When ULP mode is switched ON/OFF, the accelerometer must be configured in power-down condition.

ULP mode cannot be used in Mode 3 or Mode 4 connection modes.

The embedded functions based on accelerometer data (free-fall, 6D/4D, tap, double tap, wake-up, activity/inactivity, stationary/motion, step counter, step detection, significant motion, tilt) and the FIFO batching functionality are still supported when ULP mode is enabled.

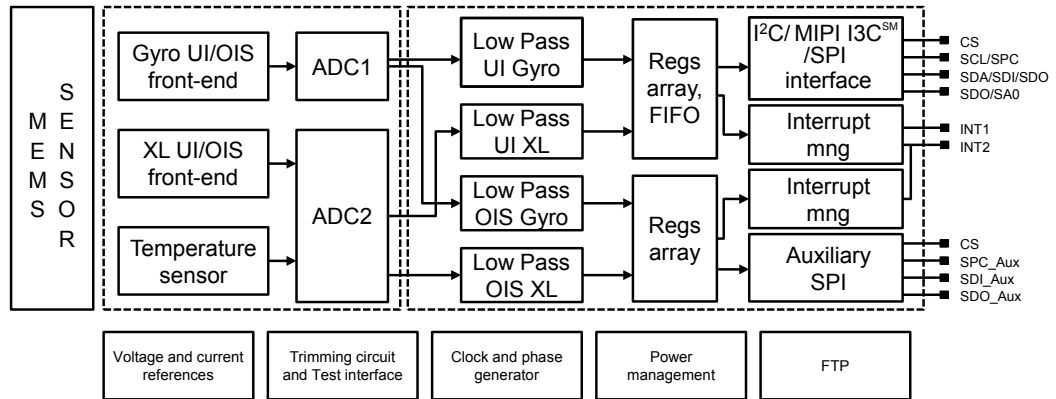

6.3 Gyroscope power modes

In the LSM6DSOX, the gyroscope can be configured in four different operating modes: power-down, low-power, normal mode and high-performance mode. The operating mode selected depends on the value of the G_HM_MODE bit in [CTRL7_G \(16h\)](#). If G_HM_MODE is set to '0', high-performance mode is valid for all ODRs (from 12.5 Hz up to 6.66 kHz).

To enable the low-power and normal mode, the G_HM_MODE bit has to be set to '1'. Low-power mode is available for lower ODRs (12.5, 26, 52 Hz) while normal mode is available for ODRs equal to 104 and 208 Hz.

6.4 Block diagram of filters

Figure 16. Block diagram of filters

6.4.1 Block diagrams of the accelerometer filters

In the LSM6DSOX, the filtering chain for the accelerometer part is composed of the following:

- Analog filter (anti-aliasing)
- Digital filter (LPF1)
- Composite filter

Details of the block diagram appear in the following figure.

Figure 17. Accelerometer UI chain

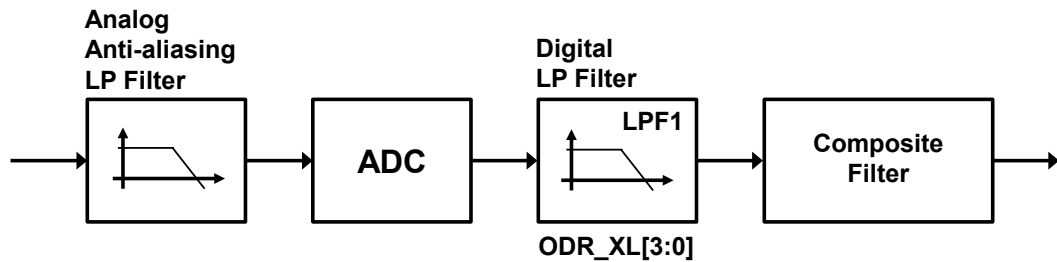

Figure 18. Accelerometer composite filter

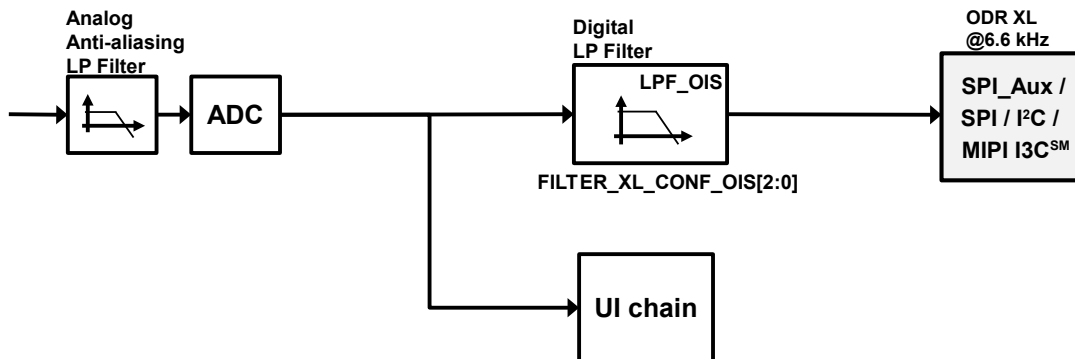

1. The cutoff value of the LPF1 output is $ODR/2$ when the accelerometer is in high-performance mode. This value is equal to 700 Hz when the accelerometer is in low-power or normal mode.

Note: Advanced functions include pedometer, step detector and step counter, significant motion detection, and tilt functions.

The accelerometer filtering chain when Mode 4 is enabled is illustrated in the following figure.

Figure 19. Accelerometer chain with Mode 4 enabled

Note: Mode 4 is enabled when `Mode4_EN = 1` and `OIS_EN_SPI2 = 1` in `UI_CTRL1_OIS (70h)` / `SPI2_CTRL1_OIS (70h)`.

The configuration of the accelerometer UI chain is not affected by enabling Mode 4.

Accelerometer output values are available in the following registers with ODR at 6.66 kHz:

- `UI_OUTX_L_A_OIS (50h)` and `UI_OUTX_H_A_OIS (51h)` through `UI_OUTZ_L_A_OIS (54h)` and `UI_OUTZ_H_A_OIS (55h)`
- `SPI2_OUTX_L_A_OIS (28h)` and `SPI2_OUTX_H_A_OIS (29h)` through `SPI2_OUTZ_L_A_OIS (2Ch)` and `SPI2_OUTZ_H_A_OIS (2Dh)`

Accelerometer full-scale management between the UI chain and OIS chain depends on the setting of the `XL_FS_MODE` bit in register `CTRL8_XL (17h)`.

6.4.2 Block diagrams of the gyroscope filters

In the LSM6DSOX, the gyroscope filtering chain depends on the mode configuration:

- Mode 1 (for User Interface (UI) and Electronic Image Stabilization (EIS) functionality through primary interface) and Mode 2

Figure 20. Gyroscope digital chain - Mode 1 (UI/EIS) and Mode 2

In this configuration, the gyroscope ODR is selectable from 12.5 Hz up to 6.66 kHz. A low-pass filter (LPF1) is available if the auxiliary SPI is disabled, for more details about the filter characteristics see [Table 67. Gyroscope LPF1 bandwidth selection](#).

