Evaluating the ADE7880 Energy Metering IC

FEATURES

Evaluation board designed to be used with accompanying software to implement a fully functional 3-phase energy meter
Easy connection of external transducers via screw terminals
Easy modification of signal conditioning components using PCB sockets
LED indicators on the CF1, CF2, CF3, IRQ0, and IRQ1 logic outputs
Optically isolated metering components and USB-based communication with a PC
External voltage reference option available for on-chip reference evaluation
PC COM port-based firmware updates

GENERAL DESCRIPTION

The ADE7880 is a high accuracy, 3-phase electrical energy measurement IC with serial interfaces and three flexible pulse outputs. The ADE7880 device incorporates second-order sigma-delta (Σ-Δ) analog-to-digital converters (ADCs), a digital integrator, reference circuitry, and all of the signal processing required to perform the total (fundamental and harmonic) active and apparent energy measurements, rms calculations, and fundamental-only active and reactive energy measurements. In addition, the ADE7880 computes the rms of harmonics on the phase and neutral currents and on the phase voltages, together with the active, reactive, and apparent powers, the power factor and harmonic distortion on each harmonic for all phases. Total harmonic distortion (THD) is computed for all currents and voltages. This user guide describes the ADE7880 evaluation kit hardware, firmware, and software functionality. The evaluation board contains an ADE7880 and an LPC2368 microcontroller (from NXP Semiconductors). The ADE7880 and its associated metering components are optically isolated from the microcontroller. The microcontroller communicates with the PC using a USB interface.

The ADE7880 evaluation board and this user guide, together with the ADE7880 data sheet, provide a complete evaluation platform for the ADE7880.

The evaluation board has been designed so that the ADE7880 can be evaluated as an energy meter. Using appropriate current transducers, the evaluation board can be connected to a test bench or high voltage (240 V rms) test circuit. On-board resistor divider networks provide the attenuation for the line voltages. This user guide describes how the current transducers should be connected for the best performance. The evaluation board requires two power supplies, one external supply of 3.3 V and one supply provided by connecting a USB cable between a PC and the board. Appropriate current transducers are also required.

REVISION HISTORY

2/12—Revision 0: Initial Version

EVALUATION BOARD CONNECTION DIAGRAM

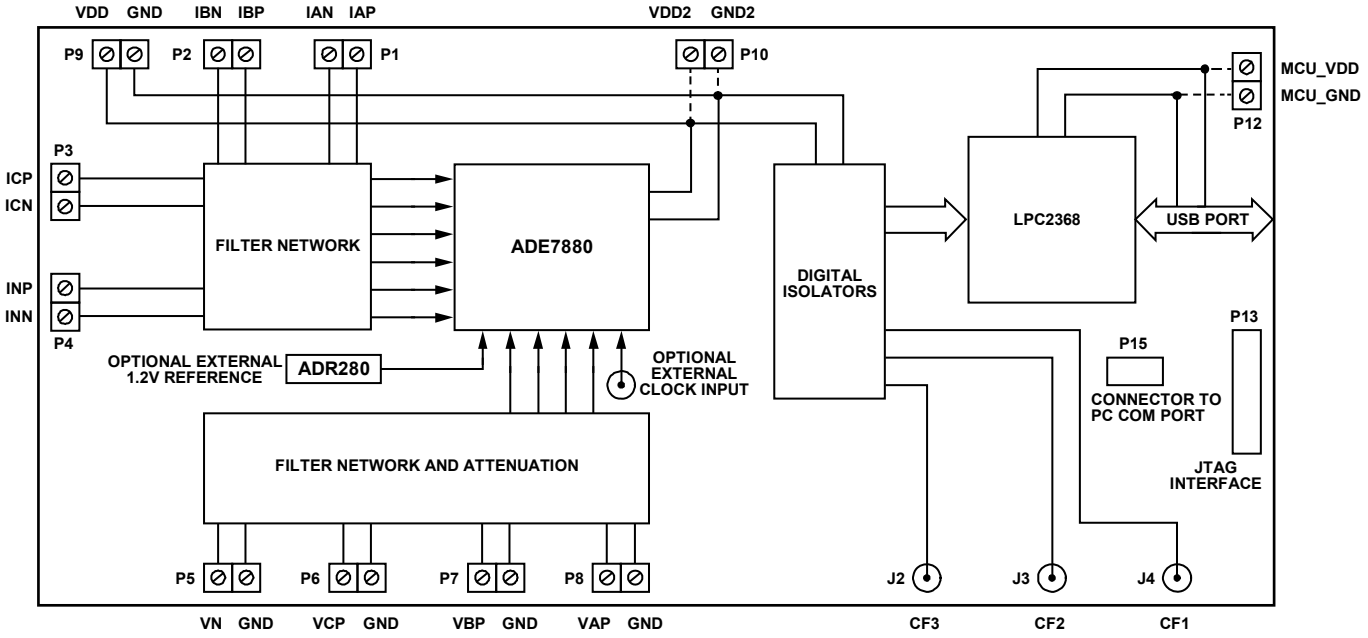

Figure 1.

EVALUATION BOARD HARDWARE

POWER SUPPLIES

The evaluation board has two power domains: one domain supplies the microcontroller and one side of the isocouplers and one domain supplies the other side of the isocouplers and the ADE7880. The ground of the microcontroller's power domain is connected to the ground of the PC through the USB cable. The ground of the ADE7880 power domain is determined by the ground of the phase voltages, VAP, VBP, VCP, and VN, and must be different from the ground of the microcontroller's power domain.

The microcontroller 3.3 V supply is provided by the PC through the USB cable. Alternatively, if Jumper JP24 is connected between Pin 1 and Pin 2, the 3.3 V supply can be provided at the P12 connector. The ADE7880 3.3 V supply is provided at the P9 connector. Ensure that Jumper JP11 is connected between Pin 1 and Pin 2 to ensure the same 3.3 V supply from the ADE7880 is also provided at the isocouplers.

ANALOG INPUTS (P1 TO P4 AND P5 TO P8)

Current and voltage signals are connected at the screw terminals, P1 to P4 and P5 to P8, respectively. All analog input signals are filtered using the on-board antialiasing filters before the signals are connected to the ADE7880. The components used on the board are the recommended values to be used with the ADE7880.

Current Sense Inputs (P1, P2, P3, and P4)

The ADE7880 measures three phase currents and the neutral current. Current transformers or Rogowski coils can be used to sense the currents. These sensors cannot be mixed together for the phase currents sensing, but the neutral current may be sensed using a different sensor. The ADE7880 contains different internal PGA gains on phase currents and on the neutral current; therefore, sensors with different ratios can be used. The only requirement is to have the same scale signals at the PGA outputs; otherwise, the mismatch functionality of the ADE7880 is compromised (see the ADE7880 data sheet for more details about neutral current mismatch). Figure 2 shows the structure used for the Phase A current; the sensor outputs are connected to the P1 connector.

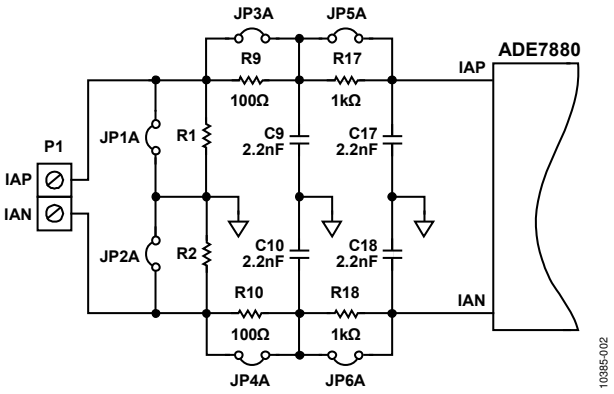

Figure 2. Phase A Current Input Structure on the Evaluation Board

The R1 and R2 resistors are the burden resistors and, by default, they are not populated. They can also be disabled using the JP1A and JP2A jumpers. The R9/C9 and R10/C10 RC networks are used in conjunction with Rogowski coils. They can be disabled using the JP3A and JP4A jumpers. The R17/C17 and R18/C18 RC networks are the antialiasing filters. The default corner frequency of these low-pass filters is 72 kHz (1 kΩ/2.2 nF). These filters can easily be adjusted by replacing the components on the evaluation board.

All the other current channels (that is, Phase B, Phase C, and the neutral current) have an identical input structure.

Using a Current Transformer as the Current Sensor

Figure 3 shows how a current transformer can be used as a current sensor in one phase of a 3-phase, 4-wire distribution system (Phase A). The other two phases and the neutral current require similar connections.

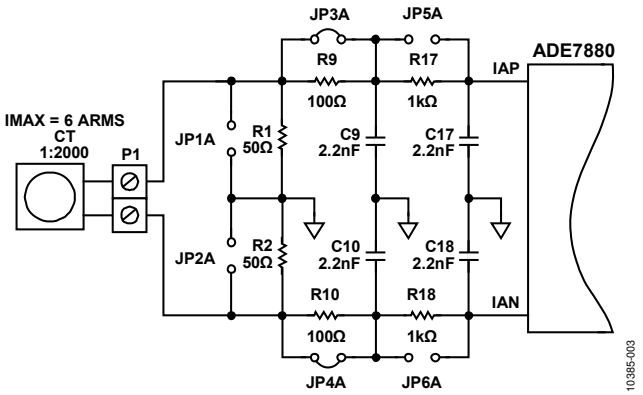

Figure 3. Example of a Current Transformer Connection

The R1 and R2 burden resistors must be defined as functions of the current transformer ratio and the maximum current of the system, using the following formula:

$$R1 = R2 = 1/2 \times 0.5/\sqrt{2} \times N/I_{FS}$$

where:
$0.5/\sqrt{2}$ is the rms value of the full-scale voltage accepted at the ADC input.
N is the input-to-output ratio of the current transformer. Figure 3 shows an example for N = 2000.
I_{FS} is the maximum rms current to be measured.

The JP1A and JP2A jumpers should be opened if R1 and R2 are used. The antialiasing filters should be enabled by opening the J5A and J6A jumpers (see Figure 3).

The secondary current of the transformer is converted to a voltage by using a burden resistor across the secondary winding outputs. Care should be taken when using a current transformer as the current sensor. If the secondary is left open (that is, no burden is connected), a large voltage may be present at the secondary outputs. This can cause an electric shock hazard and potentially damage electronic components.

For this particular example, burden resistors of 50 Ω signify an input current of 7.05 A rms at the ADE7880 ADC full-scale input (0.5 V). In addition, the PGA gains for the current channel must be set at 1. For more information about setting PGA gains, see the ADE7880 data sheet. The evaluation software allows the user to configure the current channel gain.

Using a Rogowski Coil as the Current Sensor

Figure 4 shows how a Rogowski coil can be used as a current sensor in one phase of a 3-phase, 4-wire distribution system (Phase A). The other two phases and the neutral current require identical connections. The Rogowski coil does not require any burden resistors; therefore, R1 and R2 should not be populated. The antialiasing filters should be enabled by opening the JP5A and JP6A jumpers. To account for the high frequency noise introduced by the coil, an additional antialiasing filter must be introduced by opening the JP3A and JP4A jumpers. Then, to compensate for the 20 dB/dec gain introduced by the di/dt sensor, the integrator of the ADE7880 must be enabled by setting Bit 0 (INTEN) of the CONFIG register. The integrator has a −20 dB/dec attenuation and a phase shift of approximately −90° and, when combined with the di/dt sensor, results in a magnitude and phase response with a flat gain over the frequency band of interest.

Voltage Sense Inputs (P5, P6, P7, and P8 Connectors)

The voltage input connections on the ADE7880 evaluation board can be directly connected to the line voltage sources. The line voltages are attenuated using a simple resistor divider network before they are supplied to the ADE7880. The attenuation network on the voltage channels is designed so that the 3 dB corner frequency of the network matches that of the antialiasing filters in the current channel inputs. This prevents the occurrence of large energy errors at low power factors.

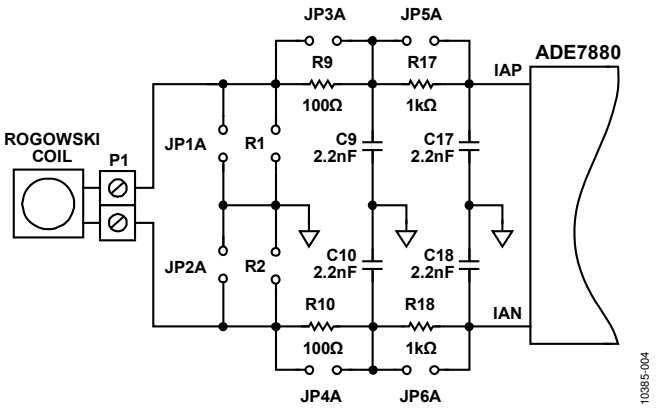

Figure 4. Example of a Rogowski Coil Connection

Figure 5 shows a typical connection of the Phase A voltage inputs; the resistor divider is enabled by opening the JP7A jumper, closing JP9A and connecting JP8A to AGND (Pin 1). The antialiasing filter on the VN data path is enabled by opening the JP7N jumper. The VN analog input is connected to AGND via the R25/C25 antialiasing filter using the P5 connector.

The attenuation networks can be easily modified by the user to accommodate any input level. However, the value of R32 (1 kΩ), should be modified only together with the corresponding resistors in the current channel (R17 and R18 on the Phase A current data path).

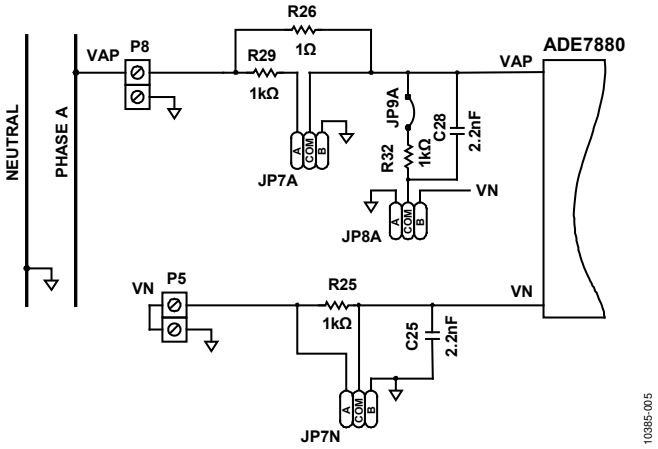

Figure 5. Phase A Voltage Input Structure on the Evaluation Board

The maximum signal level permissible at the VAP, VBP, and VCP pins of the ADE7880 is 0.5 V peak. Although the ADE7880 analog inputs can withstand ±2 V without risk of permanent damage, the signal range should not exceed ±0.5 V with respect to AGND for a specified operation.

