# CY8C20234 CY8C20334 and CY8C20434

### **Features**

#### ■ Low Power CapSense Block

- Configurable Capacitive Sensing Elements
- Supports Combination of CapSense Buttons, Sliders, Touchpads and Proximity Sensors

#### ■ Powerful Harvard Architecture Processor

- M8C Processor Speeds Running up to 12 MHz
- Low Power at High Speed
- 2.4V to 5.25V Operating Voltage
- Industrial Temperature Range: -40°C to +85°C

#### **■** Flexible On-Chip Memory

- ☐ 8K Flash Program Storage 50,000 Erase/Write Cycles
- ☐ 512 Bytes SRAM Data Storage
- Partial Flash Updates
- ☐ Flexible Protection Modes
- □ Interrupt Controller
- In-System Serial Programming (ISSP)

#### ■ Complete Development Tools

- □ Free Development Tool (PSoC Designer™)
- Full-Featured, In-Circuit Emulator and Programmer
- Full Speed Emulation
- Complex Breakpoint Structure
- 128K Trace Memory

#### ■ Precision, Programmable Clocking

- ☐ Internal ±5.0% 6/12 MHz Main Oscillator
- Internal Low Speed Oscillator at 32 kHz for Watchdog and Sleep

#### ■ Programmable Pin Configurations

- Pull Up, High Z, Open Drain, CMOS Drive Modes on All GPIO
- Up to 28 Analog Inputs on GPIO
- Configurable Inputs on All GPIO
- Selectable, Regulated Digital IO on Port 1
  - 3.0V, 20 mA Total Port 1 Source Current -- 5 mA Strong Drive Mode on Port 1

#### Versatile Analog Mux

- Common Internal Analog Bus
- Simultaneous Connection of IO Combinations
- Comparator Noise Immunity
- □ Low-Dropout Voltage Regulator for the Analog

#### Additional System Resources

- Configurable Communication Speeds
  - -- IŽC: Selectable to 50 kHz, 100 kHz or 400 kHz

  - SPI : Configurable between 46.9 kHz and 3 MHz
- □ I<sup>2</sup>C™ Slave
- □ SPI Master and SPI Slave
- Watchdog and Sleep Timers
- □ Internal Voltage Reference
- □ Integrated Supervisory Circuit

## **PSoC® Functional Overview**

The PSoC family consists of many Mixed-Signal Array with On-Chip Controller devices. These devices are designed to replace multiple traditional MCU-based system components with one, low cost single-chip programmable component. A PSoC device includes configurable analog and digital blocks, as well as programmable interconnect. This architecture allows the user to create customized peripheral configurations, to match the requirements of each individual application. Additionally, a fast CPU, Flash program memory, SRAM data memory, and configurable IO are included in a range of convenient pinouts.

The PSoC architecture for this device family, as illustrated on the left, is comprised of three main areas: the Core, the System Resources, and the CapSense Analog System. A common, versatile bus allows connection between IO and the analog system. Each CY8C20x34 PSoC device includes a dedicated CapSense block that provides sensing and scanning control circuitry for capacitive sensing applications. Depending on the PSoC package, up to 28 general purpose IO (GPIO) are also included. The GPIO provide access to the MCU and analog mux.

#### The PSoC Core

The PSoC Core is a powerful engine that supports a rich instruction set. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, and IMO (internal main oscillator) and ILO (internal low speed oscillator). The CPU core, called the M8C, is a powerful processor with speeds up to 12 MHz. The M8C is a two-MIPS, 8-bit Harvard architecture microprocessor.

System Resources provide additional capability, such as a configurable I2C slave/SPI master-slave communication interface and various system resets supported by the M8C.

The Analog System is composed of the CapSense PSoC block and an internal 1.8V analog reference, which together support capacitive sensing of up to 28 inputs.

## The CapSense Analog System

The Analog System contains the capacitive sensing hardware. Several hardware algorithms are supported. This hardware performs capacitive sensing and scanning without requiring external components. Capacitive sensing is configurable on each GPIO pin. Scanning of enabled CapSense pins can be completed quickly and easily across multiple ports.

**Analog System Block Diagram** 

#### The Analog Multiplexer System

The Analog Mux Bus can connect to every GPIO pin. Pins can be connected to the bus individually or in any combination. The bus also connects to the analog system for analysis with the CapSense block comparator.