The digital LPF2 filter cannot be configured by the user and its cutoff frequency depends on the selected gyroscope ODR, as indicated in the following table.

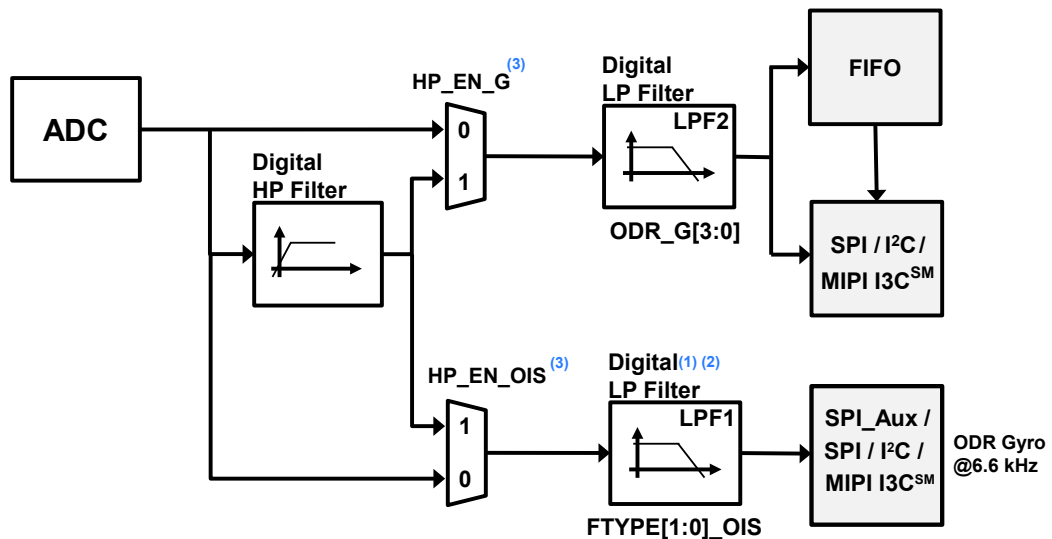

Table 18. Gyroscope LPF2 bandwidth selection

Gyroscope ODR [Hz]	LPF2 cutoff [Hz]
12.5	4.2
26	8.3
52	16.6
104	33.0
208	66.8
417	135.9
833	295.5
1667	1108.1
3333	1320.7
6667	1441.8

Note: Data can be acquired from the output registers and FIFO over the primary I²C/I³C/SPI interface.

- Mode 3 / Mode 4 (for OIS and EIS functionality)

Figure 21. Gyroscope digital chain - Mode 3 / Mode 4 (OIS/EIS)

1. When Mode 3/4 is enabled, the LPF1 filter is not available in the gyroscope UI chain.
2. It is recommended to avoid using the LPF1 filter in Mode1/2 when Mode3/4 is intended to be used.
3. HP_EN_OIS can be used to select the HPF on the OIS path only if the HPF is not used in the UI chain. If both the HP_EN_G bit and HP_EN_OIS bit are set to 1, the HP filter is applied to the UI chain only.

Note:

When S4S is enabled in the UI chain, the HPF is not available in the OIS chain.

The auxiliary interface needs to be enabled in [UI_CTRL1_OIS \(70h\)](#) / [SPI2_CTRL1_OIS \(70h\)](#).

In Mode 3/4 configuration, there are two paths:

- the chain for User Interface (UI) where the ODR is selectable from 12.5 Hz up to 6.66 kHz
- the chain for OIS/EIS where the ODR is at 6.66 kHz and the LPF1 is available. The LPF1 configuration depends on the setting of the FTYPE_[1:0]_OIS bit in register [UI_CTRL2_OIS \(71h\)](#) / [SPI2_CTRL2_OIS \(71h\)](#); for more details about the filter characteristics see [Table 182. Gyroscope OIS chain digital LPF1 filter bandwidth selection](#). Gyroscope output values are in registers 22h to 27h if read from the Aux_SPI or in registers 4Ah to 4Fh if read from the primary interface with the selected full scale (FS[1:0]_G_OIS bit in [UI_CTRL1_OIS \(70h\)](#) / [SPI2_CTRL1_OIS \(70h\)](#)).

6.5 OIS

This paragraph describes OIS functionality. There is a dedicated gyroscope and accelerometer DSP for OIS. Other features can be configured:

- Self-test on OIS side
- DEN on OIS side

6.5.1 Enabling OIS functionality and connection schemes

There are three different ways in order to enable and configure OIS functionality:

- **Auxiliary SPI full control:** Enabling and configuration done from Auxiliary SPI
- **Enabling primary interface:** Enable from primary interface, configuration from Auxiliary SPI
- **Primary interface full control:** Enabling and configuration done from primary interface

The configurations that allow selecting these three different options are done using the OIS_CTRL_FROM_UI bit in [FUNC_CFG_ACCESS \(01h\)](#) and the OIS_ON_EN bit in [CTRL7_G \(16h\)](#) as described in the following table.

Table 19. OIS configurations

OIS_CTRL_FROM_UI	OIS_ON_EN	OIS configuration option
0	0	Auxiliary SPI full control
0	1	Enabling primary interface
1	x	Primary interface full control

6.5.1.1 Auxiliary SPI full control

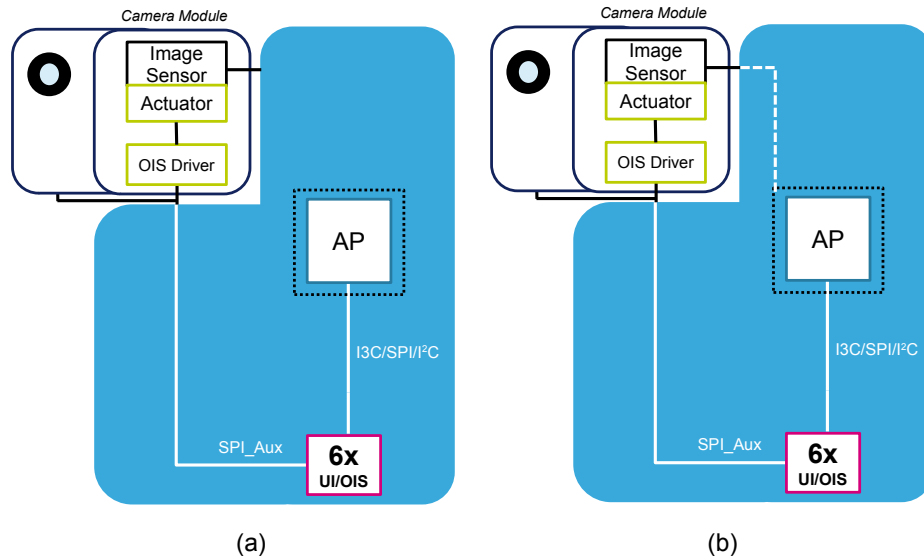

This is the default condition of the device. The camera module is completely independent from the application processor as shown in [Figure 22](#).