Table 1. Recommended Settings for Evaluation Board Connectors

Jumper	Option	Description
JP1A	Closed	Connects Pin 1 of the Channel IA pin connector, P1, to AGND. Use this configuration in conjunction with JP3A and JP5A to short the IAP pin of the ADE7880 to AGND.
	Open (default)	Pin 1 of the Channel IA pin connector, P1, is left floating. Use this configuration in normal operation to drive IAP with analog signal.
JP1B	Closed	Connects Pin 1 of the Channel IB pin connector, P2, to AGND. Use this configuration in conjunction with JP3B and JP5B to short the IBP pin of the ADE7880 to AGND.
	Open (default)	Pin 1 of the Channel IB pin connector, P2, is left floating. Use this configuration in normal operation to drive IBP with analog signal.
JP1C	Closed	Connects Pin 1 of the Channel IC pin connector, P3, to AGND. Use this configuration in conjunction with JP3C and JP5C to short the ICP pin of the ADE7880 to AGND.
	Open (default)	Pin 1 of the Channel IC pin connector, P3, is left floating. Use this configuration in normal operation to drive ICP with analog signal.
JP1N	Closed	Connects Pin 1 of the Channel IN pin connector, P4, to AGND. Use this configuration in conjunction with JP3N and JP5N to short the INP pin of the ADE7880 to AGND.
	Open (default)	Pin 1 of the Channel IN pin connector, P4, is left floating. Use this configuration in normal operation to drive INP with analog signal.
JP2A	Closed	Connects Pin 2 of the Channel IA pin connector, P1, to AGND. Use this configuration in conjunction with JP4A and JP6A to short the IAN pin of the ADE7880 to AGND.
	Open (default)	Pin 2 of the Channel IA pin connector, P1, is left floating. Use this configuration in normal operation when driving a differential input to IAN.
JP2B	Closed	Connects Pin 2 of the Channel IB pin connector, P2, to AGND. Use this configuration in conjunction with JP4B and JP6B to short the IBN pin of the ADE7880 to AGND.
	Open (default)	Pin 2 of the Channel IB pin connector, P2, is left floating. Use this configuration in normal operation when driving a differential input to IBN.
JP2C	Closed	Connects Pin 2 of the Channel IC pin connector, P3, to AGND. Use this configuration in conjunction with JP4C and JP6C to short the ICN pin of the ADE7880 to AGND.
	Open (default)	Pin 2 of the Channel IC pin connector, P3, is left floating. Use this configuration in normal operation when driving a differential input to ICN.
JP2N	Closed	Connects Pin 2 of the Channel IN pin connector, P4, to AGND. Use this configuration in conjunction with JP4N and JP6N to short the INN pin of the ADE7880 to AGND.
	Open (default)	Pin 2 of the Channel IBN pin connector, P2, is left floating. Use this configuration in normal operation when driving a differential input to IBN.
JP3A	Closed (default)	Disables the phase compensation network (composed by R9 and C9) in the IAP data path.
	Open	Enables the phase compensation network (composed by R9 and C9) in the IAP data path.
JP3B	Closed (default)	Disables the phase compensation network (composed by R11 and C11) in the IBP data path.
	Open	Enables the phase compensation network (composed by R11 and C11) in the IBP data path.
JP3C	Closed (default)	Disables the phase compensation network (composed by R13 and C13) in the ICP data path.
	Open	Enables the phase compensation network (composed by R13 and C13) in the ICP data path.
JP3N	Closed (default)	Disables the phase compensation network (composed by R15 and C15) in the INP data path.
	Open	Enables the phase compensation network (composed by R15 and C15) in the INP data path.
JP4A	Closed (default)	Disables the phase compensation network (composed by R10 and C10) in the IAN data path.
	Open	Enables the phase compensation network (composed by R10 and C10) in the IAN data path.
JP4B	Closed (default)	Disables the phase compensation network (composed by R12 and C12) in the IBN data path.
	Open	Enables the phase compensation network (composed by R12 and C12) in the IBN data path.
JP4C	Closed (default)	Disables the phase compensation network (composed by R14 and C14) in the ICN data path.
	Open	Enables the phase compensation network (composed by R14 and C14) in the ICN data path.
JP4N	Closed (default)	Disables the phase compensation network (composed by R16 and C16) in the INN data path.
	Open	Enables the phase compensation network (composed by R16 and C16) in the INN data path.
JP5A	Closed	Disables the phase antialiasing filter (composed by R17 and C17) in the IAP data path.
	Open (default)	Enables the phase antialiasing filter (composed by R17 and C17) in the IAP data path.
JP5B	Closed	Disables the phase antialiasing filter (composed by R19 and C19) in the IBP data path.
	Open (default)	Enables the phase antialiasing filter (composed by R19 and C19) in the IBP data path.

Jumper	Option	Description
JP5C	Closed	Disables the phase antialiasing filter (composed by R21 and C21) in the ICP data path.
	Open (default)	Enables the phase antialiasing filter (composed by R21 and C21) in the ICP data path.
JP5N	Closed	Disables the phase antialiasing filter (composed by R23 and C23) in the INP data path.
	Open (default)	Enables the phase antialiasing filter (composed by R23 and C23) in the INP data path.
JP6A	Closed	Disables the phase antialiasing filter (composed by R18 and C18) in the IAN data path.
	Open (default)	Enables the phase antialiasing filter (composed by R18 and C18) in the IAN data path.
JP6B	Closed	Disables the phase antialiasing filter (composed by R20 and C20) in the IBN data path.
	Open (default)	Enables the phase antialiasing filter (composed by R20 and C20) in the IBN data path.
JP6C	Closed	Disables the phase antialiasing filter (composed by R22 and C22) in the ICN data path.
	Open (default)	Enables the phase antialiasing filter (composed by R22 and C22) in the ICN data path.
JP6N	Closed	Disables the phase antialiasing filter (composed by R24 and C24) in the INN data path.
	Open (default)	Enables the phase antialiasing filter (composed by R24 and C24) in the INN data path.
JP7A	Closed between Pin 2 and Pin 1	Disables the resistor divider (composed by R26, R29, and R32) when JP9A is open. Use this configuration when using a low voltage signal source in the VAP data path.
	Closed between Pin 2 and Pin 3	Connects the VAP pin of the ADE7880 to AGND. Use this configuration when no signal source is desired in the VAP data path.
	Unconnected (default)	Enables the resistor divider (composed by R26, R29, and R32) when JP9A is closed. Use this configuration when using a high voltage signal source in the VAP data path in 3-phase, 4-wire and 3-phase 3-wire configurations.
JP7B	Closed between Pin 2 and Pin 1	Disables the resistor divider (composed by R27, R30, and R33) when JP9B is open. Use this configuration when using a low voltage signal source in the VBP data path.
	Closed between Pin 2 and Pin 3	Connects the VBP pin of the ADE7880 to AGND. Use this configuration when no signal source is desired in the VBP data path, such as 3-phase, 3-wire configuration.
	Unconnected (default)	Enables the resistor divider (composed by R27, R30, and R33) when JP9B is closed. Use this configuration when using a high voltage signal source in the VBP data path in 3-phase, 4-wire configuration.
JP7C	Closed between Pin 2 and Pin 1	Disables the resistor divider (composed by R28, R31, and R34) when JP9C is open. Use this configuration when using a low voltage signal source in the VCP data path.
	Closed between Pin 2 and Pin 3	Connects the VCP pin of the ADE7880 to AGND. Use this configuration when no signal source is desired in the VCP data path.
	Unconnected (default)	Enables the resistor divider (composed by R28, R31, and R34) when JP9C is closed. Use this configuration when using a high voltage signal source in the VCP data path in 3-phase 4-wire and 3-phase, 3-wire configurations.
JP7N	Closed between Pin 2 and Pin 1	Disables the antialiasing filter (composed by R25 and C25) in the VN data path. Use this configuration when normal single ended signals are connected to the ADE7880 voltage channels.
	Closed between Pin 2 and Pin 3	Connects the VN pin of the ADE7880 to AGND. Use this configuration when the ADE7880 voltage channels are connected to AGND.
	Unconnected (default)	Enables the antialiasing filter in the VN data path. Use this configuration when the ADE7880 voltage channels are differential, in 3-phase, 4-wire and 3-phase, 3-wire configurations.
JP8A	Soldered between Pin 2 and Pin 1 (default)	Connects C28 to AGND. Use this configuration when the ADE7880 voltage channels are differential, in 3-phase, 4-wire and 3-phase, 3-wire configurations.
	Soldered between Pin 2 and Pin 3	Connects C28 to VN. Use this configuration, with JP7N connected between Pin 2 and Pin 3, when the ADE7880 voltage channels are single-ended.
JP8B	Soldered between Pin 2 and Pin 1 (default)	Connects C27 to AGND. Use this configuration when the ADE7880 voltage channels are differential, in 3-phase, 4-wire and 3-phase, 3-wire configurations.
	Soldered between Pin 2 and Pin 3	Connects C27 to VN. Use this configuration, with JP7N connected between Pin 2 and Pin 3, when the ADE7880 voltage channels are single-ended.
JP8C	Soldered between Pin 2 and Pin 1 (default)	Connects C25 to AGND. Use this configuration when ADE7880 voltage channels are differential, in 3-phase, 4-wire and 3-phase, 3-wire configurations.
	Soldered between Pin 2 and Pin 3	Connects C25 to VN. Use this configuration, with JP7N connected between Pin 2 and Pin 3, when the ADE7880 voltage channels are single-ended.

Jumper	Option	Description
JP9A	Closed (default)	Enables the resistor divider (composed by R26, R29, and R32) when JP7A is unconnected. Use this configuration when using a high voltage signal source in the VAP data path, in 3-phase, 4-wire and 3-phase, 3-wire configurations.
	Open	Disables the resistor divider (composed by R26, R29, and R32) when JP7A is closed between Pin 1 and Pin 2. Use this configuration when using a low voltage signal source in the VAP data path.
JP9B	Closed (default)	Enables the resistor divider (composed by R27, R30, and R33) when JP7B is unconnected. Use this configuration when using a high voltage signal source in the VBP data path in 3-phase, 4-wire and 3-phase, 3-wire configurations.
	Open	Disables the resistor divider (composed by R27, R30, and R33) when JP7B is closed between Pin 1 and Pin 2. Use this configuration when using a low voltage signal source in the VBP data path.
JP9C	Closed (default)	Enables the resistor divider (composed by R28, R31, and R34) when JP7C is unconnected. Use this configuration when using a high voltage signal source in the VCP data path in 3 phase, 4 wire and 3-phase, 3-wire configurations.
	Open	Disables the resistor divider (composed by R28, R31, and R34) when JP7C is closed between Pin 1 and Pin 2. Use this configuration when using a low voltage signal source in the VCP data path.
JP10	Soldered between Pin 2 and Pin 1 (default)	Connects the on-board 16.384 MHz crystal, Y1, to the CLKIN pin of the ADE7880. Use this configuration when Crystal Y1 is used as the clock source for the ADE7880.
	Soldered between Pin 2 and Pin 3	Disconnects the on-board 16.384 MHz crystal, Y1, from the CLKIN pin of the ADE7880. Use this configuration when an external clock is used. This clock can be connected to the EXT_CLKIN connector.
JP11	Closed between Pin 2 and Pin 1 (default)	Connects the supply of the secondary side of the isocouplers (VDD2) to VDD, the supply of the ADE7880.
	Closed between Pin 2 and Pin 3	Connects the supply of the secondary side of the isocouplers (VDD2) to a 3.3 V supply provided at the P10 connector.
JP12	Closed	Connects the ADR280 voltage reference to the $REF_{IN/OUT}$ pin of the ADE7880. Use this configuration when the ADE7880 is configured to use an external reference.
	Open (default)	Disconnects the ADR280 voltage reference from the $REF_{IN/OUT}$ pin of the ADE7880. Use this configuration in normal operation when the ADE7880 is configured to use the internal reference.
JP21	Closed	Signals the NXP LPC2368 microcontroller to declare all I/O pins as outputs. Use this configuration when another microcontroller manages the ADE7880 through the P17 socket.
	Open (default)	Disables the option to use another microcontroller to manage the ADE7880 through the P17 socket. Use this configuration in normal operation to allow the NXP LPC2368 microcontroller to manage the ADE7880.
JP24	Closed between Pin 2 and Pin 1	Selects an external 3.3 V power supply provided at P12 connector to power the domain that includes the NXP LPC2368 and one side of the isocouplers. Use this configuration if USB provided power supply is not desired.
	Closed between Pin 2 and Pin 3 (default)	Selects the USB provided power supply to power the domain that includes the NXP LPC2368 and one side of the isocouplers. Use this configuration in normal operation to provide power to the NXP LPC2368 and one side of the isocouplers from the PC.
JP31, JP32, JP33, JP34	Closed between Pin 2 and Pin 1	When I^2C communication between the NXP LPC2368 and the ADE7880 is used, the HSDC port of the ADE7880 is also enabled and the SPI port of the ADE7880 is disabled. Use this configuration when I^2C communication is selected.
	Closed between Pin 2 and Pin 3 (default)	When SPI communication between the NXP LPC2368 and the ADE7880 is used, the I^2C and HSDC ports of the ADE7880 are disabled. Use this configuration when SPI communication is selected.

SETTING UP THE EVALUATION BOARD AS AN ENERGY METER

Figure 6 shows a typical setup for the ADE7880 evaluation board. In this example, an energy meter for a 3-phase, 4-wire, wye distribution system is shown. Current transformers are used to sense the phase and neutral currents and are connected as shown in Figure 6. The line voltages are connected directly to the evaluation board as shown. Note that the state of all jumpers must match the states shown in Figure 6, equal to the default states in Table 1. The board is supplied from two different power supplies. One is supplied by the PC through the USB cable and is used for the NXP LPC2368 and one side of the isocouplers. The other is an external 3.3 V supply used for the ADE7880 domain and the other side of the isocouplers. Because the two domains are isolated to ensure that there is no electrical connection between the high voltage test circuit and the control circuit, the external power supply should have floating voltage outputs.

Figure 7 shows a setup for the ADE7880 evaluation board as an energy meter for a 3-phase, 3-wire, delta distribution system. The Phase B voltage is used as a reference, and the VN pin of the ADE7880 is connected to it.

The evaluation board is connected to the PC using a USB cable supplied with the board. When the evaluation board is connected to the PC, the enumeration process begins. The PC recognizes new hardware and asks to install the appropriate driver. The driver can be found in the VirCOM_Driver_XP folder on the CD for a Windows XP PC or in the VirCom_Driver_W7_64bit for a Windows 7 64-bit PC. After the driver is installed, the supplied evaluation software can be started. The Evaluation Board Software section describes the ADE7880 evaluation software in detail and how it can be installed and uninstalled.

Activating Serial Communication Between the ADE7880 and the NXP LPC2368

The ADE7880 evaluation board provides communication between the ADE7880 and the NXP LPC2368 that is set through the SPI ports. The JP31, JP32, JP33, and JP34 jumpers are closed between Pin 2 and Pin 3. The SPI port should be chosen as the active port in the ADE7880 control panel.

Communication between the ADE7880 and the NXP LPC2368 is also possible using the I²C ports. To accomplish this, the JP31, JP32, JP33, and JP34 jumpers should be closed between Pin 2 and Pin 1. In this case, the I²C port should be chosen as the active port in the ADE7880 control panel (see Table 2). Note that the HSDC port of the ADE7880 also becomes available to communicate with the NXP LPC2368 in this case.