Switch control logic enables selected pins to precharge continuously under hardware control. This enables capacitive measurement for applications such as touch sensing. Other multiplexer applications include:

- Complex capacitive sensing interfaces, such as sliders and touchpads.
- Chip-wide mux that allows analog input from any IO pin.
- Crosspoint connection between any IO pin combinations.

#### Additional System Resources

System Resources, some of which have been previously listed, provide additional capability useful to complete systems. Additional resources include low voltage detection and power on reset. Brief statements describing the merits of each system resource are presented below.

- The I2C slave/SPI master-slave module provides 50/100/400 kHz communication over two wires. SPI communication over 3 or 4 wires runs at speeds of 46.9 kHz to 3 MHz (lower for a slower system clock).
- Low Voltage Detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced POR (Power On Reset) circuit eliminates the need for a system supervisor.
- An internal 1.8V reference provides an absolute reference for capacitive sensing.
- The 5V maximum input, 3V fixed output, low-dropout regulator (LDO) provides regulation for IOs. A register-controlled bypass mode allows the user to disable the LDO.

## **Getting Started**

The quickest path to understanding the PSoC silicon is by reading this data sheet and using the PSoC Designer Integrated Development Environment (IDE). This data sheet is an overview of the PSoC integrated circuit and presents specific pin, register, and electrical specifications. For in-depth information, along with detailed programming information, reference the PSoC Mixed-Signal Array Technical Reference Manual, which can be found on <a href="http://www.cypress.com/psoc">http://www.cypress.com/psoc</a>.

For up-to-date Ordering, Packaging, and Electrical Specification information, reference the latest PSoC device data sheets on the web at http://www.cypress.com.

#### Development Kits

Development Kits are available from the following distributors: Digi-Key, Avnet, Arrow, and Future. The Cypress Online Store contains development kits, **C** compilers, and all accessories for PSoC development. Go to the Cypress Online Store web site at <a href="http://www.cypress.com">http://www.cypress.com</a>, click the Online Store shopping cart icon at the bottom of the web page, and click *PSoC (Programmable System-on-Chip)* to view a current list of available items.

#### Technical Training

Free PSoC technical training is available for beginners and is taught by a marketing or application engineer over the phone. PSoC training classes cover designing, debugging, advanced analog, as well as application-specific classes covering topics such as PSoC and the LIN bus. Go to <a href="https://www.cypress.com">https://www.cypress.com</a>, click on Design Support located on the left side of the web page, and select Technical Training for more details.

#### Consultants

Certified PSoC Consultants offer everything from technical assistance to completed PSoC designs. To contact or become a PSoC Consultant go to <a href="http://www.cypress.com">http://www.cypress.com</a>, click on Design Support located on the left side of the web page, and select CYPros Consultants.

## **Technical Support**

PSoC application engineers take pride in fast and accurate response. They can be reached with a 4-hour guaranteed response at http://www.cypress.com/support/login.cfm.

## **Application Notes**

A long list of application notes will assist you in every aspect of your design effort. To view the PSoC application notes, go to the <a href="http://www.cypress.com">http://www.cypress.com</a> web site and select Application Notes under the Design Resources list located in the center of the web page. Application notes are sorted by date by default.

## **Development Tools**

PSoC Designer is a Microsoft® Windows-based, integrated development environment for the Programmable System-on-Chip (PSoC) devices. The PSoC Designer IDE and application runs on Windows NT 4.0, Windows 2000, Windows Millennium (Me), or Windows XP. (Reference the PSoC Designer Functional Flow diagram below.)

PSoC Designer helps the customer to select an operating configuration for the PSoC, write application code that uses the PSoC, and debug the application. This system provides design database management by project, an integrated debugger with In-Circuit Emulator, in-system programming support, and the CYASM macro assembler for the CPUs.

PSoC Designer also supports a high-level C language compiler developed specifically for the devices in the family.

**PSoC Designer Subsystems** 

## **PSoC Designer Software Subsystems**

#### Device Editor

The device editor subsystem allows the user to select different onboard analog and digital components called user modules using the PSoC blocks. Examples of user modules are ADCs, DACs, Amplifiers, and Filters.

The device editor also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic reconfiguration allows for changing configurations at run time.

PSoC Designer sets up power-on initialization tables for selected PSoC block configurations and creates source code for an application framework. The framework contains software to operate the selected components and, if the project uses more than one operating configuration, contains routines to switch between different sets of PSoC block configurations at run time. PSoC Designer can print out a configuration sheet for a given project configuration for use during application programming in conjunction with the Device Data Sheet. Once the framework is generated, the user can add application-specific code to flesh out the framework. It's also possible to change the selected components and regenerate the framework.