The Auxiliary SPI can configure OIS functionality through [SPI2_INT_OIS \(6Fh\)](#), [SPI2_CTRL1_OIS \(70h\)](#), [SPI2_CTRL2_OIS \(71h\)](#), [SPI2_CTRL3_OIS \(72h\)](#).

Reading from the Auxiliary SPI is enabled only when the OIS_EN_SPI2 bit in the [SPI2_CTRL1_OIS \(70h\)](#) register is set to '1'. This bit also turns on the gyroscope OIS chain.

The Primary Interface can access the OIS control registers ([UI_INT_OIS \(6Fh\)](#), [UI_CTRL1_OIS \(70h\)](#), [UI_CTRL2_OIS \(71h\)](#), [UI_CTRL3_OIS \(72h\)](#)) in read mode.

Note: If accelerometer Ultra-Low-Power Mode is intended to be used on the Primary chain, it is recommended to use the Primary IF enabling option instead, in order to make sure that the device is set in Power-Down (from ULP mode) before enabling the OIS chain.

Figure 22. Auxiliary SPI full control (a) and enabling primary interface (b)

6.5.1.2 Enabling primary interface

This option allows the application processor to enable/disable the OIS functionality from the primary interface. An example of this option is shown in Figure 22.

In order to enable/disable the OIS chain from the primary interface, the OIS_ON_EN bit in the CTRL7_G (16h) register must be set to '1' from the primary interface.

Then, enabling OIS functionalities and reading from the Auxiliary SPI can be done from the primary interface by setting the OIS_ON bit in CTRL7_G (16h) to '1'. This bit also turns on the gyroscope OIS chain.

The configuration of the OIS functionalities must be implemented from the Auxiliary SPI through the SPI2_INT_OIS (6Fh), SPI2_CTRL1_OIS (70h), SPI2_CTRL2_OIS (71h), and SPI2_CTRL3_OIS (72h) registers. The camera module can verify that the AP has enabled the LSM6DSOX OIS chain by reading the SPI2_WHO_AM_I (0Fh) register. The bit OIS_EN_SPI2 is kept under reset.

The Primary Interface can access the OIS control registers (UI_INT_OIS (6Fh), UI_CTRL1_OIS (70h), UI_CTRL2_OIS (71h), UI_CTRL3_OIS (72h)) in read mode.

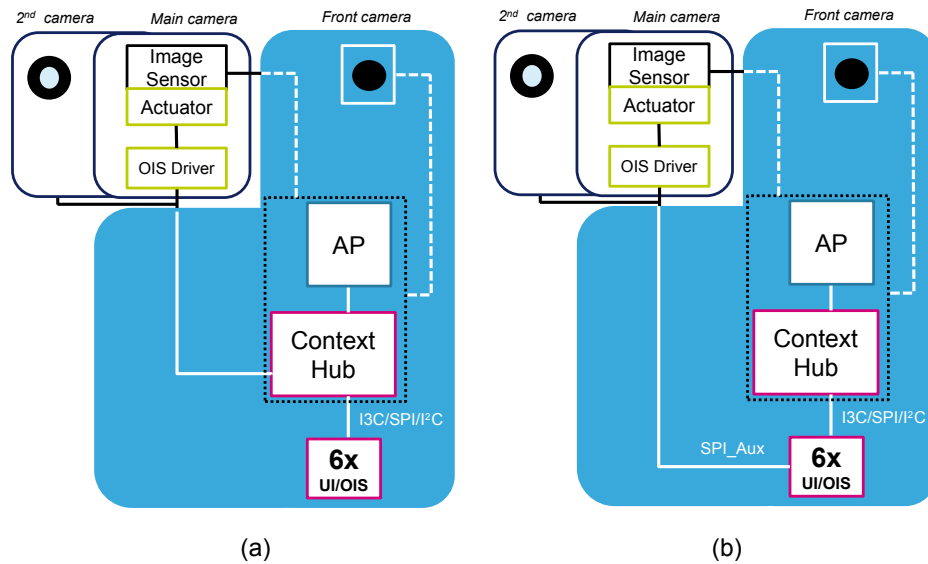

Note: *If the accelerometer Ultra-Low-Power Mode is active when activation of the OIS is required, the device must be set in Power-Down mode before enabling the OIS chain.*

The OIS_ON_EN bit is reset from the SW RESET procedure.

6.5.1.3 Primary interface full control

This option allows the application processor to configure all OIS functionalities from the primary interface. This option allows using embedded OIS data for both the main and front camera, connecting them to the application processor (eventually adding a context hub) as shown in Figure 23: the AP can also do some processing on the data before sending them to the cameras.

In order to place the device in this mode, the OIS_CTRL_FROM_UI bit in the FUNC_CFG_ACCESS (01h) register must be set to '1' from the primary interface.

Figure 23. OIS Primary interface full control

Then, the AP can configure OIS functionalities through [UI_INT_OIS \(6Fh\)](#), [UI_CTRL1_OIS \(70h\)](#), [UI_CTRL2_OIS \(71h\)](#), [UI_CTRL3_OIS \(72h\)](#).

The `OIS_EN_SPI2` bit in the [UI_CTRL1_OIS \(70h\)](#) register enables the gyroscope OIS chain.

Reading from the Auxiliary SPI can be enabled by setting the `SPI2_READ_EN` bit in the [UI_INT_OIS \(6Fh\)](#) register to '1' in order to directly read OIS data (as shown in [Figure 23 \(b\)](#)). The Auxiliary SPI can access the [SPI2_INT_OIS \(6Fh\)](#), [SPI2_CTRL1_OIS \(70h\)](#), [SPI2_CTRL2_OIS \(71h\)](#), and [SPI2_CTRL3_OIS \(72h\)](#) registers in read-only mode.

Note: If the accelerometer Ultra-Low-Power Mode is active when activation of the OIS is required, the device must be set in Power-Down mode before enabling the OIS chain.

The `OIS_CTRL_FROM_UI` bit is reset from the SW RESET procedure.

S4S is not available in the primary interface full control mode.

6.6 FIFO

The presence of a FIFO allows consistent power saving for the system since the host processor does not need continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO.

The LSM6DSOX embeds 3 kbytes of data in FIFO to store the following data:

- Gyroscope
- Accelerometer
- External sensors (up to 4)
- Step counter
- Timestamp
- Temperature

Writing data in the FIFO can be configured to be triggered by the:

- Accelerometer / gyroscope data-ready signal
- Sensor hub data-ready signal
- Step detection signal

The applications have maximum flexibility in choosing the rate of batching for physical sensors with FIFO-dedicated configurations: accelerometer, gyroscope and temperature sensor batching rates can be selected by the user. External sensor writing in FIFO can be triggered by the accelerometer data-ready signal or by an external sensor interrupt. The step counter can be stored in FIFO with associated timestamp each time a step is detected. It is possible to select decimation for timestamp batching in FIFO with a factor of 1, 8, or 32.

The reconstruction of a FIFO stream is a simple task thanks to the FIFO_DATA_OUT_TAG byte that allows recognizing the meaning of a word in FIFO.