Table 2. Jumper State to Activate SPI or I²C Communication

Active Communication	Jumpers JP31, JP32, JP33, JP34
SPI (Default)	Closed between Pin 2 and Pin 3
I²C	Closed between Pin 2 and Pin 1

Using the Evaluation Board with Another Microcontroller

It is possible to manage the ADE7880 mounted on the evaluation board with a different microcontroller mounted on another board. The ADE7880 can be connected to this second board through one of two connectors: P11 or P17. P11 is placed on the same power domain as the ADE7880. P17 is placed on the power domain of the NXP LPC2368 and communicates with the ADE7880 through the isocouplers. If P11 is used, the USB cable should not be connected between the PC and the board to avoid supplying the power domain of the NXP LPC2368. If P17 is used, a conflict may arise with the NXP LPC2368 I/O ports.

To avoid this conflict, close the JP21 jumper. This tells the NXP LPC2368 to set all of its I/O ports high to allow the other microcontroller to communicate with the ADE7880. After JP21 is closed, the S2 reset button should be pressed low to reset the NXP LPC2368. This is necessary because the state of JP21 is checked inside the NXP LPC2368 program only once after reset.

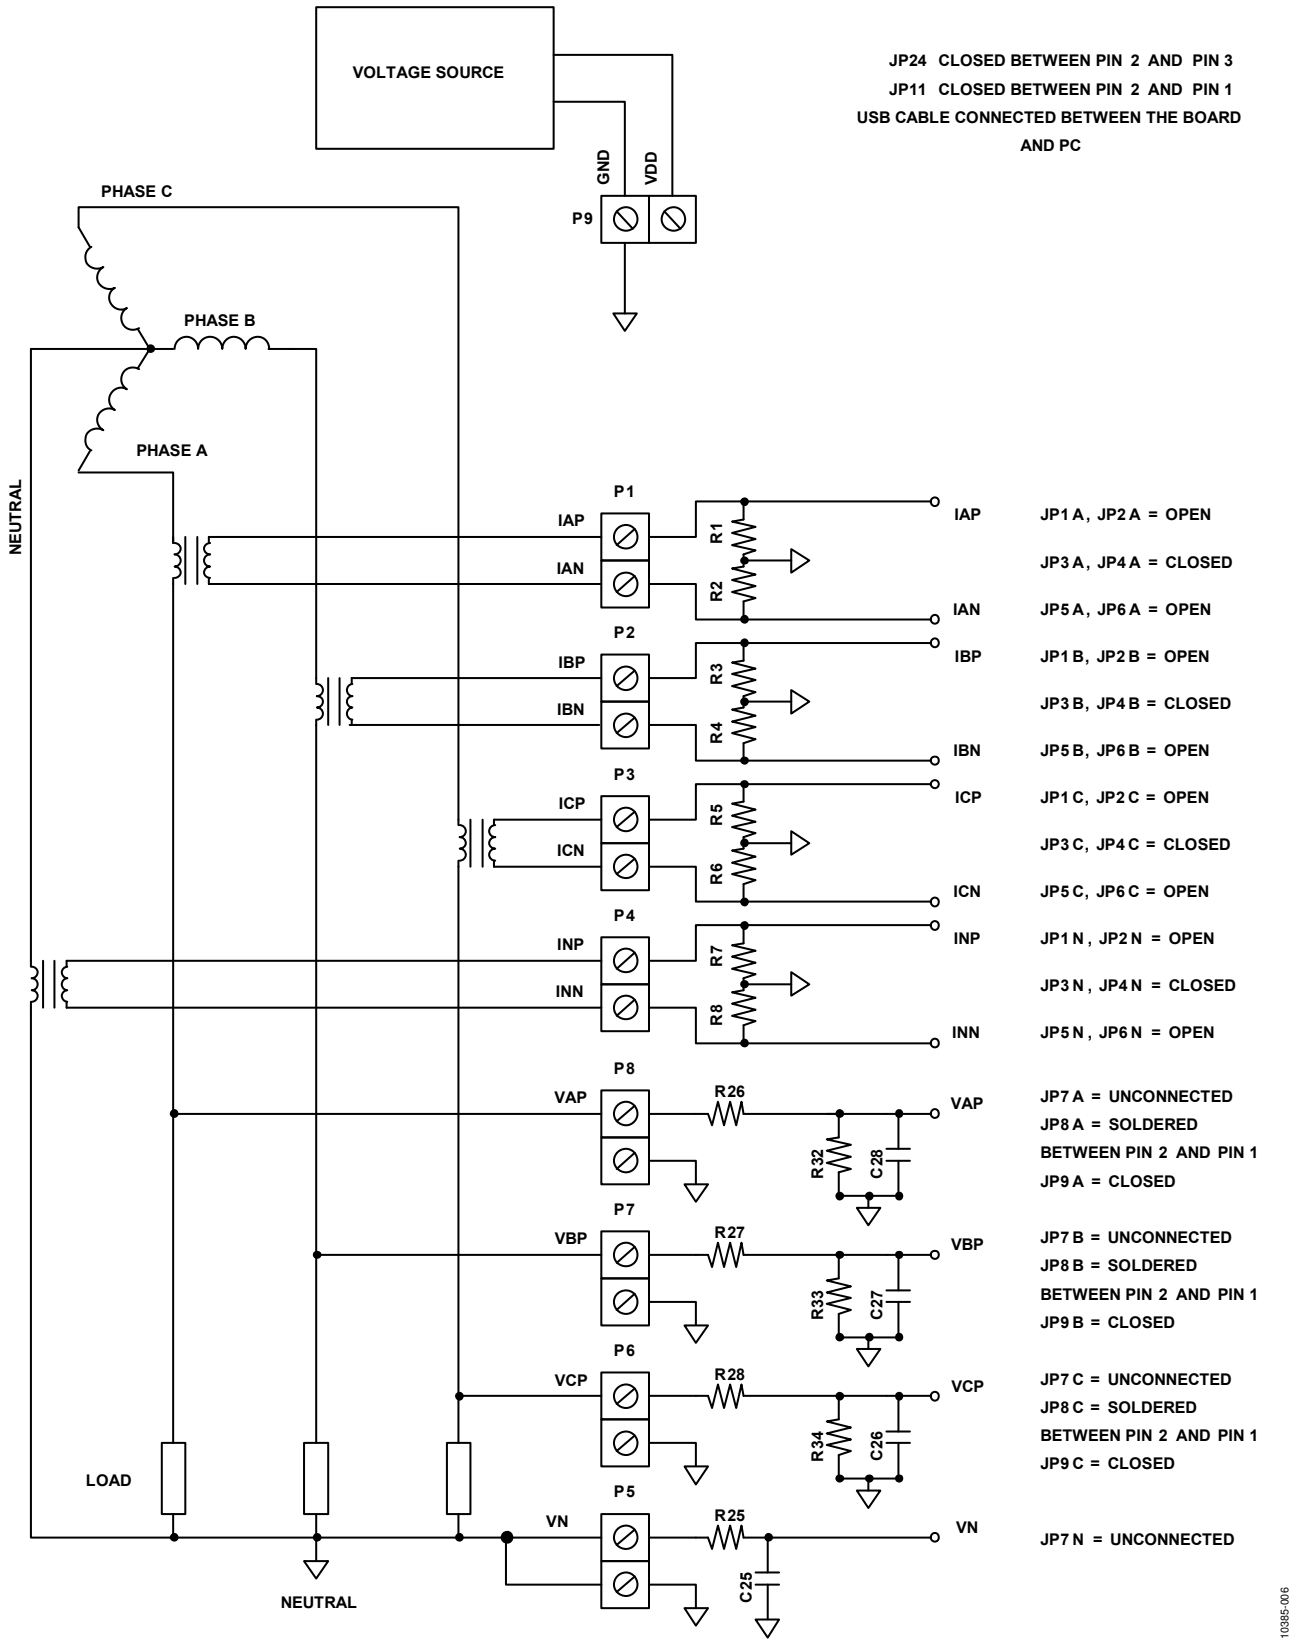

Figure 6. Typical Setup for the ADE7880 Evaluation Board for 3-Phase, 4-Wire, Wye Distribution Systems

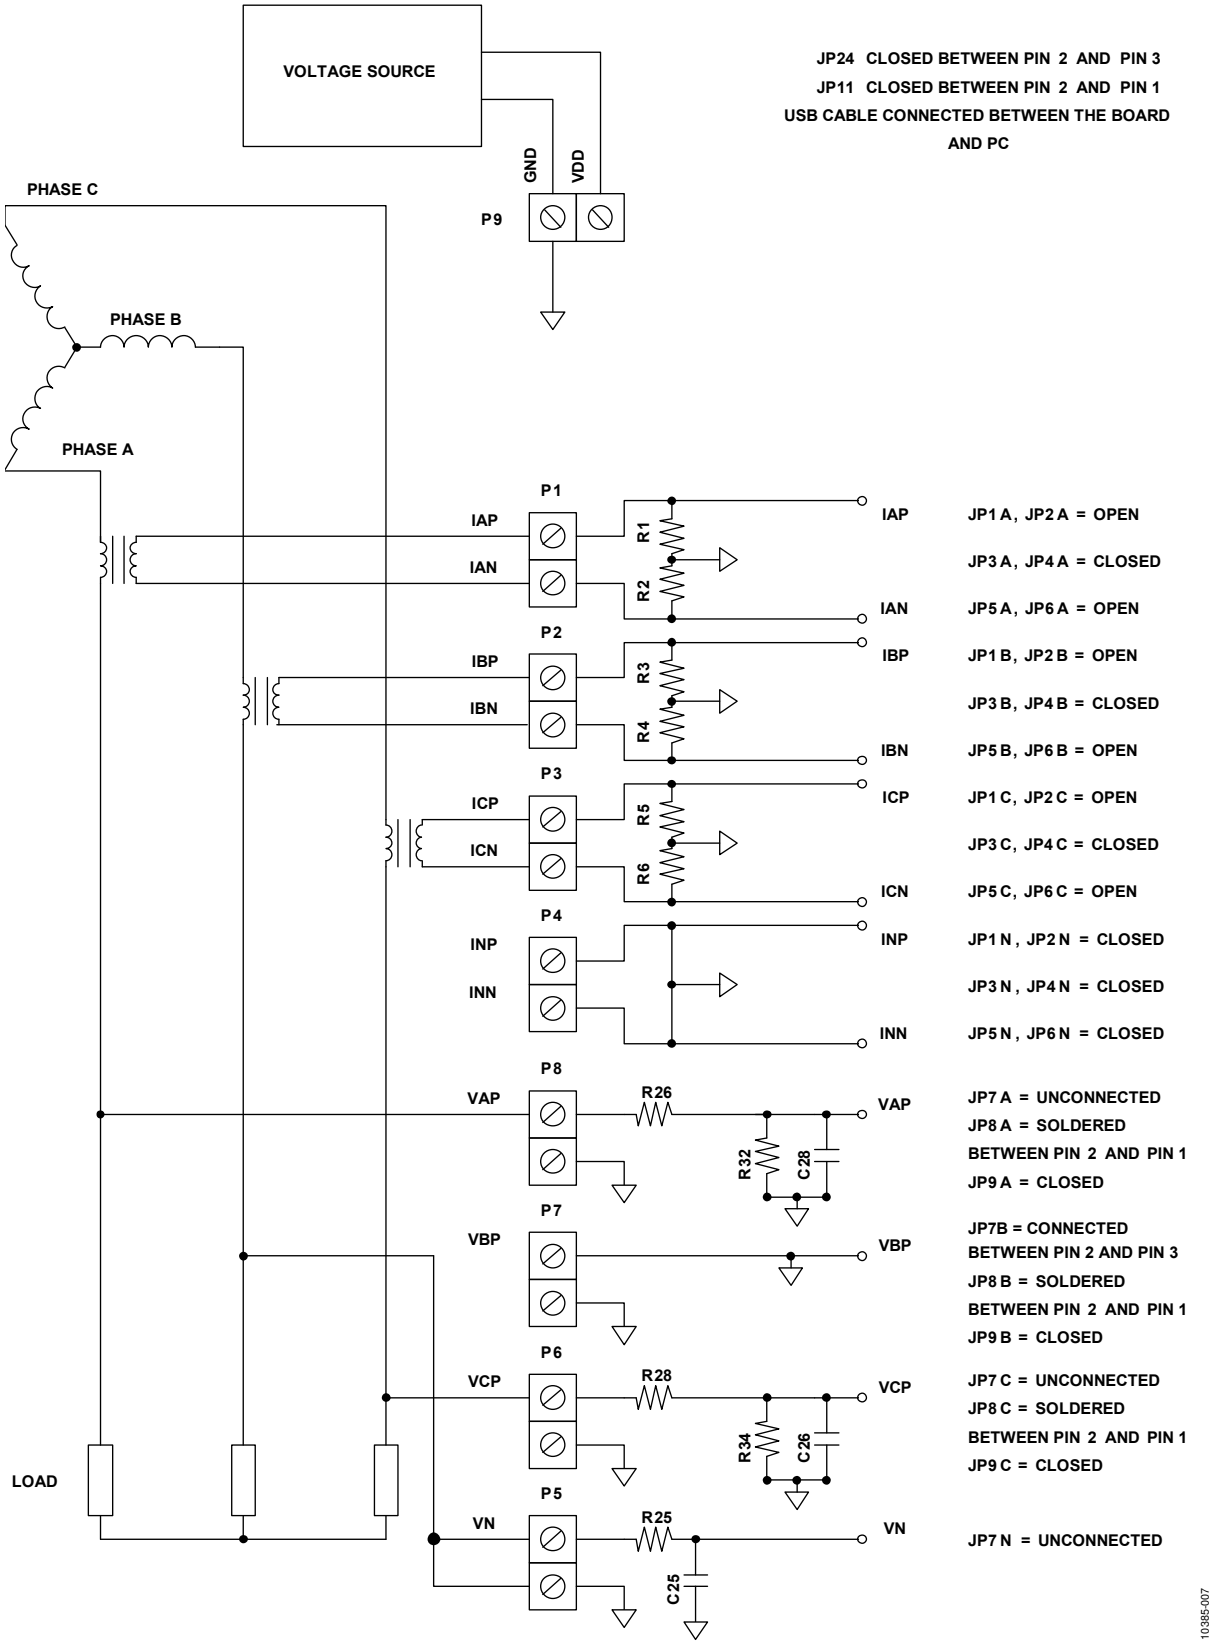

Figure 7. Typical Setup for the ADE7880 Evaluation Board for 3-Phase, 3-Wire, Delta Distribution Systems

EVALUATION BOARD SOFTWARE

The ADE7880 evaluation board is supported by Windows® based software that allows the user to access all the functionality of the ADE7880. The software communicates with the NXP LPC2368 microcontroller using the USB as a virtual COM port. The NXP LPC2368 communicates with the ADE7880 to process the requests that are sent from the PC.