#### Application Editor

In the Application Editor you can edit your C language and Assembly language source code. You can also assemble, compile, link, and build.

**Assembler.** The macro assembler allows the assembly code to be merged seamlessly with C code. The link libraries automatically use absolute addressing or can be compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compiler. A C language compiler is available that supports the PSoC family of devices. Even if you have never worked in the C language before, the product quickly allows you to create complete C programs for the PSoC family devices.

The embedded, optimizing C compiler provides all the features of C tailored to the PSoC architecture. It comes complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

#### Debugger

The PSoC Designer Debugger subsystem provides hardware in-circuit emulation, allowing the designer to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow the designer to read the program and read and write data memory, read and write IO registers, read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also allows the designer to create a trace buffer of registers and memory locations of interest.

#### Online Help System

The online help system displays online, context-sensitive help for the user. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer in getting started.

#### Hardware Tools

#### In-Circuit Emulator

A low cost, high functionality ICE (In-Circuit Emulator) is available for development support. This hardware has the capability to program single devices.

The emulator consists of a base unit that connects to the PC by way of a USB port. The base unit is universal and will operate with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full speed (24 MHz) operation.

## **Designing with User Modules**

The development process for the PSoC device differs from that of a traditional fixed function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and by lowering inventory costs. These configurable resources, called PSoC Blocks, have the ability to implement a wide variety of user-selectable functions. Each block has several registers that determine its function and connectivity to other blocks, multiplexers, buses and to the IO pins. Iterative development cycles permit you to adapt the hardware as well as the software. This substantially lowers the risk of having to select a different part to meet the final design requirements.

To speed the development process, the PSoC Designer Integrated Development Environment (IDE) provides a library of pre-built, pre-tested hardware peripheral functions, called "User Modules." User modules make selecting and implementing peripheral devices simple, and come in analog, digital, and mixed signal varieties.

Each user module establishes the basic register settings that implement the selected function. It also provides parameters that allow you to tailor its precise configuration to your particular application. For example, a Pulse Width Modulator User Module configures one or more digital PSoC blocks, one for each 8 bits of resolution. The user module parameters permit you to establish the pulse width and duty cycle. User modules also provide tested software to cut your development time. The user module application programming interface (API) provides highlevel functions to control and respond to hardware events at run time. The API also provides optional interrupt service routines that you can adapt as needed.

The API functions are documented in user module data sheets that are viewed directly in the PSoC Designer IDE. These data sheets explain the internal operation of the user module and provide performance specifications. Each data sheet describes the use of each user module parameter and documents the setting of each register controlled by the user module.

The development process starts when you open a new project and bring up the Device Editor, a graphical user interface (GUI) for configuring the hardware. You pick the user modules you need for your project and map them onto the PSoC blocks with point-and-click simplicity. Next, you build signal chains by interconnecting user modules to each other and the IO pins. At this stage, you also configure the clock source connections and enter parameter values directly or by selecting values from drop-down menus. When you are ready to test the hardware configuration or move on to developing code for the project, you perform the "Generate Application" step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the high-level user module API functions.

**User Module and Source Code Development Flows** 

The next step is to write your main program, and any sub-routines using PSoC Designer's Application Editor subsystem. The Application Editor includes a Project Manager that allows you to open the project source code files (including all generated code files) from a hierarchal view. The source code editor provides syntax coloring and advanced edit features for both C and assembly language. File search capabilities include simple string searches and recursive "grep-style" patterns. A single mouse click invokes the Build Manager. It employs a professional-strength "makefile" system to automatically analyze all file dependencies and run the compiler and assembler as necessary. Project-level options control optimization strategies used by the compiler and linker. Syntax errors are displayed in a console window. Double clicking the error message takes you directly to the offending line of source code. When all is correct, the linker builds a HEX file image suitable for programming.

The last step in the development process takes place inside the PSoC Designer's Debugger subsystem. The Debugger downloads the HEX image to the In-Circuit Emulator (ICE) where it runs at full speed. Debugger capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint and watch-variable features, the Debugger provides a large trace buffer and allows you define complex breakpoint events that include monitoring address and data bus values, memory locations and external signals.

#### Units of Measure

A units of measure table is located in the Electrical Specifications section. Table 2-1 on page 11 lists all the abbreviations used to measure the PSoC devices.

## **Numeric Naming**

Hexidecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexidecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (e.g., 01010100b' or '01000011b'). Numbers not indicated by an 'h', 'b', or 0x are decimal.