FIFO allows correct reconstruction of the timestamp information for each sensor stored in FIFO. If a change in the ODR or BDR (Batching Data Rate) configuration is performed, the application can correctly reconstruct the timestamp and know exactly when the change was applied without disabling FIFO batching. FIFO stores information of the new configuration and timestamp in which the change was applied in the device.

Finally, FIFO embeds a compression algorithm that the user can enable in order to have up to 9 kbyte data stored in FIFO and take advantage of interface communication length for FIFO flushing and communication power consumption.

The programmable FIFO watermark threshold can be set in FIFO_CTRL1 (07h) and FIFO_CTRL2 (08h) using the WTM[8:0] bits. To monitor the FIFO status, dedicated registers (FIFO_STATUS1 (3Ah), FIFO_STATUS2 (3Bh)) can be read to detect FIFO overrun events, FIFO full status, FIFO empty status, FIFO watermark status and the number of unread samples stored in the FIFO. To generate dedicated interrupts on the INT1 and INT2 pins of these status events, the configuration can be set in INT1_CTRL (0Dh) and INT2_CTRL (0Eh).

The FIFO buffer can be configured according to six different modes:

- Bypass mode
- FIFO mode
- Continuous mode
- Continuous-to-FIFO mode
- Bypass-to-continuous mode
- Bypass-to-FIFO mode

Each mode is selected by the FIFO_MODE_[2:0] bits in the FIFO_CTRL4 (0Ah) register.

6.6.1 Bypass mode

In Bypass mode (FIFO_CTRL4 (0Ah)(FIFO_MODE_[2:0] = 000), the FIFO is not operational and it remains empty. Bypass mode is also used to reset the FIFO when in FIFO mode.

6.6.2 FIFO mode

In FIFO mode (FIFO_CTRL4 (0Ah)(FIFO_MODE_[2:0] = 001) data from the output channels are stored in the FIFO until it is full.

To reset FIFO content, Bypass mode should be selected by writing **FIFO_CTRL4 (0Ah)**(FIFO_MODE_[2:0]) to '000'. After this reset command, it is possible to restart FIFO mode by writing **FIFO_CTRL4 (0Ah)** (FIFO_MODE_[2:0]) to '001'.

The FIFO buffer memorizes up to 9 kbytes of data (with compression enabled) but the depth of the FIFO can be resized by setting the WTM [8:0] bits in **FIFO_CTRL1 (07h)** and **FIFO_CTRL2 (08h)**. If the STOP_ON_WTM bit in **FIFO_CTRL2 (08h)** is set to '1', FIFO depth is limited up to the WTM [8:0] bits in **FIFO_CTRL1 (07h)** and **FIFO_CTRL2 (08h)**.

6.6.3 Continuous mode

Continuous mode (**FIFO_CTRL4 (0Ah)**(FIFO_MODE_[2:0] = 110) provides a continuous FIFO update: as new data arrives, the older data is discarded.

A FIFO threshold flag **FIFO_STATUS2 (3Bh)**(FIFO_WTM_IA) is asserted when the number of unread samples in FIFO is greater than or equal to **FIFO_CTRL1 (07h)** and **FIFO_CTRL2 (08h)**(WTM [8:0]).

It is possible to route the FIFO_WTM_IA flag to **FIFO_CTRL2 (08h)** to the INT1 pin by writing in register **INT1_CTRL (0Dh)**(INT1_FIFO_TH) = '1' or to the INT2 pin by writing in register **INT2_CTRL (0Eh)** (INT2_FIFO_TH) = '1'.

A full-flag interrupt can be enabled, **INT1_CTRL (0Dh)**(INT1_FIFO_FULL) = '1' or **INT2_CTRL (0Eh)** (INT2_FIFO_FULL) = '1', in order to indicate FIFO saturation and eventually read its content all at once.

If an overrun occurs, at least one of the oldest samples in FIFO has been overwritten and the FIFO_OVR_IA flag in **FIFO_STATUS2 (3Bh)** is asserted.

In order to empty the FIFO before it is full, it is also possible to pull from FIFO the number of unread samples available in **FIFO_STATUS1 (3Ah)** and **FIFO_STATUS2 (3Bh)**(DIFF_FIFO_[9:0]).

6.6.4 Continuous-to-FIFO mode

In Continuous-to-FIFO mode (**FIFO_CTRL4 (0Ah)**(FIFO_MODE_[2:0] = 011), FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

When the selected trigger bit is equal to '1', FIFO operates in FIFO mode.

When the selected trigger bit is equal to '0', FIFO operates in Continuous mode.

6.6.5 Bypass-to-Continuous mode

In Bypass-to-Continuous mode (**FIFO_CTRL4 (0Ah)**(FIFO_MODE_[2:0] = '100'), data measurement storage inside FIFO operates in Continuous mode when selected triggers are equal to '1', otherwise FIFO content is reset (Bypass mode).

FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

6.6.6 Bypass-to-FIFO mode

In Bypass-to-FIFO mode (**FIFO_CTRL4 (0Ah)**(FIFO_MODE_[2:0] = '111'), data measurement storage inside FIFO operates in FIFO mode when selected triggers are equal to '1', otherwise FIFO content is reset (Bypass mode).

FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

6.6.7 FIFO reading procedure

The data stored in FIFO are accessible from dedicated registers and each FIFO word is composed of 7 bytes: one tag byte ([FIFO_DATA_OUT_TAG \(78h\)](#)), in order to identify the sensor, and 6 bytes of fixed data ([FIFO_DATA_OUT](#) registers from (79h) to (7Eh)).

The [DIFF_FIFO_\[9:0\]](#) field in the [FIFO_STATUS1 \(3Ah\)](#) and [FIFO_STATUS2 \(3Bh\)](#) registers contains the number of words (1 byte TAG + 6 bytes DATA) collected in FIFO.

In addition, it is possible to configure a counter of the batch events of accelerometer or gyroscope sensors. The flag [COUNTER_BDR_IA](#) in [FIFO_STATUS2 \(3Bh\)](#) alerts that the counter reaches a selectable threshold ([CNT_BDR_TH_\[10:0\]](#) field in [COUNTER_BDR_REG1 \(0Bh\)](#) and [COUNTER_BDR_REG2 \(0Ch\)](#)). This allows triggering the reading of FIFO with the desired latency of one single sensor. The sensor is selectable using the [TRIG_COUNTER_BDR](#) bit in [COUNTER_BDR_REG1 \(0Bh\)](#). As for the other FIFO status events, the flag [COUNTER_BDR_IA](#) can be routed on the INT1 or INT2 pins by asserting the corresponding bits ([INT1_CNT_BDR](#) of [INT1_CTRL \(0Dh\)](#) and [INT2_CNT_BDR](#) of [INT2_CTRL \(0Eh\)](#)).