INSTALLING AND UNINSTALLING THE ADE7880 SOFTWARE

The ADE7880 software is supplied on one CD-ROM. It contains two projects: one that represents the NXP LPC2368 project and one LabVIEW™ based program that runs on the PC. The NXP LPC2368 project is already loaded into the processor, but the LabVIEW based program must be installed.

1. To install the ADE7880 software, place the CD-ROM in the CD-ROM reader and double-click **LabView_project\installation_files\setup.exe**. This launches the setup program that automatically installs all the software components, including the uninstall program, and creates the required directories.
2. To launch the software, go to the **Start/Programs/ADE7880 Eval Software** menu and click **ADE7880 Eval Software**.

Both the ADE7880 evaluation software program and the LabVIEW run-time engine are easily uninstalled using the **Add/ Remove Programs** option in the **Control Panel**.

1. Before installing a new version of the ADE7880 evaluation software, first uninstall the previous version.
2. Select the **Add/Remove Programs** option in the Windows **Control Panel**.
3. Select the program to uninstall and click the **Add/Remove** button.

FRONT PANEL

When the evaluation board software is launched, the **Front Panel** is opened. This panel contains three areas: the main menu at the left, the sub-menu at the right, and a box that displays the name of the communication port used by the PC to connect to the evaluation port, also at the right (see Figure 8).

The COM port used to connect the PC to the evaluation board must be selected first. The program displays a list of the active COM ports, allowing you to select the correct part. To learn which COM port is used by the evaluation board, launch the Windows **Device Manager** (the **devmgmt.msc** file) in the **Run** window on the Windows **Start** menu. By default, the program offers the option of searching for the COM port.

The serial communication between the microcontroller and the ADE7880 is selected using a switch in the LabVIEW software. By default, the SPI port is used. Note that the active serial port must first be set in the hardware. See the Activating Serial Communication Between the ADE7880 and the NXP LPC2368 section for details on how to set it up.

The main menu has only one choice, other than **Exit**, enabled, **Find COM Port**. Clicking it starts a process in which the PC tries to connect to the evaluation board using the port indicated in the **Start** menu. It uses the echo function of the communication protocol (see the Managing the Communication Protocol Between the Microcontroller and the ADE7880 section). It displays the port that matches the protocol and then sets it to 115,200 baud, eight data bits, no parity, no flow control, one stop bit.

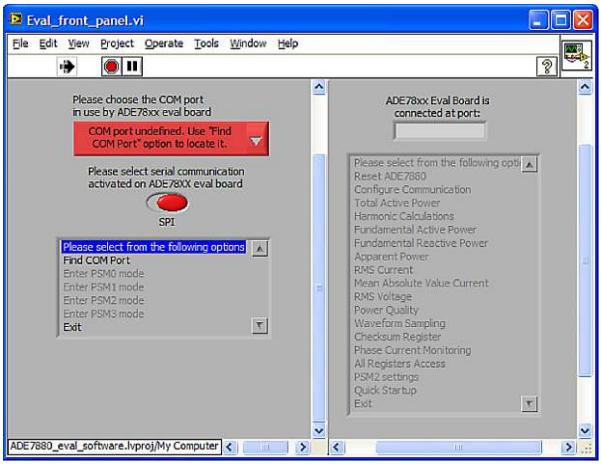

Figure 8. Front Panel of the ADE7880 Software

If the evaluation board is not connected, the port is displayed as **XXXXX**. In this case, the evaluation software is still accessible, but no communication can be established. Whether the search for the COM port is successful or not, the cursor is positioned at **Please select from the following options** in the main menu, **Find COM Port** is grayed out, and the other main menu options are enabled (see Figure 9). These options allow you to command the ADE7880 in either the PSM0 or PSM3 power mode. The other power modes, PSM1 and PSM2, are not available because they must be initialized in PSM0 before the ADE7880 can be used in PSM1 or PSM2.

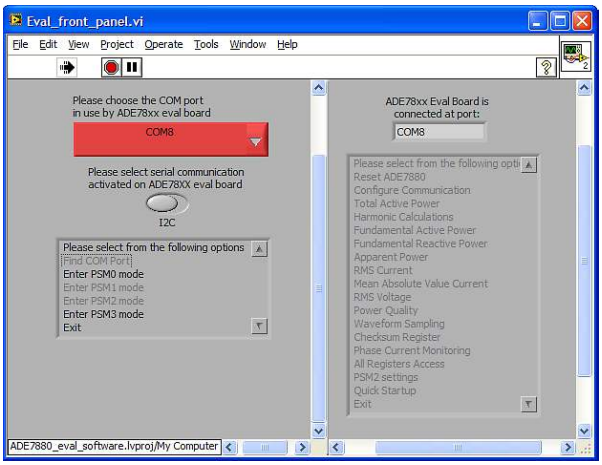

Figure 9. Front Panel After the COM Port Is Identified

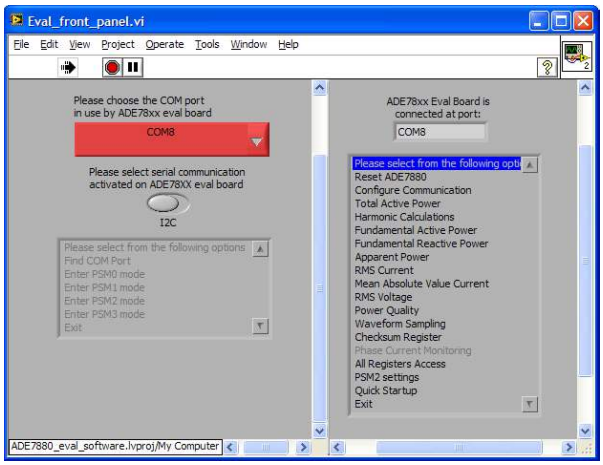

Figure 10. Front Panel After the ADE7880 Enters PSM0 Mode

PSM0 MODE—NORMAL POWER MODE

Enter PSM0 Mode

When the evaluation board is powered up, the ADE7880 is in PSM3 sleep mode. When **Enter PSM0 mode** is selected, the microcontroller activates the PM0 and PM1 pins of the ADE7880 to switch it into PSM0 mode. It waits 50 ms for the circuit to power up and, if SPI communication is activated on the board, it executes three SPI write operations to Address 0xEBFF of the ADE7880 to activate the SPI port.

If the operation is correctly executed or if I^2C communication is used, the message **Configuring LPC2368—ADE7880 communication was successful** is displayed, and you must click **OK** to continue. The only error that may occur during this operation is communication related; if this happens, the following message is displayed: **Configuring LPC2368—ADE7880 communication was not successful. Please check the communication between the PC and ADE7880 evaluation board and between LPC2368 and ADE7880**.

Bit 1 (I2C_LOCK) of the CONFIG2[7:0] register is now set to 1 to lock in the serial port choice. Then the DICOEFF register is initialized with 0xFFF8000, and the DSP of the ADE7880 is started when the software program writes **RUN = 0x1**. At the end of this process, the entire main menu is grayed out, and the submenu is enabled. You can now manage all functionality of the ADE7880 in PSM0 mode. To switch the ADE7880 to another power mode, click the **Exit** button on the submenu. The state of the **Front Panel** is shown in Figure 10.

Reset ADE7880

When **Reset ADE7880** is selected on the **Front Panel**, the $\overline{\text{RESET}}$ pin of the ADE7880 is kept low for 20 ms and then is set high. If the operation is correctly executed, the message, **ADE7880 was reset successfully**, is displayed, and you must click **OK** to continue. The only error that may occur during this operation is communication related; if this happens, the following message is displayed: **The communication between PC and ADE7880 evaluation board or between LPC2368 and ADE7880 did not function correctly. There is no guarantee the reset of ADE7880 has been performed.**

Configure Communication

When **Configure Communication** is selected on the **Front Panel**, the panel shown in Figure 11 is opened. This panel is useful if an ADE7880 reset has been performed and the SPI is no longer the active serial port. Select the SPI port by clicking the **I2C/SPI Selector** button and then click **OK** to update the selection and lock the port. If the port selection is successful, the following message is displayed: **Configuring LPC2368—ADE7880 communication was successful,** and you must click **OK** to continue. If a communication error occurs, the following message is displayed: **Configuring LPC2368—ADE7880 communication was not successful. Please check the communication between the PC and ADE7880 evaluation board**.

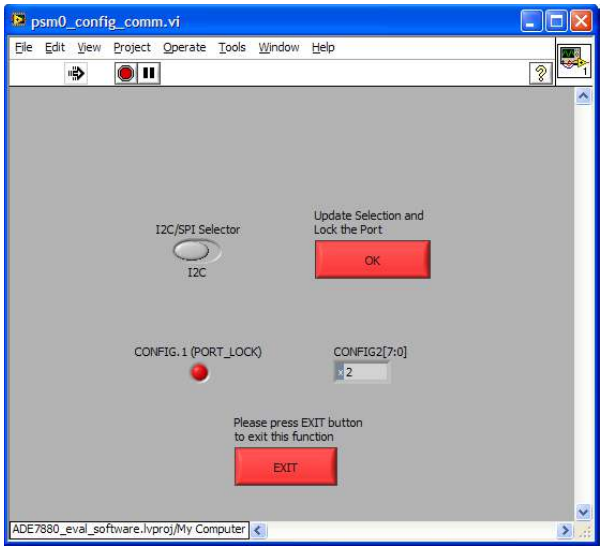

Figure 11. Configure Communication Panel

The CONFIG2[7:0] register is written with Bit 1 (I2C_LOCK) set to 1 so that you do not need to remember to set it once the communication is set. The contents of CONFIG2[7:0] are then read back and displayed with Bit 1 (I2C_LOCK).

To close the panel, click the **Exit** button; the cursor is positioned at **Please select from the following options** in the submenu of the **Front Panel**.

Total Active Power

When **Total Active Power** is selected on the **Front Panel**, the panel shown in Figure 12 is opened. The screen has an upper half and a lower half: the lower half shows the total active power data path of one phase, and the upper half shows bits, registers, and commands necessary for power management.

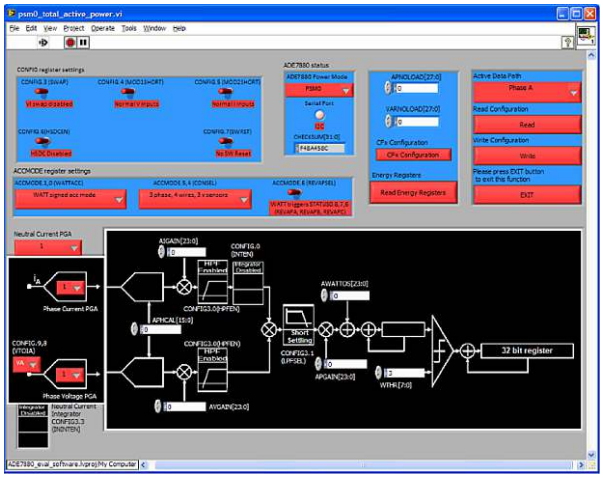

Figure 12. Total Active Power Panel

The **Active Data Path** menu manages which data path is shown in the bottom half. Some registers or bits, such as the WTHR[7:0] register or Bit 0 (INTEN) of the CONFIG[15:0] register, are common to all data paths, independent of the phase shown. When these registers are updated, all the values in all data paths are updated. Bit 0 (HPFEN) of the CONFIG3[7:0] register is included twice in the data path, but only the bit value from the current data path is written into the ADE7880. All the other instances take this value directly.

1. Click the **Read Configuration** button to read all ADE7880 registers that manage the total active power. Registers from the inactive data paths are also read and updated.
2. Click the **Write Configuration** button to write all registers that manage the total active power into the ADE7880. Registers from the inactive data paths are also written. The **ADE7880 status** box shows the power mode that the ADE7880 is in (it should always be PSM0 in this window), the active serial port, and the CHECKSUM[31:0] register. After every read and write operation, the CHECKSUM[31:0] register is read and displayed.
3. Click the **CFx Configuration** button to open a new panel (see Figure 13). This panel gives access to all bits and registers that configure the CF1, CF2, and CF3 outputs of the ADE7880. The **Read Setup** and **Write Setup** buttons update and display the CF1, CF2, and CF3 output values.

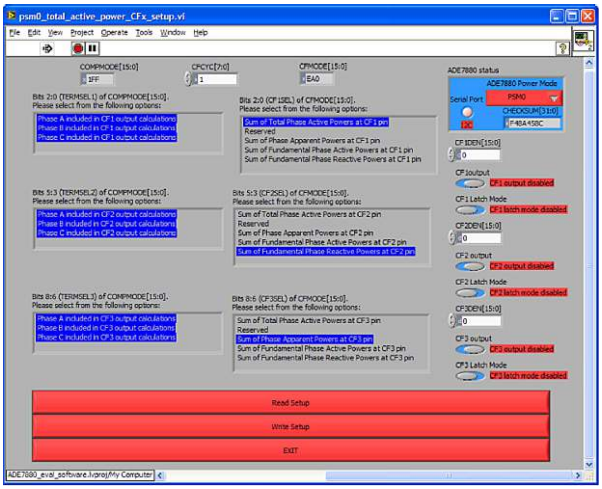

Figure 13. CFx Configuration Panel

Like the **Total Active Power** panel, the CHECKSUM[31:0] register is read back whenever a read or write operation is executed in the **CFx Configuration** panel. To select more than one option for a TERMSELx bit in the COMPMODE[15:0] register, press the **CTRL** key while clicking the options you want.

Clicking the **Exit** button closes the panel and redisplays the **Total Active Power** panel. When the **Read Energy Registers** button in the **Total Active Power** panel is clicked, a new panel is opened (see Figure 14). This panel gives access to bits and registers that configure the energy accumulation. The **Read Setup** and **Write Setup** buttons update and display the bit and register values. The CHECKSUM[31:0] register is read back whenever a read or write operation is executed in the **Read Energy Registers** panel. Click the **Read all energy registers** button to read all energy registers immediately, without regard to the modes in which they function.