# 1. Pin Information

This chapter describes, lists, and illustrates the CY8C20234, CY8C20334 and CY8C20434 PSoC device pins and pinout configurations.

## 1.1 Pinouts

The CY8C20x34 PSoC device is available in a variety of packages which are listed and illustrated in the following tables. Every port pin (labeled with a "P") is capable of Digital IO and connection to the common analog bus. However, Vss, Vdd, and XRES are not capable of Digital IO.

# 2. Electrical Specifications

This chapter presents the DC and AC electrical specifications of the CY8C20234, CY8C20334 and CY8C20434 PSoC devices. For the most up to date electrical specifications, confirm that you have the most recent data sheet by going to the web at http://www.cypress.com/psoc.

Specifications are valid for -40°C  $\leq$  T<sub>A</sub>  $\leq$  85°C and T<sub>J</sub>  $\leq$  100°C as specified, except where noted.

Refer to Table 2-10 for the electrical specifications on the internal main oscillator (IMO) using SLIMO mode.

## 2.3 DC Electrical Characteristics

## 2.3.1 DC Chip-Level Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and  $-40^{\circ}C \le T_A \le 85^{\circ}C$ , 3.0V to 3.6V and  $-40^{\circ}C \le T_A \le 85^{\circ}C$ , or 2.4V to 3.0V and  $-40^{\circ}C \le T_A \le 85^{\circ}C$ , respectively. Typical parameters apply to 5V, 3.3V, or 2.7V at  $25^{\circ}C$  and are for design guidance only.

a. A maximum of 36 x 50,000 block endurance cycles is allowed. This may be balanced between operations on 36x1 blocks of 50,000 maximum cycles each, 36x2 blocks of 25,000 maximum cycles each, or 36x4 blocks of 12,500 maximum cycles each (to limit the total number of cycles to 36x50,000 and that no single block ever sees more than 50,000 cycles).

## 2.4 AC Electrical Characteristics

## 2.4.1 AC Chip-Level Specifications

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and  $-40^{\circ}C \le T_A \le 85^{\circ}C$ , 3.0V to 3.6V and  $-40^{\circ}C \le T_A \le 85^{\circ}C$ , or 2.4V to 3.0V and  $-40^{\circ}C \le T_A \le 85^{\circ}C$ , respectively. Typical parameters apply to 5V, 3.3V, or 2.7V at  $25^{\circ}C$  and are for design guidance only.

a. A Fast-Mode I2C-bus device can be used in a Standard-Mode I2C-bus system, but the requirement t<sub>SU;DAT</sub> ≥ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t<sub>rmax</sub> + t<sub>SU;DAT</sub> = 1000 + 250 = 1250 ns (according to the Standard-Mode I2C-bus specification) before the SCL line is released.

# 3. Packaging Information

This chapter illustrates the packaging specifications for the CY8C20x34 PSoC device, along with the thermal impedances for each package.

**Important Note** Emulation tools may require a larger area on the target PCB than the chip's footprint. For a detailed description of the emulation tools' dimensions, refer to the document titled *PSoC Emulator Pod Dimensions* at <a href="http://www.cypress.com/design/MR10161">http://www.cypress.com/design/MR10161</a>.

## 3.1 Packaging Dimensions

Figure 3-1. 16-Lead (3x3 mm x 0.6 MAX) QFN -- Preliminary

Figure 3-2. 24-Lead (4x4 x 0.6 mm) QFN -- Preliminary

Figure 3-3. 32-Lead (5x5 mm 0.60 MAX) QFN

Figure 3-4. 48-Lead (7x7 mm) QFN

**Important Note** For information on the preferred dimensions for mounting QFN packages, see the following Application Note at <a href="http://www.amkor.com/products/notes\_papers/MLFAppNote.pdf">http://www.amkor.com/products/notes\_papers/MLFAppNote.pdf</a>.

# 3.2 Thermal Impedances

Table 3-1. Thermal Impedances per Package

| Package  | Typical $\theta_{JA}^{\ *}$ |
|----------|-----------------------------|
| 16 QFN** | 46 °C/W                     |
| 24 QFN** | 40 °C/W                     |
| 32 QFN** | 27 °C/W                     |
| 48 QFN** | 28 °C/W                     |

<sup>\*</sup>  $T_J = T_A + Power \times \theta_{JA}$ 

# 3.3 Solder Reflow Peak Temperature

Following is the minimum solder reflow peak temperature to achieve good solderability.