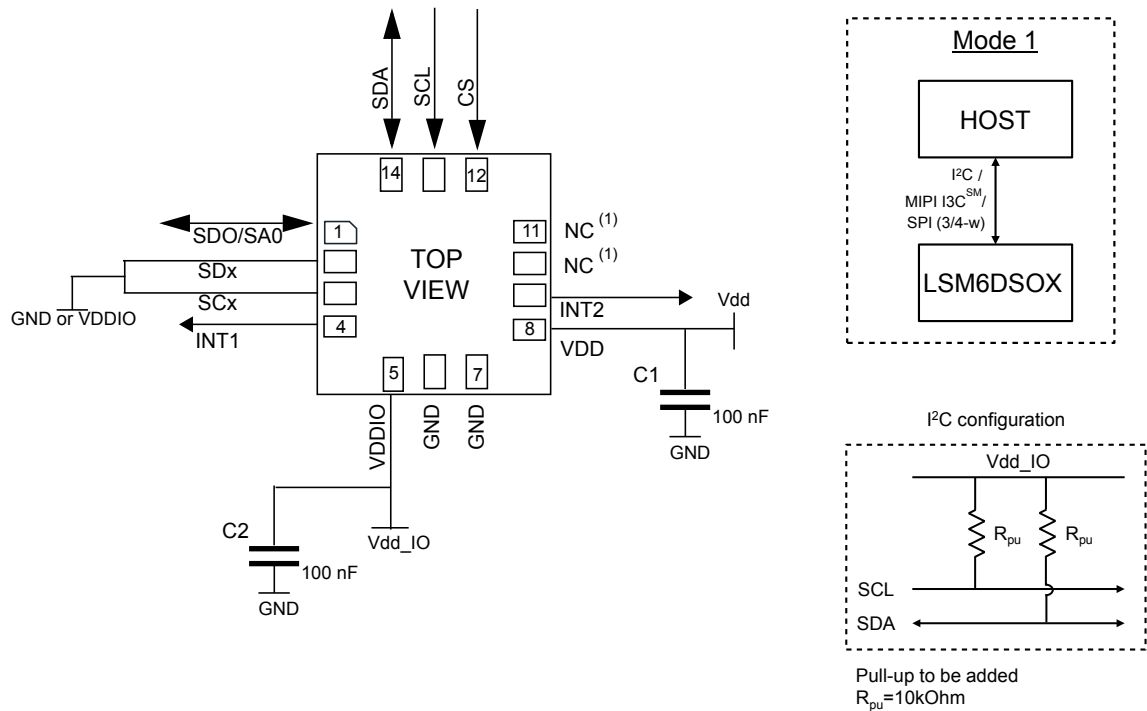

In order to maximize the amount of accelerometer and gyroscope data in FIFO, the user can enable the compression algorithm by setting to 1 both the [FIFO_COMPR_EN](#) bit in [EMB_FUNC_EN_B \(05h\)](#) (embedded functions registers bank) and the [FIFO_COMPR_RT_EN](#) bit in [FIFO_CTRL2 \(08h\)](#). When compression is enabled, it is also possible to force writing non-compressed data at a selectable rate using the [UNCOPTR_RATE_\[1:0\]](#) field in [FIFO_CTRL2 \(08h\)](#).

Meta information about accelerometer and gyroscope sensor configuration changes can be managed by enabling the [ODR_CHG_EN](#) bit in [FIFO_CTRL2 \(08h\)](#).

7.1 LSM6DSOX electrical connections in Mode 1

Figure 24. LSM6DSOX electrical connections in Mode 1

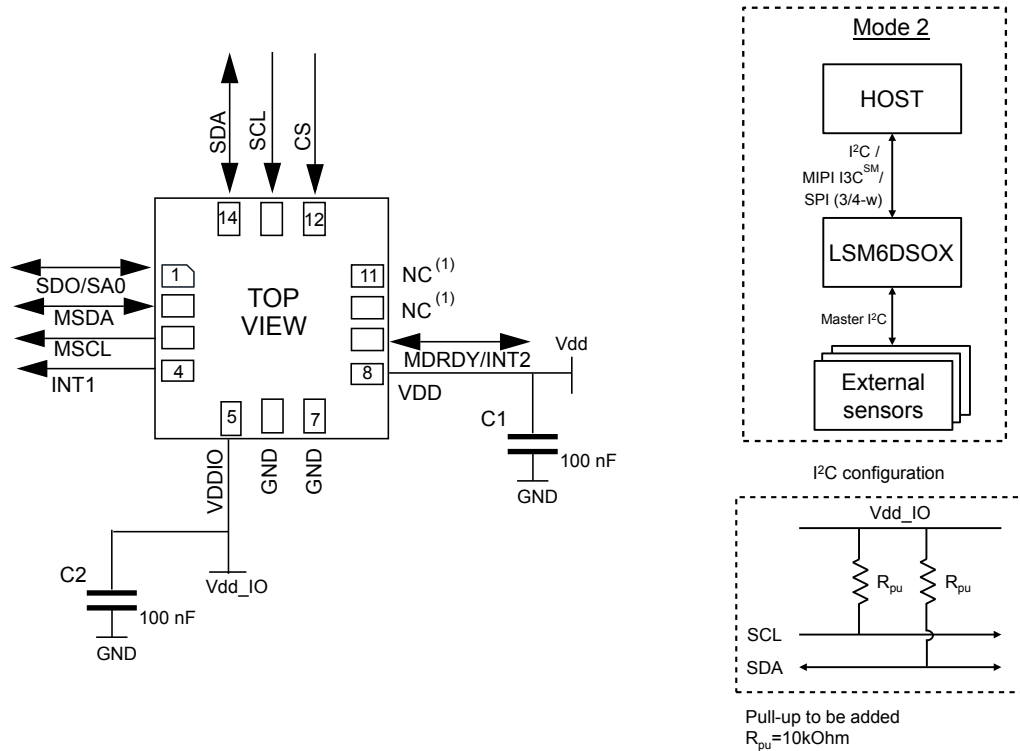

1. Leave pin electrically unconnected and soldered to PCB.

The device core is supplied through the Vdd line. Power supply decoupling capacitors (C1, C2 = 100 nF ceramic) should be placed as near as possible to the supply pin of the device (common design practice).

The functionality of the device and the measured acceleration/angular rate data is selectable and accessible through the SPI/I²C/MIPI I3CSM interface.

The functions, the threshold and the timing of the two interrupt pins for each sensor can be completely programmed by the user through the SPI/I²C/MIPI I3CSM interface.