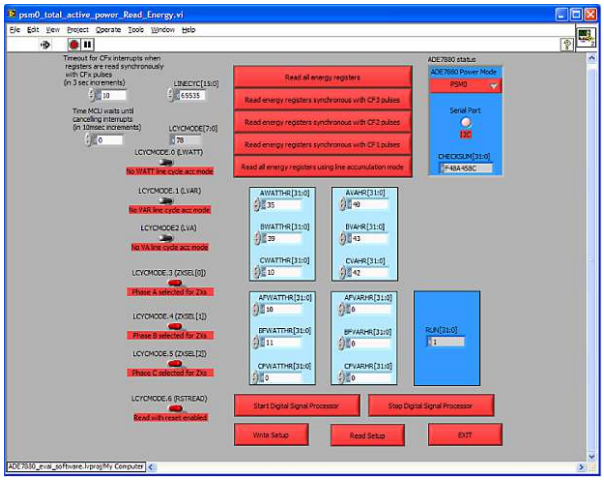

Figure 14. Read Energy Registers Panel

The panel also gives the choice of reading the energy registers synchronous to CFx interrupts (pulses) or using line cycle accumulation mode. When the **Read energy registers synchronous with CF1 pulses** button is clicked, the following occurs:

1. The STATUS0[31:0] register is read and then written back to so that all nonzero interrupt flag bits are cancelled.
2. Bit 14 (CF1) in the MASK0[31:0] register is set to 1, and the interrupt protocol is started (see the Managing the Communication Protocol Between the Microcontroller and the ADE7880 section for protocol details).
3. The microcontroller then waits until the $\overline{\text{IRQ0}}$ pin goes low. If the wait is longer than the timeout you indicate in 3 sec increments, the following error message is displayed: **No CF1 pulse was generated. Verify all the settings before attempting to read energy registers in this mode!**
4. When the $\overline{\text{IRQ0}}$ pin goes low, the STATUS0[31:0] register is read and written back to cancel Bit 14 (CF1); then the energy registers involved in the CF1 signal are read and their contents are displayed. A timer in 10 ms increments can be used to measure the reaction time after the $\overline{\text{IRQ0}}$ pin goes low.
5. The operation is repeated until the **Read energy registers synchronous with CF1 pulses** button is clicked again.

The process is similar when the other CF2, CF3, and line accumulation buttons are clicked in the **Read Energy Registers** panel.

It is recommended that a timeout always be used when dealing with interrupts. By default, the timeout is set to 10 (indicating a 30 sec timeout), and the timer is set to 0 (indicating that the STATUSx[31:0] and energy registers are read immediately after the $\overline{\text{IRQ0}}$ pin goes low).

When clicked on the **Front Panel**, the **Fundamental Active Power**, and **Fundamental Reactive Power** buttons open panels that are very similar to the **Total Active Power** panel. These panels are shown in Figure 15 and Figure 16.

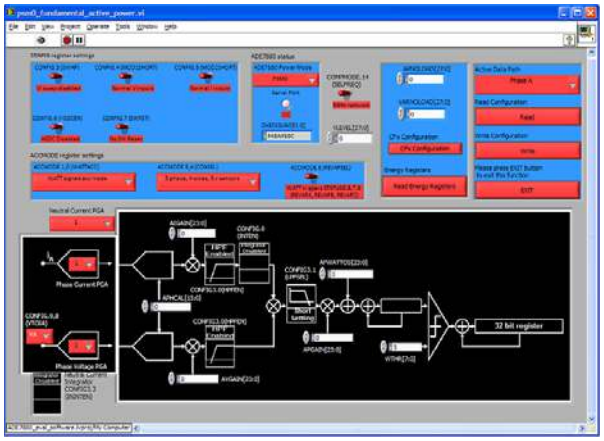

Figure 15. Fundamental Active Power Panel

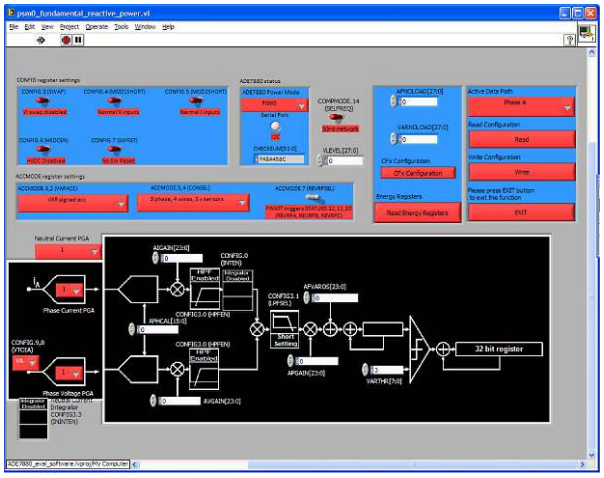

Figure 16. Fundamental Reactive Power Panel

Harmonic Calculations

When **Harmonic Calculations** is selected on the **Front Panel**, the panel shown in Figure 17 is opened. The panel is divided into two parts. The upper half provides status information, buttons to read and write registers related to the harmonic calculations, and the **Exit** button. The lower half contains harmonic calculations windows divided for each phase and neutral current.

The phase used as the time base for the harmonic calculations is selected by the button on the upper left side of the panel. Bits[9:8] (ACTPHSEL) in the HCONFIG register are managed through this button. The harmonic indexes status window indicates what phase is under analysis and what harmonic indexes have been set into HX, HY and HZ registers. The ADE7880 status window indicates the power mode of the ADE7880, the active serial port, and the last read CHECKSUM register value.

When the **Read** button is pressed, all the gain and offset registers that belong to the harmonic calculations are read together with all registers containing the harmonic calculations results. When the **Write** button is pressed, all the gain and offset registers that belong to the harmonic calculations are written into the ADE7880.

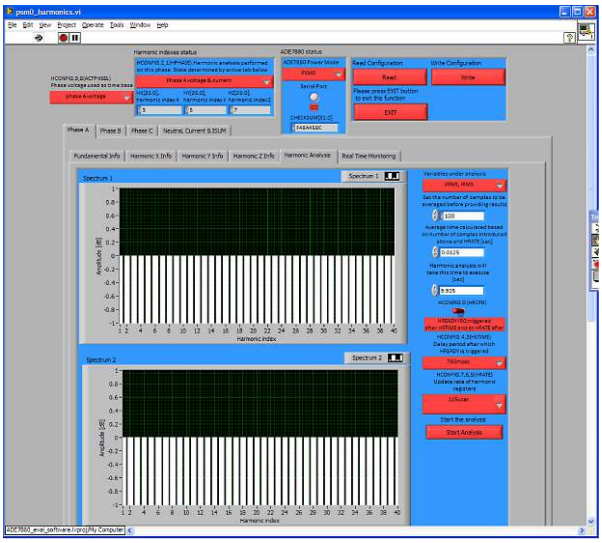

Figure 17. Harmonic Analysis Panel

Immediately after launch, the default panel is set to execute the harmonic analysis on Phase A. The user can select two quantities to analyze: current and voltage rms, active and reactive powers, apparent power and power factor, or current and voltage distortions. The program reads information starting with the fundamental and ending with Harmonic 63. Note that the pass-band frequency of the ADE7880 harmonic calculations is 2.8 kHz and any harmonic that is placed after that frequency is attenuated.

Next, the user can select how many samples are averaged before displaying the results. The default is 100 samples. The program automatically displays the average time it takes for the samples to be acquired based on HCONFIG register settings placed on the same panel: Bit 0 (HRCFG), Bits[4:3] (HSTIME), and Bits[7:5] (HRATE). When the **Start Analysis** button is pressed, the program instructs the ADE7880 to read all harmonic information, transfer it to the PC, and then displays it in dB relative to the acquired maximum harmonic value.

Every phase has separate panels in which information on one single harmonic or on the fundamental can be managed. Figure 18 shows the **Phase A Fundamental Info** panel. APGAIN, the Phase A power gain register, together with offset compensation registers AFWATTOS, AFVAROS, AFIRMSOS, and AFVRMSOS can be set in this panel and then, by pressing the **Write** button in the upper half part, the values can be written into the ADE7880. When the **Read** button is pressed, all the control registers together with the harmonic calculations results related to the panel (FWATT, FVAR, FIRMS, FVRMS, FVA, FPF, ITHDN, and VTHDN) are read and then displayed.

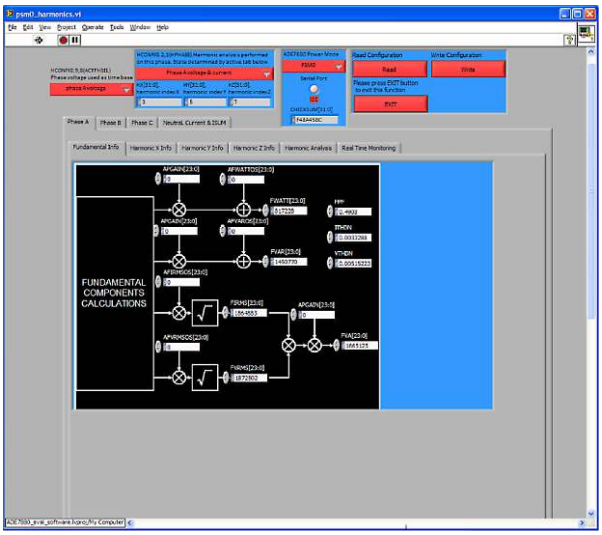

Figure 18. Phase A Fundamental Info Panel

Similarly, each phase and neutral have panels dedicated to the three harmonics that the ADE7880 can monitor at a time. The neutral line is analyzed together with the sum of the phase currents that the ADE7880 calculates into the ISUM register. In addition to the **Phase Fundamental info** panel, these panels contain options to select a harmonic index using one of the HX, HY or HZ registers. Type a number between 1 and 63 into the HX, HY or HZ window, set HPGAIN, the harmonic power gain register, the offset registers HX/HY/HZWATTOS, HX/HY/HZVAROS, HX/HY/HZIRMSOS and HX/HY/HZVRMSOS, and then click the **Write** button. Then press **Read** button to read back the values of the registers together with the harmonic calculations results related to the panel: HX/HY/HZWATT, HX/HY/HZVAR, HX/HY/HZIRMS, HX/HY/HZVRMS, HX/HY/HZVA, HX/HY/HZPF, HX/HY/HZIHD, HX/HY/HZVHD. Figure 19 shows the **Phase A Harmonic X** panel. Note that the neutral current selection does not have a panel to manage the fundamental information. As for neutral current, the fundamental information is managed through the HX, HY or HZ registers. Set one of these registers to 1 to analyze the fundamental information related to neutral current and the sum of the phase currents.

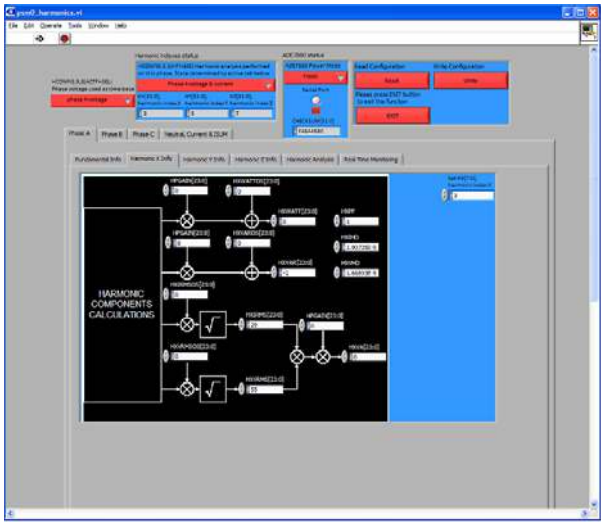

Figure 19. Phase A Harmonic X Panel

Each phase and neutral has a panel called **Real-Time Monitoring** (see Figure 20). This panel allows the user to monitor up to four ADE7880 harmonic calculation outputs: one on the fundamental, one on harmonic HX, one on harmonic HY, and one on harmonic HZ. Select the quantity to monitor, introduce the harmonic that is monitored using the HX, HY, and HZ registers, select the number of samples to acquire in real time, select the HCONFIG register settings and click the **Start Analysis** button. If four quantities are monitored, only up to 2433 samples can be acquired. If three quantities are monitored, up to 3244 samples can be acquired. If two quantities are monitored, up to 4866 samples can be acquired. If only one quantity is monitored, up to 9732 samples can be acquired. The program then displays the samples on up to four diagrams, computes the mean, maximum and minimum values of the acquisitions, and displays them at the right side of every drawing.

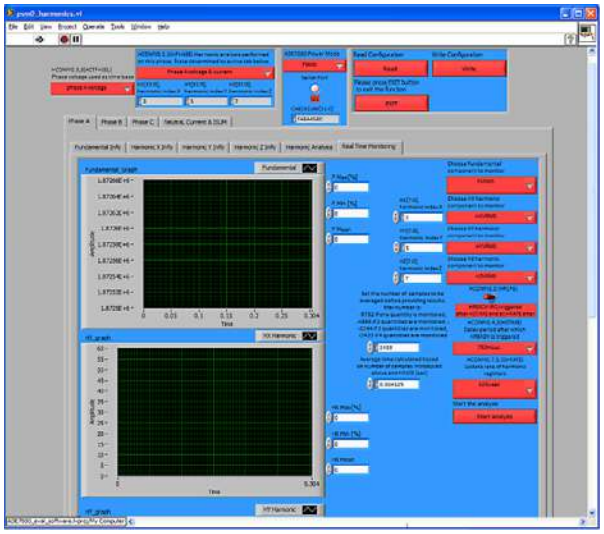

Figure 20. Phase A Real-Time Monitoring Panel

Apparent Power

When **Apparent Power** is selected on the **Front Panel**, a new panel is opened (see Figure 21). Similar to the other panels that deal with power measurement, this panel is divided into two parts: the lower half shows the apparent power data path of one phase and the ADE7880 status; the upper half shows the bits, registers, and commands necessary for power management.

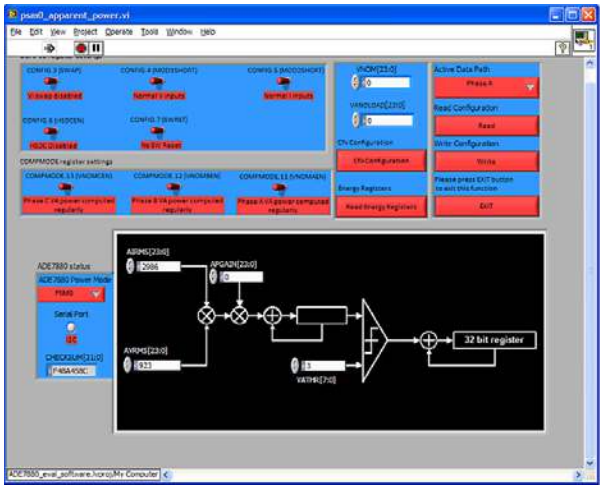

Figure 21. Apparent Power Panel

RMS Current

When **RMS Current** is selected on the **Front Panel**, a new panel is opened (see Figure 22). All data paths of all phases are available.

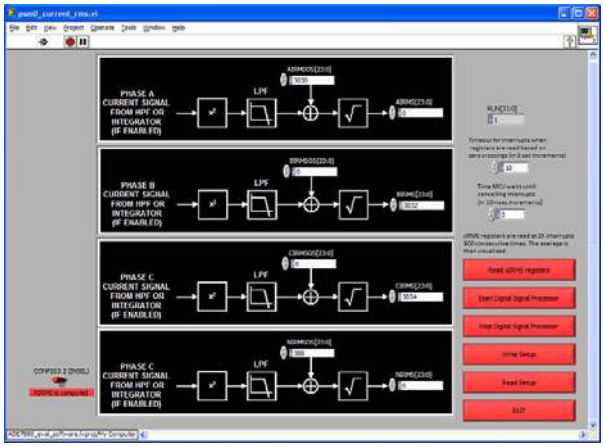

Figure 22. Current RMS Panel

Click the **Read Setup** button to read all registers shown in the panel. Click the **Write Setup** button to write to the xIRMSOS[23:0] registers.