Table 3-2. Solder Reflow Peak Temperature

| Package | Minimum Peak Temperature* | Maximum Peak Temperature |
|---------|---------------------------|--------------------------|
| 16 QFN  | 240°C                     | 260°C                    |
| 24 QFN  | 240°C                     | 260°C                    |
| 32 QFN  | 240°C                     | 260°C                    |
| 48 QFN  | 240°C                     | 260°C                    |

<sup>\*</sup>Higher temperatures may be required based on the solder melting point. Typical temperatures for solder are  $220 \pm 5^{\circ}$ C with Sn-Pb or  $245 \pm 5^{\circ}$ C with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications.

 $<sup>^{\</sup>star\star}$  To achieve the thermal impedance specified for the  $^{\star\star}$  package, the center thermal pad should be soldered to the PCB ground plane.

# 4. Development Tool Selection

This chapter presents the development tools available for all current PSoC device families including the CY8C20x34 family.

#### 4.1 Software

## 4.1.1 PSoC Designer™

At the core of the PSoC development software suite is PSoC Designer. Utilized by thousands of PSoC developers, this robust software has been facilitating PSoC designs for half a decade. PSoC Designer is available free of charge at http://www.cypress.com under DESIGN RESOURCES >> Software and Drivers.

## 4.1.2 PSoC Express™

As the newest addition to the PSoC development software suite, PSoC Express is the first visual embedded system design tool that allows a user to create an entire PSoC project and generate a schematic, BOM, and data sheet without writing a single line of code. Users work directly with application objects such as LEDs, switches, sensors, and fans. PSoC Express is available free of charge at <a href="http://www.cypress.com/psocex-press.">http://www.cypress.com/psocex-press.</a>

## 4.1.3 PSoC Programmer

Flexible enough to be used on the bench in development, yet suitable for factory programming, PSoC Programmer works either as a standalone programming application or it can operate directly from PSoC Designer or PSoC Express. PSoC Programmer software is compatible with both PSoC ICE-Cube In-Circuit Emulator and PSoC MiniProg. PSoC programmer is available free ofcharge at <a href="http://www.cypress.com/psocprogrammer">http://www.cypress.com/psocprogrammer</a>.

### 4.1.4 CY3202-C iMAGEcraft C Compiler

CY3202 is the optional upgrade to PSoC Designer that enables the iMAGEcraft C compiler. It can be purchased from the Cypress Online Store. At <a href="http://www.cypress.com">http://www.cypress.com</a>, click the Online Store shopping cart icon at the bottom of the web page, and click *PSoC (Programmable System-on-Chip)* to view a current list of available items..

## 4.2 Development Kits

All development kits can be purchased from the Cypress Online Store.

#### 4.2.1 CY3215-DK Basic Development Kit

The CY3215-DK is for prototyping and development with PSoC Designer. This kit supports in-circuit emulation and the software interface allows users to run, halt, and single step the processor and view the content of specific memory locations. Advance emulation features also supported through PSoC Designer. The kit includes:

- PSoC Designer Software CD
- ICE-Cube In-Circuit Emulator
- ICE Flex-Pod for CY8C29x66 Family
- Cat-5 Adapter
- Mini-Eval Programming Board
- 110 ~ 240V Power Supply, Euro-Plug Adapter
- iMAGEcraft C Compiler (Registration Required)
- ISSP Cable
- USB 2.0 Cable and Blue Cat-5 Cable
- 2 CY8C29466-24PXI 28-PDIP Chip Samples

# 4.2.2 CY3210-ExpressDK PSoC Express Development Kit

The CY3210-ExpressDK is for advanced prototyping and development with PSoC Express (may be used with ICE-Cube In-Circuit Emulator). It provides access to I<sup>2</sup>C buses, voltage reference, switches, upgradeable modules and more. The kit includes:

- PSoC Express Software CD
- **Express Development Board**
- 4 Fan Modules
- 2 Proto Modules
- MiniProg In-System Serial Programmer
- MiniEval PCB Evaluation Board
- Jumper Wire Kit
- USB 2.0 Cable
- Serial Cable (DB9)
- 110 ~ 240V Power Supply, Euro-Plug Adapter
- 2 CY8C24423A-24PXI 28-PDIP Chip Samples
- 2 CY8C27443-24PXI 28-PDIP Chip Samples
- 2 CY8C29466-24PXI 28-PDIP Chip Samples

### 4.3 Evaluation Tools

All evaluation tools can be purchased from the Cypress Online Store.