7.2 LSM6DSOX electrical connections in Mode 2

Figure 25. LSM6DSOX electrical connections in Mode 2

1. Leave pin electrically unconnected and soldered to PCB.

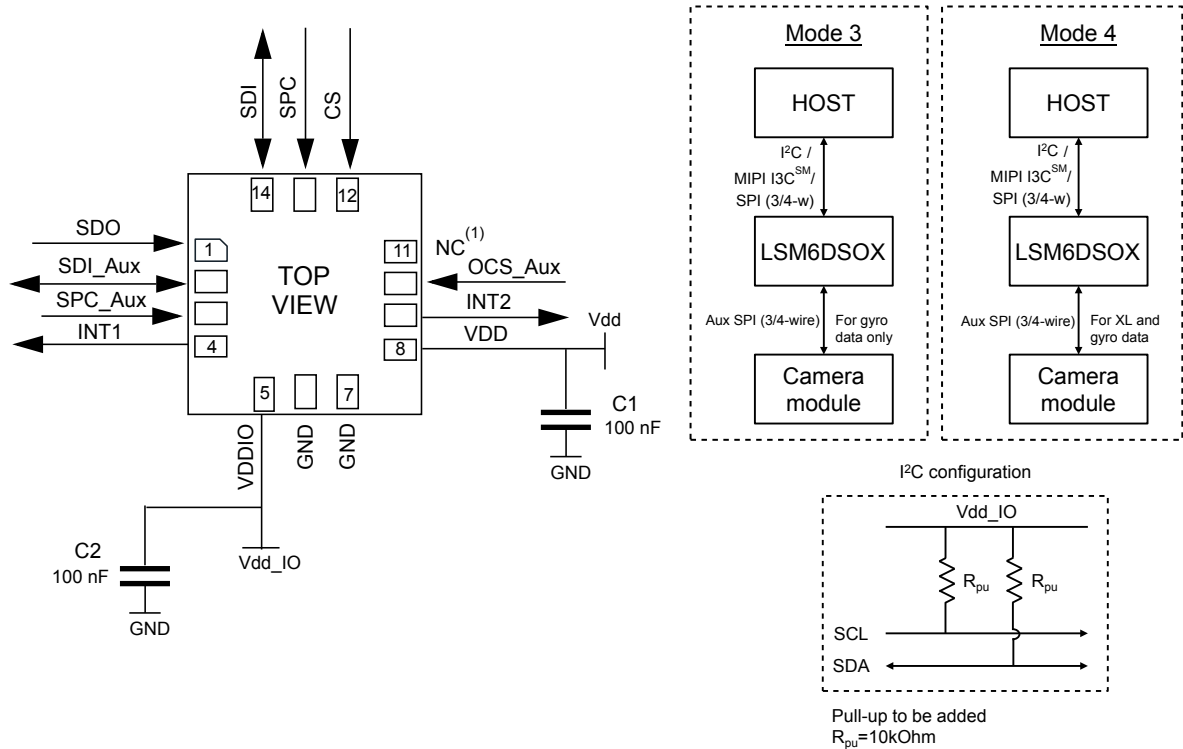

The device core is supplied through the Vdd line. Power supply decoupling capacitors (C1, C2 = 100 nF ceramic) should be placed as near as possible to the supply pin of the device (common design practice).

The functionality of the device and the measured acceleration/angular rate data is selectable and accessible through the SPI/I²C/MIPI I3CSM primary interface.

The functions, the threshold and the timing of the two interrupt pins for each sensor can be completely programmed by the user through the SPI/I²C/MIPI I3CSM primary interface.

7.3 LSM6DSOX electrical connections in Mode 3 and Mode 4

Figure 26. LSM6DSOX electrical connections in Mode 3 and Mode 4 (auxiliary 3/4-wire SPI)

1. Leave pin electrically unconnected and soldered to PCB.

Note: When Mode 3 and 4 are used, the pull-up on pins 10 and 11 can be disabled (refer to [Table 20. Internal pin status](#)). To avoid leakage current, it is recommended to not leave the SPI lines floating (also when the OIS system is off).

The device core is supplied through the Vdd line. Power supply decoupling capacitors (C1, C2 = 100 nF ceramic) should be placed as near as possible to the supply pin of the device (common design practice).

The functionality of the device is selectable and accessible through the SPI/I²C/I³C primary interface.

Measured acceleration/angular rate data is selectable and accessible through the SPI/I²C/MIPI I3CSM primary interface and auxiliary SPI.

1. Mode 3 is enabled when the OIS_EN_SPI2 bit in the UI_CTRL1_OIS (70h) / SPI2_CTRL1_OIS (70h) registers is set to 1. Mode 4 is enabled when both the OIS_EN_SPI2 bit and the Mode4_EN bit in the UI_CTRL1_OIS (70h) / SPI2_CTRL1_OIS (70h) registers are set to 1.
2. INT1 must be set to '0' or left unconnected during power-on if the I²C/SPI interfaces are used.

Internal pull-up value is from 30 kΩ to 50 kΩ, depending on VDDIO.

Note: The procedure to enable the pull-up on pins 2 and 3 is as follows:

1. From the primary I²C/I³C/SPI interface: write 40h in register at address 01h (enable access to the sensor hub registers)
2. From the primary I²C/I³C/SPI interface: write 08h in register at address 14h (enable the pull-up on pins 2 and 3)
3. From the primary I²C/I³C/SPI interface: write 00h in register at address 01h (disable access to the sensor hub registers)

9 Register description

The device contains a set of registers which are used to control its behavior and to retrieve linear acceleration, angular rate and temperature data. The register addresses, made up of 7 bits, are used to identify them and to write the data through the serial interface.

9.12 INT1_CTRL (0Dh)

INT1 pin control register (r/w)

Each bit in this register enables a signal to be carried out on INT1 when the MIPI I3CSM dynamic address is not assigned (I²C or SPI is used). Some bits can be also used to trigger an IBI (In-Band Interrupt) when the MIPI I3CSM interface is used. The output of the pin will be the OR combination of the signals selected here and in MD1_CFG (5Eh).