You can use the **Start Digital Signal Processor** and **Stop Digital Signal Processor** buttons to manage the Run[15:0] register and the **Read xIRMS registers** button, which uses the ZXIA, ZXIB, and ZXIC interrupts at the $\overline{\text{IRQ1}}$ pin, to read the xIRMS[23:0] registers 500 consecutive times and then compute and display their average. If no interrupt occurs for the time indicated by the timeout (in 3 sec increments), the following

message is displayed: **No ZXIA, ZXIB or ZXIC interrupt was generated. Verify at least one sinusoidal signal is provided between IAP-IAN, IBP-IBN or ICP-ICN pins**. A delay can be introduced (in 10 ms increments) between the time that the IRQ pin goes low and the moment the xIRMS registers are read. The operation is repeated until the button is clicked again.

Mean Absolute Value Current

When **Mean Absolute Value Current** is selected on the **Front Panel**, a new panel is opened (see Figure 23). When the **Read xIMAV registers** button is clicked, the xIMAV[19:0] registers are read 10 consecutive times, and their averages are computed and displayed. After this operation, the button is returned to high automatically. The ADE7880 status is also displayed.

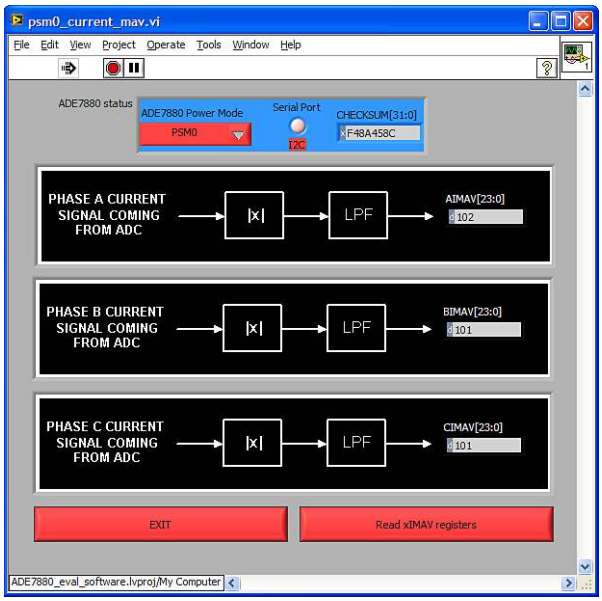

Figure 23. Mean Absolute Value Current Panel

RMS Voltage

When **RMS Voltage** is selected on the **Front Panel**, the **Voltage RMS** panel is opened (see Figure 24). This panel is very similar to the **Current RMS** panel. Clicking the **Read Setup** button executes a read of the xVRMSOS[23:0] and xVRMS[23:0] registers.

Clicking **Write Setup** writes the xVRMSOS[23:0] registers into the ADE7880. The **Start Digital Signal Processor** button manage the Run[15:0] register.

When the **Read xVRMS registers** button is clicked, the xVRMS[23:0] registers are read 500 consecutive times and the average is displayed. The operation is repeated until the button is clicked again. Note that the ZXVA, ZXVB, and ZXVC zero-crossing interrupts are not used in this case because they are disabled when the voltages go below 10% of full scale. This allows rms voltage registers to be read even when the phase voltages are very low.

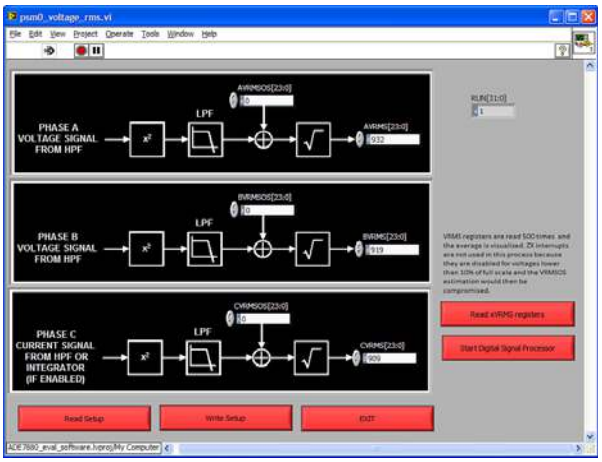

Figure 24. Voltage RMS Panel

Power Quality

The **Power Quality** panel is accessible from the **Front Panel** and is divided into two parts (see Figure 25). The lower part displays registers that manage the power quality measurement functions for the **Active Measurement** button in the upper part of the panel. The upper part also displays the ADE7880 status and the buttons that manage the measurements.

When the **READ CONFIGURATION** button is clicked, all power quality registers (MASK1[31:0], STATUS1[31:0], ZXTOUT[15:0], APERIOD[15:0], BPERIOD[15:0], CPERIOD[15:0], MMODE[7:0], ISUM[27:0], OVLVL[23:0], OILVL[23:0], PHSTATUS[15:0], IPEAK[31:0], VPEAK[31:0], SAGLVL[23:0], SAGCYC[7:0], ANGLE0[15:0], ANGLE1[15:0], ANGLE2[15:0], COMPMODE[15:0], CHECKSUM[31:0], PEAKCYC[7:0], and ISUMLVL[23:0]) are read, and the registers that belong to the active panel are displayed. Based on the APERIOD[15:0], BPERIOD[15:0], and CPERIOD[15:0] registers, the line frequencies on every phase are computed and displayed in the lower part of the panel (**Zero Crossing Measurements**). Based on the ANGLEx[15:0] registers, cos(ANGLEx) is computed and displayed in the **Time Intervals Between Phases** panel that is accessible from the **Active Measurement Zero Crossing** menu box (see Figure 25).

When the **WRITE CONFIGURATION** button is clicked, ZXTOUT[15:0], MMODE[7:0], OVLVL[23:0], OILVL[23:0], SAGLVL[23:0], SAGCYC[7:0], COMPMODE[15:0], PEAKCYC[7:0], and ISUMLVL[23:0] are written into the ADE7880, and CHECKSUM[31:0] is read back and displayed in the CHECKSUM[31:0] box at the top of the upper part of the panel.

Figure 25. Power Quality Zero-Crossing Measurements Panel

When the **WAIT FOR INTERRUPTS** button is clicked, the interrupts that you enabled in the MASK1[31:0] register are monitored. When the $\overline{\text{IRQ1}}$ pin goes low, the STATUS1[31:0] register is read and its bits are displayed. The ISUM[27:0], PHSTATUS[15:0], IPEAK[31:0], VPEAK[31:0], ANGLE0[15:0], ANGLE1[15:0], and ANGLE2[15:0] registers are also read and displayed. A timeout should be introduced in 3 sec increments to ensure that the program does not wait indefinitely for interrupts. A timer (in 10 ms increments) is provided to allow reading of the registers with a delay from the moment that the interrupt is triggered.

The **Active Measurement Zero Crossing** button provides access to the **Zero Crossing**, **Neutral Current Mismatch**, **Overvoltage and Overcurrent Measurements**, **Peak Detection**, Sag Detection Panel, and **Time Intervals Between Phases** panels (see Figure 25 through Figure 30).

The line frequency is computed using the xPERIOD[15:0] register, based on the following formula:

$$f = \frac{256{,}000}{Period}[Hz]$$

The cosine of the ANGLE0[15:0], ANGLE1[15:0], and ANGLE2[15:0] measurements is computed using the following formula:

$$cos(ANGLEx) = cos\left(\frac{ANGLEx \times 360 \times f}{256{,}000}\right)$$

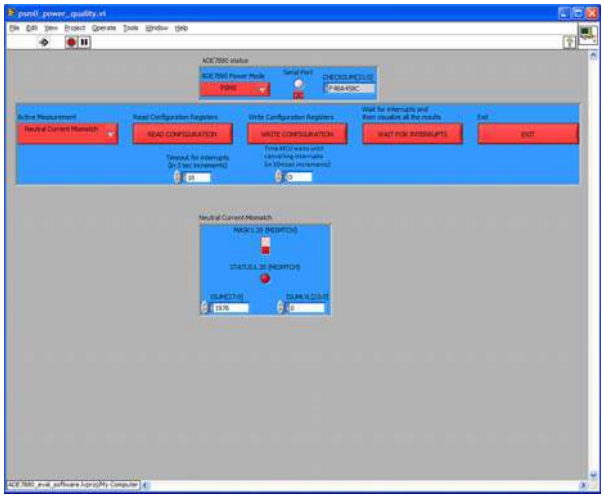

Figure 26. Neutral Current Mismatch Panel

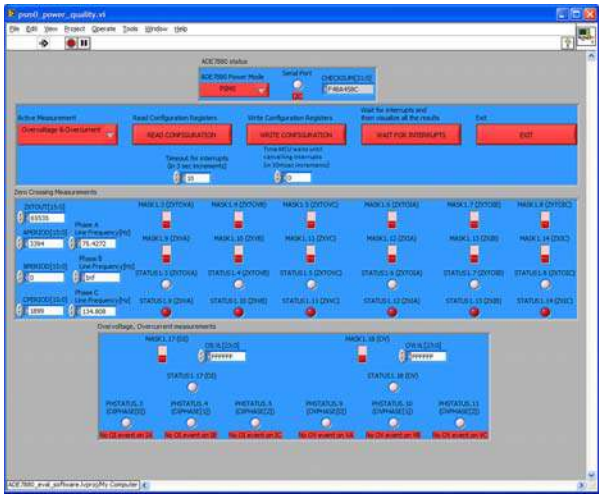

Figure 27. Overvoltage and Overcurrent Measurements Panel

Figure 28. Peak Detection Panel

Figure 29. Sag Detection Panel

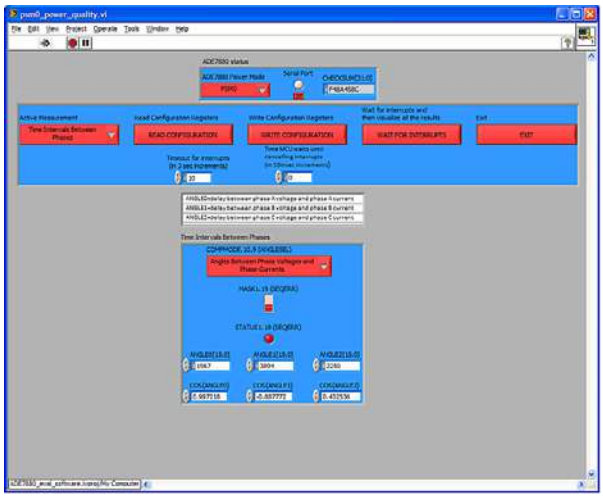

Figure 30. Time Intervals Between Phases Panel

Waveform Sampling

The **Waveform Sampling** panel (see Figure 31) is accessible from the **Front Panel** and uses the HSDC port to acquire data from the ADE7880 and display it. It can be accessed only if the communication between the ADE7880 and the NXP LPC2368 is through the I²C interface. See the Activating Serial Communication Between the ADE7880 and the NXP LPC2368section for details on how to set I²C communication on the ADE7880 evaluation board.

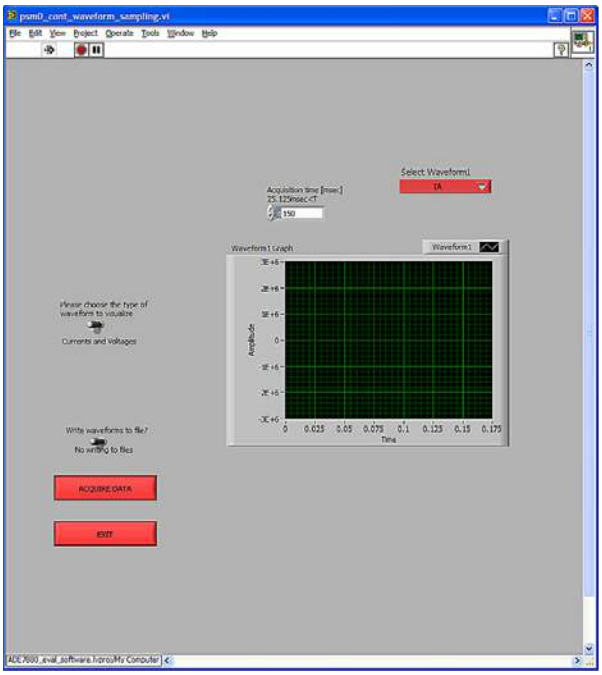

Figure 31. Waveform Sampling Panel

The HSDC transmits data to the NXP LPC2368 at 4 MHz because this is the maximum speed at which the slave SPI of the NXP LPC2368 can receive data. The panel contains some switches that must be set before acquiring data.

- One switch chooses the quantities that are displayed: phase currents and voltages or phase powers. For every set of quantities, only one can be acquired at a time. This choice is made using the **Select Waveform** button.
- A second switch allows acquired data to be stored in files for further use. This switch is set with the **Write waveforms to file?/No writing to files** button.
- The acquisition time should also be set before an acquisition is initiated. By default, this time is 150 ms, but any value in milliseconds can be introduced. The NXP LPC2368 executes three tasks in real time using the ping pong buffer method: continuously receiving data from HSDC, storing the data into its USB memory, and sending the data to the PC. Transmitting seven phase currents and voltages at 4 MHz takes 103.25 µs (which is less than 125 µs); therefore, the HSDC update rate is 8 kHz (HSDC_CFG = 0x0F). Transmitting nine phase powers takes 72 µs (again, less than 125 µs); therefore, the HSDC update rate is also 8 kHz (HSDC_CFG = 0x11).

To start the acquisition, click the **ACQUIRE DATA** button. The data is displayed on one plot. If you click the **Write waveforms to file?/No writing to files** switch to enable the writing of waveforms to a file, the program asks for the name and location of the files before storing the waveform.

Checksum Register

The **Checksum Register** panel is accessible from the **Front Panel** and provides access to all ADE7880 registers that are used to compute the CHECKSUM[31:0] register (see Figure 32). You can read/write the values of these registers by clicking the **Read** and **Write** buttons. The LabVIEW program calculates the value of the CHECKSUM[31:0] register and displays it whenever one of the registers is changed. When the **Read** button is clicked, the registers are read, and the CHECKSUM[31:0] register is read and its values displayed. This allows you to compare the value of the CHECKSUM[31:0] register calculated by LabVIEW with the value read from the ADE7880. The values should always be identical.