#### 4.3.1 CY3210-MiniProg1

The CY3210-MiniProg1 kit allows a user to program PSoC devices via the MiniProg1 programming unit. The MiniProg is a small, compact prototyping programmer that connects to the PC via a provided USB 2.0 cable. The kit includes:

- MiniProg Programming Unit
- MiniEval Socket Programming and Evaluation Board
- 28-Pin CY8C29466-24PXI PDIP PSoC Device Sample
- 28-Pin CY8C27443-24PXI PDIP PSoC Device Sample
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

#### 4.3.2 CY3210-PSoCEval1

The CY3210-PSoCEval1 kit features an evaluation board and the MiniProg1 programming unit. The evaluation board includes an LCD module, potentiometer, LEDs, and plenty of breadboarding space to meet all of your evaluation needs. The kit includes:

- **■** Evaluation Board with LCD Module
- MiniProg Programming Unit
- 28-Pin CY8C29466-24PXI PDIP PSoC Device Sample (2)
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

#### 4.3.3 CY3214-PSoCEvalUSB

The CY3214-PSoCEvalUSB evaluation kit features a development board for the CY8C24794-24LFXI PSoC device. Special features of the board include both USB and capacitive sensing development and debugging support. This evaluation board also includes an LCD module, potentiometer, LEDs, an enunciator and plenty of bread boarding space to meet all of your evaluation needs. The kit includes:

- PSoCEvalUSB Board
- LCD Module
- MIniProg Programming Unit
- Mini USB Cable
- PSoC Designer and Example Projects CD
- Getting Started Guide
- Wire Pack

## 4.4 Device Programmers

All device programmers can be purchased from the Cypress Online Store.

## 4.4.1 CY3216 Modular Programmer

The CY3216 Modular Programmer kit features a modular programmer and the MiniProg1 programming unit. The modular programmer includes three programming module cards and supports multiple Cypress products. The kit includes:

- **Modular Programmer Base**
- 3 Programming Module Cards
- **■** MiniProg Programming Unit
- PSoC Designer Software CD
- **■** Getting Started Guide
- USB 2.0 Cable

# 4.4.2 CY3207ISSP In-System Serial Programmer (ISSP)

The CY3207ISSP is a production programmer. It includes protection circuitry and an industrial case that is more robust than the MiniProg in a production-programming environment.

**Note** CY3207ISSP needs special software and is not compatible with PSoC Programmer. The kit includes:

- CY3207 Programmer Unit
- PSoC ISSP Software CD
- 110 ~ 240V Power Supply, Euro-Plug Adapter
- USB 2.0 Cable

# 4.5 Accessories (Emulation and Programming)

- a. Flex-Pod kit includes a practice flex-pod and a practice PCB, in addition to two flex-pods.
- b. Foot kit includes surface mount feet that can be soldered to the target PCB.
- Programming adapter converts non-DIP package to DIP footprint. Specific details and ordering information for each of the adapters can be found at http://www.emulation.com.

# 4.6 3rd-Party Tools

Several tools have been specially designed by the following 3rd-party vendors to accompany PSoC devices during development and production. Specific details for each of these tools can be found at <a href="http://www.cypress.com">http://www.cypress.com</a> under DESIGN RESOURCES >> Evaluation Boards.

# 4.7 Build a PSoC Emulator into Your Board

For details on how to emulate your circuit before going to volume production using an on-chip debug (OCD) non-production PSoC device, see Application Note "Debugging - Build a PSoC Emulator into Your Board - AN2323" at http://www.cypress.com/design/AN2323.

# 5. Ordering Information

The following table lists the CY8C20234, CY8C20334 and CY8C20434 PSoC device's key package features and ordering codes.

Cypress Semiconductor does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress Semiconductor products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress Semiconductor against all charges. Cypress Semiconductor products are not warranted nor intended to be used for medical, life-support, life-saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress Semiconductor.

#### Flash Code Protection

Note the following details of the Flash code protection features on Cypress Semiconductor PSoC devices.

Cypress Semiconductor products meet the specifications contained in their particular data sheets. Cypress Semiconductor believes that its family of products is one of the most secure families of its kind on the market today, regardless of how they are used. There may be methods, unknown to Cypress Semiconductor, that can breach the code protection features. Any of these methods, to our knowledge, would be dishonest and possibly illegal. Neither Cypress Semiconductor nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Cypress Semiconductor is willing to work with the customer who is concerned about the integrity of their code. Code protection is constantly evolving. We at Cypress Semiconductor are committed to continuously improving the code protection features of our products.