Table 71. CTRL8_XL register description

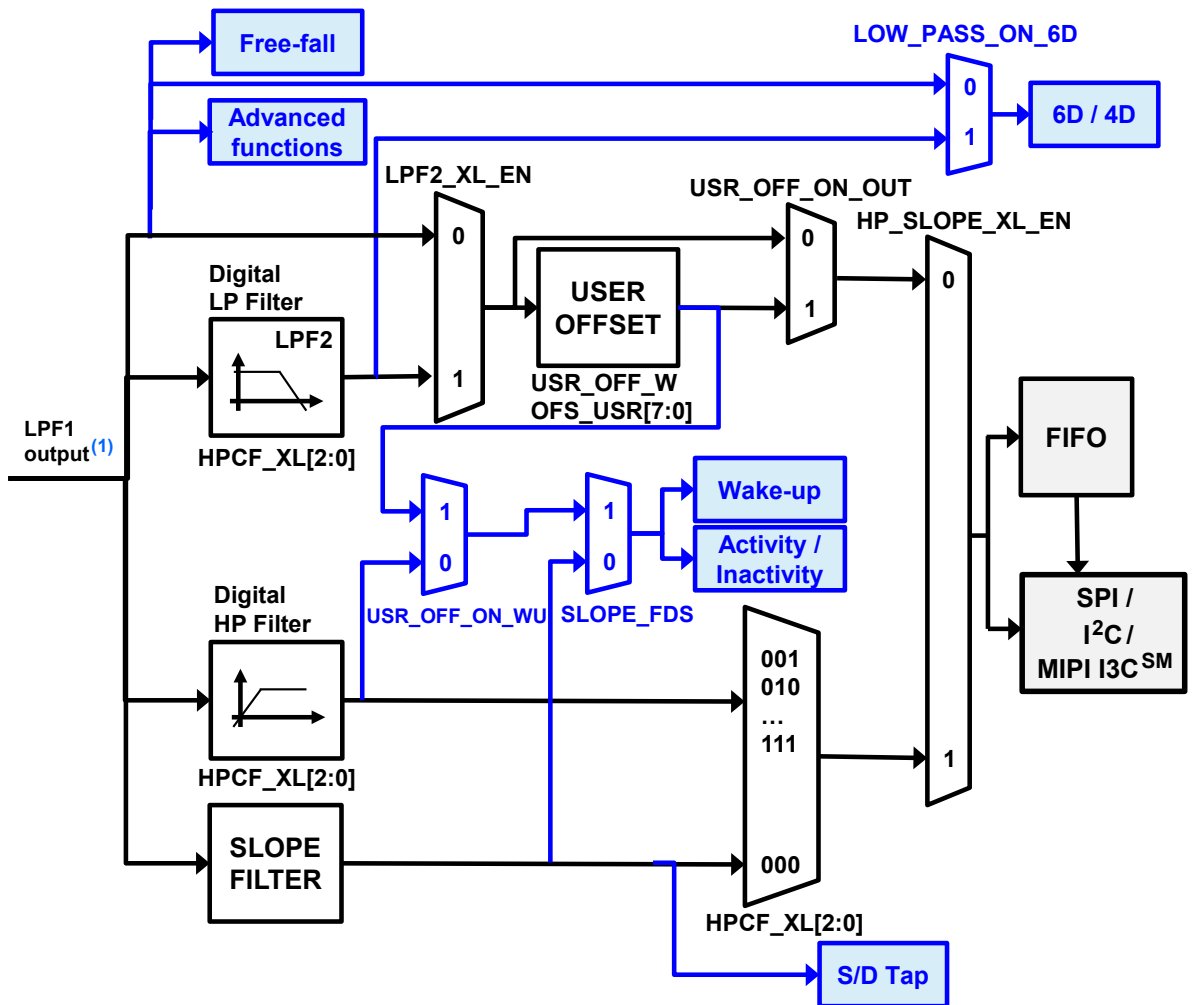

HPCF_XL_[2:0]	Accelerometer LPF2 and HP filter configuration and cutoff setting. Refer to Table 72 .
HP_REF_MODE_XL	Enables accelerometer high-pass filter reference mode (valid for high-pass path - HP_SLOPE_XL_EN bit must be '1'). Default value: 0 ⁽¹⁾ (0: disabled, 1: enabled)
FASTSETTL_MODE_XL	Enables accelerometer LPF2 and HPF fast-settling mode. The filter sets the second samples after writing this bit. Active only during device exit from power-down mode. Default value: 0 (0: disabled, 1: enabled)
HP_SLOPE_XL_EN	Accelerometer slope filter / high-pass filter selection. Refer to Figure 27 .
XL_FS_MODE	Accelerometer full-scale management between UI chain and OIS chain (0: Old full-scale mode. When XL UI is on, the full scale is the same between UI/OIS and is chosen by the UI CTRL registers; when XL UI is in PD, the OIS can choose the FS. 1: New full-scale mode. Full scales are independent between the UI/OIS chain but both bound to ±8 g.)
LOW_PASS_ON_6D	LPF2 on 6D function selection. Refer to Figure 27 . Default value: 0 (0: ODR/2 low-pass filtered data sent to 6D interrupt function; 1: LPF2 output data sent to 6D interrupt function)

1. When enabled, the first output data have to be discarded.

Table 155. INT_DUR2 register description

DUR[3:0]	Duration of maximum time gap for double tap recognition. Default: 0000 When double tap recognition is enabled, this register expresses the maximum time between two consecutive detected taps to determine a double tap event. The default value of these bits is 0000b which corresponds to 16*ODR_XL time. If the DUR[3:0] bits are set to a different value, 1LSB corresponds to 32*ODR_XL time.
QUIET[1:0]	Expected quiet time after a tap detection. Default value: 00 Quiet time is the time after the first detected tap in which there must not be any overthreshold event. The default value of these bits is 00b which corresponds to 2*ODR_XL time. If the QUIET[1:0] bits are set to a different value, 1LSB corresponds to 4*ODR_XL time.
SHOCK[1:0]	Maximum duration of overthreshold event. Default value: 00 Maximum duration is the maximum time of an overthreshold signal detection to be recognized as a tap event. The default value of these bits is 00b which corresponds to 4*ODR_XL time. If the SHOCK[1:0] bits are set to a different value, 1LSB corresponds to 8*ODR_XL time.

INT2_DRDY_OIS	Enables OIS chain DRDY on INT2 pin. This setting has priority over all other INT2 settings.
LVL2_OIS	Enables level-sensitive latched mode on the OIS chain. Default value: 0
DEN_LH_OIS	Indicates polarity of DEN signal on OIS chain (0: DEN pin is active-low; 1: DEN pin is active-high)
SPI2_READ_EN	In Primary IF full control mode, enables Auxiliary SPI for reading OIS data in registers SPI2_OUTX_L_G_OIS (22h) and SPI2_OUTX_H_G_OIS (23h) through SPI2_OUTZ_L_A_OIS (2Ch) and SPI2_OUTZ_H_A_OIS (2Dh) . Default value: 0 (0: OIS data reading from Auxiliary SPI disabled; 1: OIS data reading from Auxiliary SPI enabled)

9.67 UI_CTRL1_OIS (70h)

OIS configuration register. The primary interface can write this register when the OIS_CTRL_FROM_UI bit in the [FUNC_CFG_ACCESS \(01h\)](#) register is equal to 1 (Primary IF Full control mode); this register is read-only when the OIS_CTRL_FROM_UI bit is equal to 0 (SPI2 Full control mode) and shows the content of the [SPI2_CTRL1_OIS \(70h\)](#) register.

LVL1_OIS	Enables level-sensitive trigger mode on OIS chain. Default value: 0
SIM_OIS	SPI2 3- or 4-wire interface. Default value: 0 (0: 4-wire SPI2; 1: 3-wire SPI2)
Mode4_EN	Enables accelerometer OIS chain. When the OIS_CTRL_FROM_UI bit in the FUNC_CFG_ACCESS (01h) register is equal to 1 (Primary IF Full control mode enabled), the accelerometer OIS outputs are available through the primary interface in registers UI_OUTX_L_A_OIS (50h) and UI_OUTX_H_A_OIS (51h) through UI_OUTZ_L_A_OIS (54h) and UI_OUTZ_H_A_OIS (55h) and UI_STATUS_REG_OIS (49h) . Note: OIS_EN_SPI2 must be enabled (i.e. set to '1') to enable also the XL OIS chain.
FS[1:0]_G_OIS	Selects gyroscope OIS chain full-scale (00: 250 dps; 01: 500 dps; 10: 1000 dps; 11: 2000 dps)
FS_125_OIS	Selects gyroscope OIS chain full-scale 125 dps (0: FS selected through bits FS[1:0]_OIS_G; 1: 125 dps)
OIS_EN_SPI2	Enables OIS chain data processing for gyro in Mode 3 and Mode 4 (mode4_en = 1) and accelerometer data in and Mode 4 (mode4_en = 1). When the OIS_CTRL_FROM_UI bit in FUNC_CFG_ACCESS (01h) register is equal to 1 (Primary IF Full control mode enabled), the gyroscope OIS outputs are available through the primary interface in registers UI_OUTX_L_G_OIS (4Ah) and UI_OUTX_H_G_OIS (4Bh) through UI_OUTZ_L_G_OIS (4Eh) and UI_OUTZ_H_G_OIS (4Fh) and UI_STATUS_REG_OIS (49h) , and LPF1 is dedicated to this chain.