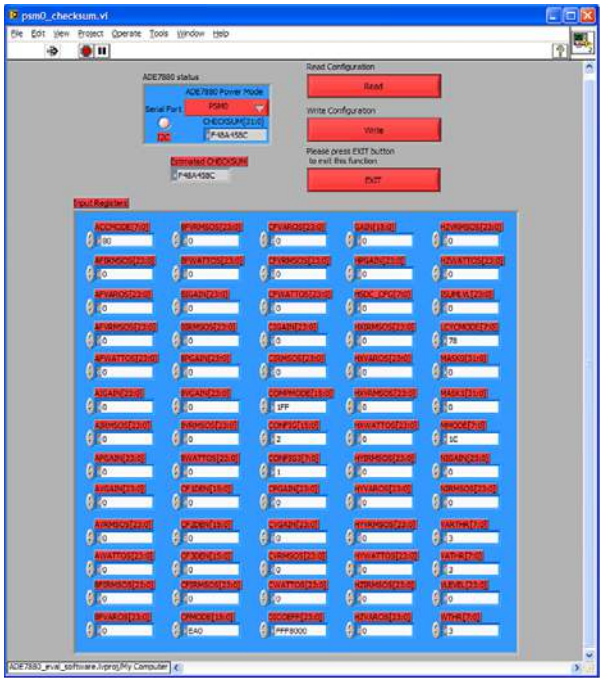

Figure 32. Checksum Register Panel

All Registers Access

The **All Registers Access** panel is accessible from the **Front Panel** and provides read/write access to all ADE7880 registers. Because there are many registers, the panel scrolls up and down and has multiple read, write, and exit buttons (see Figure 33 and Figure 34). The registers are listed in columns in alphabetical order, starting at the upper left. The panel also allows you to save all control registers into a data file by clicking the **Save All Regs into a file** button. By clicking the **Load All Regs from a file** button, you can load all control registers from a data file. Then, by clicking the **Write All Regs** button, you can load these values into the ADE7880. Registers STATUS0 and STATUS1 are also written, so interrupt status flags can be cleared and $\overline{\text{IRQ0}}$ and $\overline{\text{IRQ1}}$ lines brought high. The order in which the registers are stored in a file is shown in the Control Registers Data File section.

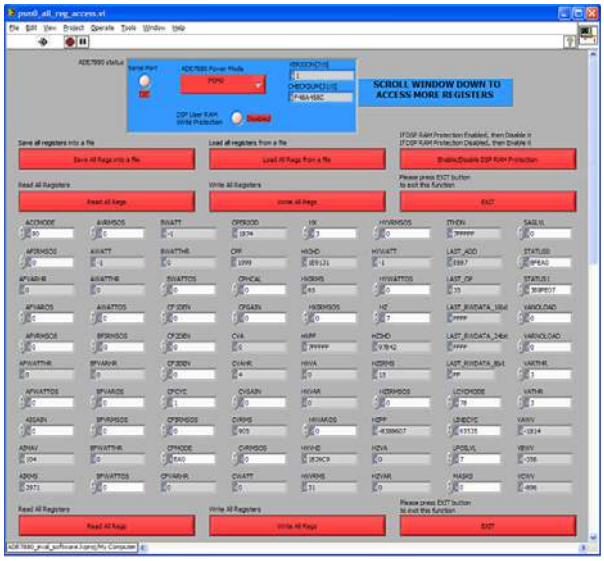

Figure 33. Panel Giving Access to All ADE7880 Registers (1)

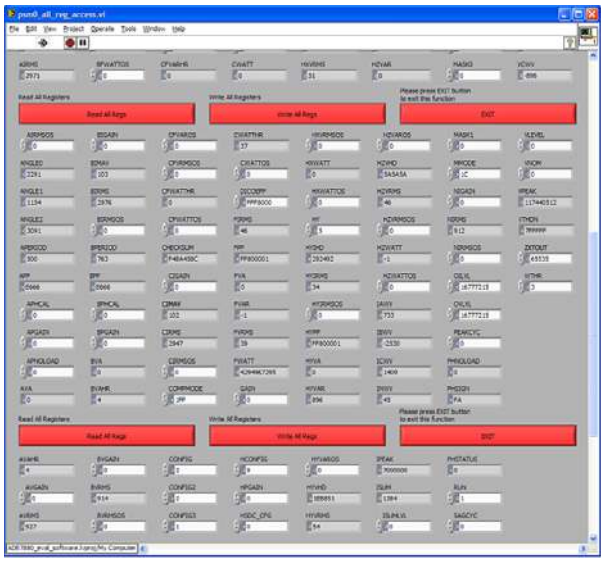

Figure 34. Panel Giving Access to All ADE7880 Registers (2)

Quick Startup

The **Quick Startup** panel is accessible from the **Front Panel** and can be used to rapidly initialize a 3-phase meter (see Figure 35).

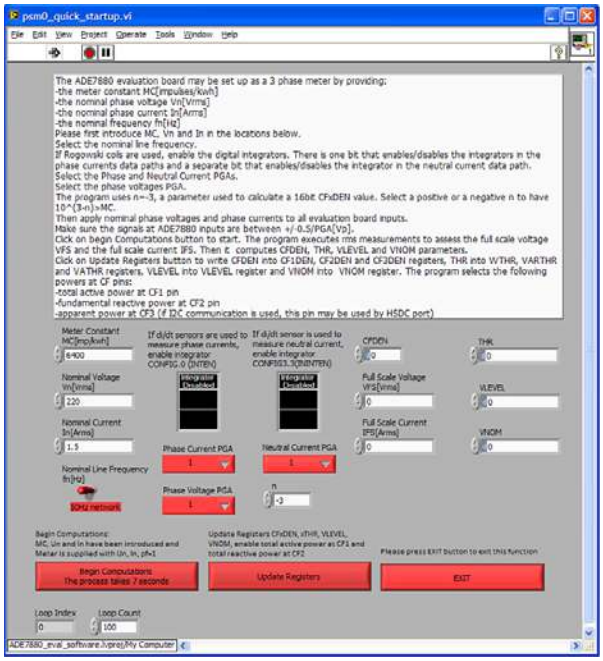

Figure 35. Panel Used to Quickly Set Up the 3-Phase Meter

The meter constant (MC, in impulses/kWh), the nominal voltage (VN, in V rms units), the nominal current (IN, in A rms units), and the nominal line frequency (fn, either 50 Hz or 60 Hz) must be set using the panel controls. Phase current, phase voltage, and neutral current PGA settings must also be provided. If Rogowski coils are used to sense the phase and neutral currents, integrators in the corresponding data paths must be enabled. Then phase voltages and phase currents must be provided through the relative sensors.

Clicking the **Begin Computations** button starts the program that reads rms voltages and currents and calculates the full-scale voltage and currents used to further initialize the meter. This process takes 7 sec as the program reads the rms voltages 100 times and the rms currents 100 times and then averages them (this is because the PC reads the rms values directly and cannot synchronize the readings with the zero crossings).

The program then computes the full-scale voltages and currents and the constants that are important for setting up the ADE7880: the constant n, CFDEN, WTHR, VARTHR, VATHR, VLEVEL, and VNOM.

After these values are calculated, you can overwrite these values. You can also click the **Update Registers** button to cause the program to do the following:

- Initialize the gain, CF1DEN, CF2DEN, CF3DEN, WTHR, VARTHR, VATHR, VLEVEL, and VNOM registers
- Enable the CF1 pin to provide a signal proportional to the total active power, the CF2 pin to provide a signal proportional to the fundamental reactive power, and the CF3 pin to provide a signal proportional to the apparent power.
- Select the state of Bit 14 (SELFRQ) in the COMPMODE register based on the nominal line frequency, fn.
- Enable/disable the digital integrators in the phase and neutral current data paths by setting the Bit 0 (INTEN) of the CONFIG register and Bit 3 (ININTEN) of the CONFIG3 register, accordingly.

At this point, the evaluation board is set up as a 3-phase meter, and calibration can be executed. To store the register initializations, click the **Save All Regs into a file** button in the **All Registers Access** panel (see Figure 33). After the board is powered down and then powered up again, the registers can be loaded into the ADE7880 by loading the contents of the data file. To do this, click the **Load All Regs from a file** button in the **All Registers Access** panel.

PSM2 Settings

The **PSM2 Settings** panel, which is accessible from the **Front Panel**, provides access to the LPOILVL[7:0] register that is used to access PSM2 low power mode (see Figure 36). You can edit the LPOIL[2:0] and LPLINE[4:0] bits. The value shown in the LPOILVL[7:0] register is composed from these bits and then displayed. Note that you cannot write a value into the register by writing a value in the LPOILVL[7:0] register box.

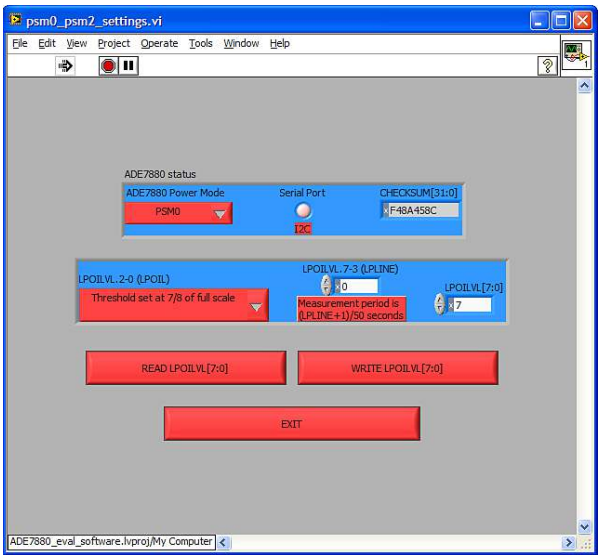

Figure 36. PSM2 Settings Panel

PSM1 MODE

Enter PSM1 Mode

When **Enter PSM1 mode** is selected on the **Front Panel**, the microcontroller manipulates the PM0 and PM1 pins of the ADE7880 to switch the ADE7880 into PSM1 reduced power mode. The submenu then allows access only to the **Mean Absolute Value Current** function because this is the only ADE7880 functionality available in this reduced power mode (see Figure 37).

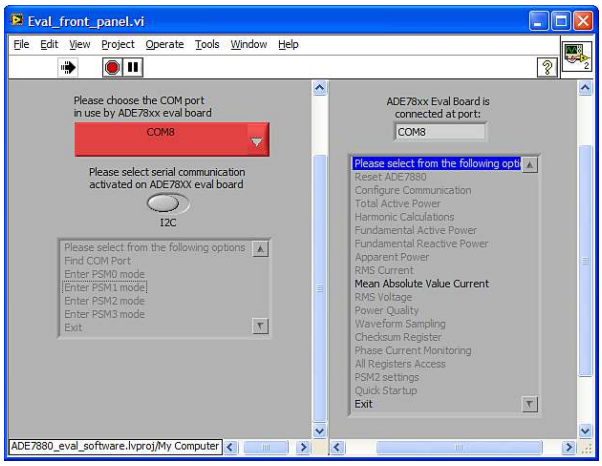

Figure 37. Front Panel After the ADE7880 Enters PSM1 Mode

Mean Absolute Value Current in PSM1 Mode

The **Mean Absolute Value Current** panel, which is accessible from the **Front Panel** when **Enter PSM1 mode** is selected, is very similar to the panel accessible in PSM0 mode (see the Mean Absolute Value Current section for details). The only difference is that **ADE7880 status** does not show the CHECKSUM[31:0] register because it is not available in PSM1 mode (see Figure 38).

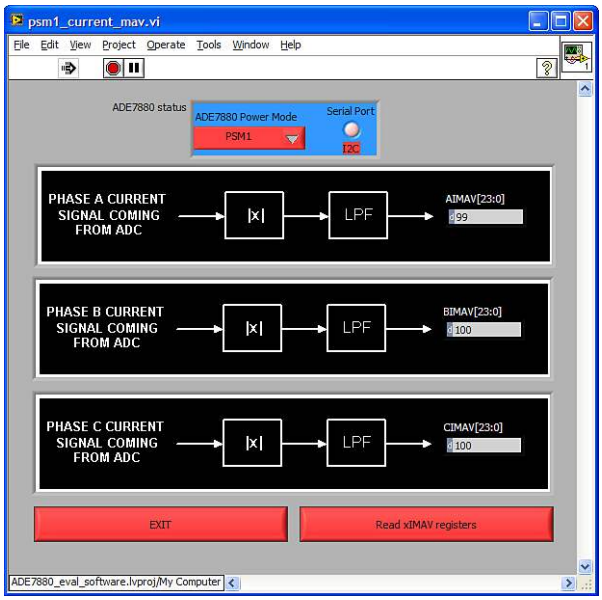

Figure 38. Mean Absolute Value Current Panel in PSM1 Mode

PSM2 MODE

Enter PSM2 Mode

When **Enter PSM2 mode** is selected on the **Front Panel**, the microcontroller manipulates the PM0 and PM1 pins of the ADE7880 to switch the ADE7880 into PSM2 low power mode. The submenu the allows access only to the **Phase Current Monitoring** function because this is the only ADE7880 functionality available in this low power mode.

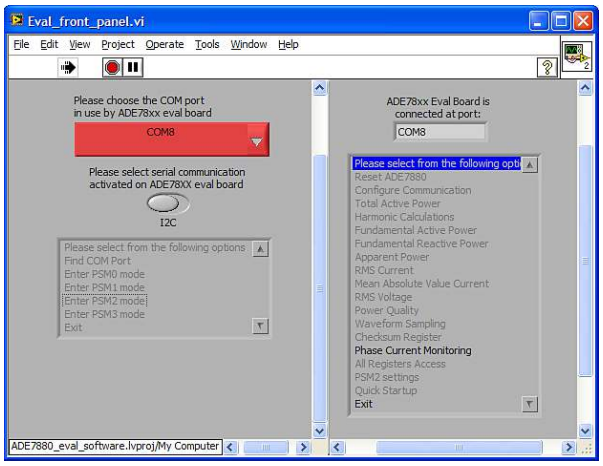

Figure 39. Front Panel After the ADE7880 Enters PSM2 Mode

Phase Current Monitoring

The **Phase Current Monitoring** panel is accessible from the **Front Panel** when **Enter PSM2 mode** is selected; it allows you to display the state of the $\overline{\text{IRQ0}}$ and $\overline{\text{IRQ1}}$ pins because, in PSM2 low power mode, the ADE7880 compares the phase currents against a threshold determined by the LPOILVL[7:0] register (see Figure 40). Clicking the **READ STATUS OF $\overline{\text{IRQ0}}$ AND $\overline{\text{IRQ1}}$ PINS** button reads the status of these pins and displays and interprets the status.

This operation is managed by the LPOILVL[7:0] register and can be modified only in PSM0 mode. The panel offers this option by switching the ADE7880 into PSM0 mode and then back to PSM2 mode when the **READ LPOILVL/WRITE LPOILVL** button is clicked. To avoid toggling both the PM0 and PM1 pins at the same time during this switch, the ADE7880 is set to PSM3 mode when changing modes.

