4 Test Setup

4.1 Test Equipment

Voltage Source:

The input voltage source, V_{IN} , should be a 0-V to 20-V variable DC source capable of supplying 10 A_{DC}. Connect V_{IN} to J1 as shown in [Figure 4-2](#).

Multimeters:

V1: V_{IN} at TP1 (V_{IN}) and TP10 (GND). V2: V_{OUT} at TP2 (V_{OUT}) and TP11 (GND). A1: V_{IN} input current

Output Load:

The output load should be an electronic constant resistance mode load capable of 0 A_{DC} to 16 A_{DC} at 1.5 V.

Oscilloscope:

A digital or analog oscilloscope can be used to measure the output ripple. The oscilloscope should be set for the following:

- 1-M Ω impedance
- 20-MHz bandwidth
- AC coupling
- 2- μ s/division horizontal resolution
- 20-mV/division vertical resolution

Test points TP2 and TP11 can be used to measure the output ripple voltage by placing the oscilloscope probe tip through TP2 and holding the ground barrel on TP11 as shown in [Figure 4-1](#). Using a leaded ground connection can induce additional noise due to the large ground loop.

Figure 4-1. Tip and Barrel Measurement for V_{OUT} Ripple

Recommended Wire Gauge:

1. V_{IN} to J1 (12-V input):
The recommended wire size is AWG #16 per input connection, with the total length of wire less than four feet (two feet input, two feet return).
2. J2 to LOAD:
The minimum recommended wire size is AWG #14, with the total length of wire less than four feet (two feet output, two feet return).

4.2 Recommended Test Setup

Figure 4-2. TPS53319EVM-136 Recommended Test Setup

Figure 4-2 is the recommended test setup to evaluate the TPS53319EVM-136. Working at an ESD workstation, make sure that any wrist straps, bootstraps, or mats are connected referencing the user to earth ground before power is applied to the EVM.

Input Connections:

1. Prior to connecting the DC input source V_{IN} , it is advisable to limit the source current from V_{IN} to 10-A maximum. Make sure V_{IN} is initially set to 0 V and connected as shown in Figure 4-2.
2. Connect a voltmeter V1 at TP1 (V_{IN}) and TP10 (GND) to measure the input voltage.
3. Connect a current meter A1 to measure the input current.

Output Connections

1. Connect the load to J2 and set the load to constant resistance mode to sink 0 A_{DC} before V_{IN} is applied.
2. Connect a voltmeter V2 at TP2 (V_{OUT}) and TP11 (GND) to measure the output voltage.

5 Configurations

All jumper selections should be made prior to applying power to the EVM. The user can configure this EVM per the following configurations.

6. Remove the jumper on J6 to enable the controller.
7. Use V2 to measure Vout voltage.
8. Vary Load from 0-14Adc, Vout should be remain in load regulation.
9. Vary Vin from 8V to 20V, Vout should remain in line regulation.
10. Put the jumper on J6 to disable the controller.
11. Decrease Load to 0A
12. Decrease Vin to 0V.

6.2 Control Loop Gain and Phase Measurement Procedure

TPS53319EVM-136 contains a 10Ω series resistor in the feedback loop for loop response analysis.

1. Set up EVM as described in [Section 4](#) and [Figure 4-2](#).
2. Connect isolation transformer to test points marked TP6 and TP7.
3. Connect input signal amplitude measurement probe (channel A) to TP6. Connect output signal amplitude measurement probe (channel B) to TP7.
4. Connect ground lead of channel A and channel B to TP9.