DEN mode selection can be done using the LVL1_OIS bit of register [UI_CTRL1_OIS \(70h\)](#) and the LVL2_OIS bit of register [UI_INT_OIS \(6Fh\)](#).

DEN mode on the OIS path is active in the gyroscope only.

INT2_DRDY_OIS	Enables OIS chain DRDY on INT2 pin. This setting has priority over all other INT2 settings.
LVL2_OIS	Enables level-sensitive latched mode on the OIS chain. Default value: 0
DEN_LH_OIS	Indicates polarity of DEN signal on OIS chain (0: DEN pin is active-low; 1: DEN pin is active-high)
ST[1:0]_XL_OIS	Selects accelerometer self-test – effective only if XL OIS chain is enabled. Default value: 00 (00: Normal mode; 01: Positive sign self-test; 10: Negative sign self-test; 11: not allowed)

11.11 SPI2_CTRL1_OIS (70h)

OIS configuration register. The auxiliary SPI interface can write this register when the OIS_CTRL_FROM_UI bit in the FUNC_CFG_ACCESS (01h) register is equal to 0 (SPI2 Full control mode); this register is read-only when the OIS_CTRL_FROM_UI bit is equal to 1 (Primary IF Full control mode) and shows the content of the UI_INT_OIS (6Fh) register.

SIM_OIS	SPI2 3- or 4-wire interface. Default value: 0 (0: 4-wire SPI2; 1: 3-wire SPI2)
Mode4_EN	Enables accelerometer OIS chain. OIS outputs are available through SPI2 in registers SPI2_OUTX_L_A_OIS (28h) and SPI2_OUTX_H_A_OIS (29h) through SPI2_OUTZ_L_A_OIS (2Ch) and SPI2_OUTZ_H_A_OIS (2Dh) and SPI2_STATUS_REG_OIS (1Eh). Note: OIS_EN_SPI2 must be enabled (i.e. set to '1') to enable also the XL OIS chain.
FS[1:0]_G_OIS	Selects gyroscope OIS chain full-scale (00: 250 dps; 01: 500 dps; 10: 1000 dps; 11: 2000 dps)
FS_125_OIS	Selects gyroscope OIS chain full-scale 125 dps (0: FS selected through bits FS[1:0]_OIS_G; 1: 125 dps)
OIS_EN_SPI2	Enables OIS chain data processing for gyro in Mode 3 and Mode 4 (mode4_en = 1) and accelerometer data in and Mode 4 (mode4_en = 1). When the OIS chain is enabled, the OIS outputs are available through the SPI2 in registers SPI2_OUTX_L_G_OIS (22h) and SPI2_OUTX_H_G_OIS (23h) through SPI2_OUTZ_L_G_OIS (26h) and SPI2_OUTZ_H_G_OIS (27h) and STATUS_REG (1Eh) and SPI2_STATUS_REG_OIS (1Eh), and LPF1 is dedicated to this chain.

DEN mode selection can be done using the LVL1_OIS bit of register UI_CTRL1_OIS (70h) and the LVL2_OIS bit of register UI_INT_OIS (6Fh).

DEN mode on the OIS path is active in the gyroscope only.

Registers marked as Reserved must not be changed. Writing to those registers may cause permanent damage to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

Registers marked as Reserved must not be changed. Writing to those registers may cause permanent damage to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

Write procedure example: write value 06h register at address 84h (PEDO_DEB_STEPS_CONF) in Page 1

1. Write bit FUNC_CFG_EN = 1 in FUNC_CFG_ACCESS (01h) // Enable access to embedded functions registers
2. Write bit PAGE_WRITE = 1 in PAGE_RW (17h) register // Select write operation mode
3. Write 0001 in PAGE_SEL[3:0] field of register PAGE_SEL (02h) // Select page 1
4. Write 84h in PAGE_ADDR register (08h) // Set address
5. Write 06h in PAGE_DATA register (09h) // Set value to be written
6. Write bit PAGE_WRITE = 0 in PAGE_RW (17h) register // Write operation disabled
7. Write bit FUNC_CFG_EN = 0 in FUNC_CFG_ACCESS (01h) // Disable access to embedded functions registers

Read procedure example: read value of register at address 84h (PEDO_DEB_STEPS_CONF) in Page 1

1. Write bit FUNC_CFG_EN = 1 in FUNC_CFG_ACCESS (01h) // Enable access to embedded functions registers
2. Write bit PAGE_READ = 1 in PAGE_RW (17h) register // Select read operation mode
3. Write 0001 in PAGE_SEL[3:0] field of register PAGE_SEL (02h) // Select page 1
4. Write 84h in PAGE_ADDR register (08h) // Set address
5. Read value of PAGE_DATA register (09h) // Get register value
6. Write bit PAGE_READ = 0 in PAGE_RW (17h) register // Read operation disabled
7. Write bit FUNC_CFG_EN = 0 in FUNC_CFG_ACCESS (01h) // Disable access to embedded functions registers

Note: Steps 1 and 2 of both procedures are intended to be performed at the beginning of the procedure. Steps 6 and 7 of both procedures are intended to be performed at the end of the procedure. If the procedure involves multiple operations, only steps 3, 4 and 5 must be repeated for each operation. If, in particular, the multiple operations involve consecutive registers, only step 5 can be performed.

15 Embedded advanced features register description

15.1 Page 0 - Embedded advanced features registers

15.1.1 MAG_SENSITIVITY_L (BAh) and MAG_SENSITIVITY_H (BBh)

External magnetometer sensitivity value register for the Finite State Machine (r/w).

This register corresponds to the LSB-to-gauss conversion value of the external magnetometer sensor. The register value is expressed as half-precision floating-point format: SEEEEEEEEEEEEEE (S: 1 sign bit; E: 5 exponent bits; F: 10 fraction bits).

Default value of MAG_SENS[15:0] is 0x1624, corresponding to 0.0015 gauss/LSB.

15.2.7 MLC_MAG_SENSITIVITY_L (E8h) and MLC_MAG_SENSITIVITY_H (E9h)

External magnetometer sensitivity value register for the Machine Learning Core (r/w).

This register corresponds to the LSB-to-gauss conversion value of the external magnetometer sensor. The register value is expressed as half-precision floating-point format: S EEEEEEEEEEEEEEE (S: 1 sign bit; E: 5 exponent bits; F: 10 fraction bits). Default value of MLC_MAG_S_[15:0] is 0x3C00, corresponding to 1 gauss/LSB.

Registers marked as Reserved must not be changed. Writing to those registers may cause permanent damage to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

18 Soldering information

The LGA package is compliant with the ECOPACK[®], RoHS and "Green" standard.
It is qualified for soldering heat resistance according to JEDEC J-STD-020.
Land pattern and soldering recommendations are available at www.st.com/mems.

19 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK® is an ST trademark.