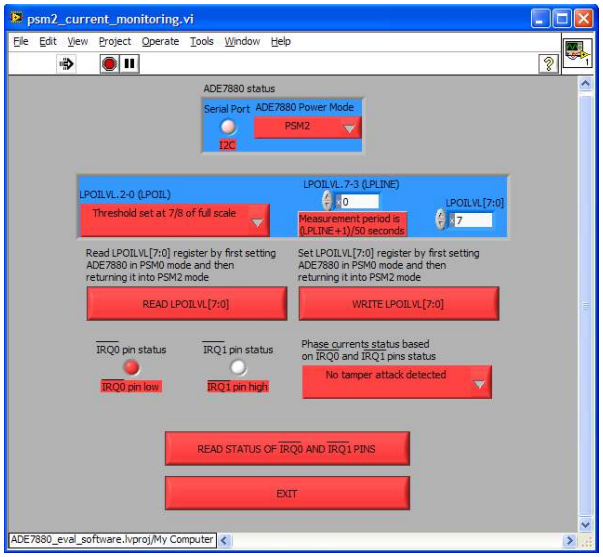

Figure 40. Panel Managing Current Monitoring in PSM2 Mode

PSM3 MODE

Enter PSM3 Mode

In PSM3 sleep mode, most of the internal circuits of the ADE7880 are turned off. Therefore, no submenu is activated in this mode. You can click the **Enter PSM0 mode**, **Enter PSM1 mode**, or **Enter PSM2** mode button to set the ADE7880 to one of these power modes.

MANAGING THE COMMUNICATION PROTOCOL BETWEEN THE MICROCONTROLLER AND THE ADE7880

This section lists the protocol commands that have been implemented to manage the ADE7880 from the PC using the microcontroller.

The microcontroller is a pure slave during the communication process. It receives a command from the PC, executes the command, and sends an answer to the PC. The PC should wait for the answer before sending a new command to the microcontroller.

Table 3. Echo Command—Message from the PC to the Microcontroller

Byte	Description
0	A = 0x41
1	N = number of bytes transmitted after this byte
2	Data Byte N – 1 (MSB)
3	Data Byte N – 2
4	Data Byte N – 3
…	…
N	Data Byte 1
N + 1	Data Byte 0 (LSB)

Table 4. Echo Command—Answer from the Microcontroller to the PC

Byte	Description
0	R = 0x52
1	A = 0x41
2	N = number of bytes transmitted after this byte
3	Data Byte N – 1 (MSB)
4	Data Byte N – 2
…	…
N + 1	Data Byte 1
N + 2	Data Byte 0 (LSB)

Table 5. Power Mode Select—Message from the PC to the Microcontroller

Byte	Description
0	B = 0x42, change PSM mode
1	N = 1
2	Data Byte 0: 0x00 = PSM0 0x01 = PSM1 0x02 = PSM2 0x03 = PSM3

Table 6. Power Mode Select—Answer from the Microcontroller to the PC

Byte	Description
0	R = 0x52
1	~ = 0x7E, to acknowledge that the operation was successful

Table 7. Reset—Message from the PC to the Microcontroller

Byte	Description
0	C = 0x43, toggle the $\overline{\text{RESET}}$ pin and keep it low for at least 10 ms
1	N = 1
2	Data Byte 0: this byte can have any value

Table 8. Reset—Answer from the Microcontroller to the PC

Byte	Description
0	R = 0x52
1	~ = 0x7E, to acknowledge that the operation was successful

Table 9. I²C/SPI Select (Configure Communication)—Message from the PC to the Microcontroller

Byte	Description
0	D = 0x44, select I²C and SPI and initialize them; then set CONFIG2[7:0] = 0x2 to lock in the port choice. When I²C is selected, also enable SSP0 of the LPC2368 (used for HSDC).
1	N = 1.
2	Data Byte 0: 0x00 = I²C, 0x01 = SPI.

Table 10. I²C/SPI Select (Configure Communication)—Answer from the Microcontroller to the PC

Byte	Description
0	R = 0x52
1	~ = 0x7E, to acknowledge that the operation was successful

Table 11. Data Write—Message from the PC to the Microcontroller

Byte	Description
0	E = 0x45.
1	N = number of bytes transmitted after this byte. N can be 1 + 2, 2 + 2, 4 + 2, or 6 + 2.
2	MSB of the address.
3	LSB of the address.
4	Data Byte N − 3 (MSB).
5	Data Byte N − 4.
6	Data Byte N − 5.
…	…
N + 2	Data Byte 1.
N + 3	Data Byte 0 (LSB).

Table 12. Data Write—Answer from the Microcontroller to the PC

Byte	Description
0	R = 0x52
1	~ = 0x7E, to acknowledge that the operation was successful

Table 13. Data Read—Message from the PC to the Microcontroller

Byte	Description
0	F = 0x46.
1	N = number of bytes transmitted after this byte; N = 3.
2	MSB of the address.
3	LSB of the address.
4	M = number of bytes to be read from the address above. M can be 1, 2, 4, or 6.

Table 14. Data Read—Answer from the Microcontroller to the PC

Byte	Description
0	R = 0x52.
1	MSB of the address.
2	LSB of the address.
3	Byte 5, Byte 3, Byte 1, or Byte 0 (MSB) read at the location indicated by the address. The location may contain 6, 4, 2, or 1 byte. The content is transmitted MSB first.
4	Byte 4, or Byte 2, or Byte 0.
5	Byte 3, or Byte 1.
6	Byte 2 or Byte 0.
7	Byte 1.
8	Byte 0.

Table 15. Interrupt Setup—Message from the PC to the Microcontroller

Byte	Description
0	J = 0x4A.
1	N = 8, number of bytes transmitted after this byte.
2	MSB of the MASK1[31:0] or MASK0[31:0] register.
3	LSB of the MASK1[31:0] or MASK0[31:0] register.
4	Byte 3 of the desired value of the MASK0[31:0] or MASK1[31:0] register.
5	Byte 2.
6	Byte 1.
7	Byte 0.
8	Timeout byte: time the MCU must wait for the interrupt to be triggered. It is measured in 3 sec increments. Timeout byte (TOB) = 0 means that timeout is disabled.
9	IRQ timer: time the MCU leaves the $\overline{\text{IRQx}}$ pin low before writing back to clear the interrupt flag. It is measured in 10 ms increments. Timer = 0 means that timeout is disabled.

Table 16. Interrupt Setup—Message from the Microcontroller to the PC

Byte	Description
0	R = 0x52.
1	Byte 3 of the STATUS0[31:0] or STATUS1[31:0] register. If the program waited for TOB × 3 sec and the interrupt was not triggered, then Byte 3 = Byte 2 = Byte 1 = Byte 0 = 0xFF.
2	Byte 2 of the STATUS0[31:0] or STATUS1[31:0] register.
3	Byte 1 of the STATUS0[31:0] or STATUS1[31:0] register.
4	Byte 0 of the STATUS0[31:0] or STATUS1[31:0] register.

The microcontroller executes the following operations after the interrupt setup command is received:

1. Reads the STATUS0[31:0] or STATUS1[31:0] register (depending on the address received from the PC) and, if it shows an interrupt already triggered (one of its bits is equal to 1), it erases the interrupt by writing it back.
2. Writes to the MASK0[31:0] or MASK1[31:0] register with the value received from the PC.
3. Waits for the interrupt to be triggered. If the wait is more than the timeout specified in the command, 0xFFFFFFFF is sent back.
4. If the interrupt is triggered, the STATUS0[31:0] or STATUS1[31:0] register is read and then written back to clear it. The value read at this point is the value sent back to the PC so that the user can see the source of the interrupts.
5. Sends back the answer.

Table 17. Interrupt Pins Status—Message from the PC to the Microcontroller

Byte	Description
0	H = 0x48.
1	N = 1, number of bytes transmitted after this byte.
2	Any byte. This value is not used by the program but it is used in the communication because N must not be equal to 0.

Table 18. Interrupt Pins Status—Answer from the Microcontroller to the PC

Byte	Description
0	R = 0x52.
1	A number representing the status of the $\overline{\text{IRQ0}}$ and $\overline{\text{IRQ1}}$ pins. 0: $\overline{\text{IRQ0}}$ = low, $\overline{\text{IRQ1}}$ = low. 1: $\overline{\text{IRQ0}}$ = low, $\overline{\text{IRQ1}}$ = high. 2: $\overline{\text{IRQ0}}$ = high, $\overline{\text{IRQ1}}$ = low. 3: $\overline{\text{IRQ0}}$ = high, $\overline{\text{IRQ1}}$ = high. The reason for the $\overline{\text{IRQ0}}$ and $\overline{\text{IRQ1}}$ order is that on the microcontroller I/O port, $\overline{\text{IRQ0}}$ = P0.1 and $\overline{\text{IRQ1}}$ = P0.0.

ACQUIRING HSDC DATA CONTINUOUSLY

This function acquires data from the HSDC continuously for a defined time period and for up to two variables. The microcontroller sends data in packages of 4 kB.

Table 19 describes the protocol when two instantaneous phase currents or voltages are acquired.

Table 19. Acquire HSDC Data Continuously—Message from the PC to the Microcontroller If Phase Currents and Voltages Are Acquired

Byte	Description
0	G = 0x47.
1	N = number of bytes transmitted after this byte. N = 32.
2	0: corresponds to Byte 3 of IA. Because this byte is only a sign extension of Byte 2, it is not sent back by the microcontroller.
3	Increment_IA_Byte2. If IA is to be acquired, Byte 3, Byte 4, and Byte 5 are 1. Otherwise, they are 0.
4	Increment_IA_Byte1.
5	Increment_IA_Byte2.
6	0.
7	Increment_VA_Byte2. If VA is to be acquired, Byte 7, Byte 8, and Byte 9 are 1. Otherwise, they are 0.
8	Increment_VA_Byte1.
9	Increment_VA_Byte0.
10	0.
11	Increment_IB_Byte2. If IB is to be acquired, Byte 11, Byte 12, and Byte 13 are 1. Otherwise, they are 0.
12	Increment_IB_Byte1.
13	Increment_IB_Byte0.
14	0.
15	Increment_VB_Byte2. If VB is to be acquired, Byte 15, Byte 16, and Byte 17 are 1. Otherwise, they are 0.
16	Increment_VB_Byte1.
17	Increment_VB_Byte0.
18	0.
19	Increment_IC_Byte2. If IC is to be acquired, Byte 19, Byte 20, and Byte 21 are 1. Otherwise, they are 0.
20	Increment_IC_Byte1.
21	Increment_IC_Byte0.
22	0.
23	Increment_VC_Byte2. If VC is to be acquired, Byte 23, Byte 24, and Byte 25 are 1. Otherwise, they are 0.
24	Increment_VC_Byte1.
25	Increment_VC_Byte0.
26	0.
27	Increment_IN_Byte2. If IN is to be acquired, Byte 27, Byte 28, and Byte 29 are 1. Otherwise, they are 0.
28	Increment_IN_Byte1.
29	Increment_IN_Byte0.
30	Byte 1 of M. M is a 16-bit number. The number of 32-bit samples acquired by the microcontroller is $(2 \times M + 1) \times 67$ per channel.
31	Byte 0 of M.

If two of the phase powers are to be acquired, the protocol changes (see Table 20).

Table 20. Acquire HSDC Data Continuously—Message from the PC to the Microcontroller If Phase Powers Are Acquired

Byte	Description
0	G = 0x47.
1	N = number of bytes transmitted after this byte. N = 38.
2	0: corresponds to Byte 3 of AVA. Because this byte is only a sign extension of Byte 2, it is not sent back by the microcontroller.
3	Increment_AVA_Byte2. If AVA is to be acquired, Byte 3, Byte 4, and Byte 5 are 1. Otherwise, they are 0.
4	Increment_AVA_Byte1.
5	Increment_AVA_Byte2.
6	0.
7	Increment_BVA_Byte2. If BVA is to be acquired, Byte 7, Byte 8, and Byte 9 are 1. Otherwise, they are 0.
8	Increment_BVA_Byte1.
9	Increment_BVA_Byte0.
10	0.
11	Increment_CVA_Byte2. If CVA is to be acquired, Byte 11, Byte 12, and Byte 13 are 1. Otherwise, they are 0.
12	Increment_CVA_Byte1.
13	Increment_CVA_Byte0.
14	0.
15	Increment_AWATT_Byte2. If AWATT is to be acquired, Byte 15, Byte 16, and Byte 17 are 1. Otherwise, they are 0.
16	Increment_AWATT_Byte1.
17	Increment_AWATT_Byte0.
18	0.
19	Increment_BWATT_Byte2. If BWATT is to be acquired, Byte 19, Byte 20, and Byte 21 are 1. Otherwise, they are 0.
20	Increment_BWATT_Byte1.
21	Increment_BWATT_Byte0.
22	0.
23	Increment_CWATT_Byte2. If CWATT is to be acquired, Byte 23, Byte 24, and Byte 25 are 1. Otherwise, they are 0.
24	Increment_CWATT_Byte1.
25	Increment_CWATT_Byte0.
26	0.
27	Increment_AVAR_Byte2. If AVAR is to be acquired, Byte 27, Byte 28, and Byte 29 are 1. Otherwise, they are 0.
28	Increment_AVAR_Byte1.
29	Increment_AVAR_Byte0.
30	0.
31	Increment_BVAR_Byte2. If BVAR is to be acquired, Byte 31, Byte 32, and Byte 33 are 1. Otherwise, they are 0.
32	Increment_BVAR_Byte1.
33	Increment_BVAR_Byte0.
34	0.
35	Increment_CVAR_Byte2. If CVAR is to be acquired, Byte 35, Byte 36, and Byte 37 are 1. Otherwise, they are 0.
36	Increment_CVAR_Byte1.
37	Increment_CVAR_Byte0.
38	Byte 1 of M. M is a 16-bit number. The number of 32-bit samples acquired by the microcontroller is $(2 \times M + 1) \times 67$ per channel.
39	Byte 0 of M.

After receiving the command, the microcontroller enables the HSDC port and acquires 67 × 7 × 4 = 1876 bytes into BUFFER0. As soon as BUFFER0 is filled, data is acquired in BUFFER1 (equal in size to BUFFER0), while 2 × 3 × 67 = 402 bytes (134 24-bit words) from BUFFER0 are transmitted to the PC. As soon as BUFFER1 is filled, data is acquired into BUFFER0 while 402 bytes from BUFFER1 are transmitted to the PC. Only the least significant 24 bits of every 32-bit instantaneous value are sent to the PC to decrease the size of the buffer sent to the PC. The most significant eight bits are only an extension of a 24-bit signed word; therefore, no information is lost. The protocol used by the microcontroller to send data to the PC is shown in Table 21.

Table 21. Acquire HSDC Data Continuously—Answer from the Microcontroller to the PC

Byte	Description
0	R = 0x52
1	Byte 2 (MSB) of Word 1
2	Byte 1 of Word 1
3	Byte 0 (LSB) of Word 1
4	Byte 2 (MSB) of Word 2
5	Byte 1 (MSB) of Word 2
…	…
402	Byte 0 (LSB) of Word 134

STARTING THE ADE7880 DSP

This function orders the microcontroller to start the DSP. The microcontroller writes to the run register with 0x1.

Table 22. Start ADE7880 DSP—Message from the PC to the Microcontroller

Byte	Description
0	N = 0x4E
1	N = number of bytes transmitted after this byte; N = 1
2	Any byte

Table 23. Start ADE7880 DSP—Answer from the Microcontroller to the PC

Byte	Description
0	R = 0x52
1	~ = 0x7E, to acknowledge that the operation was successful

STOPPING THE ADE7880 DSP

This function orders the microcontroller to stop the DSP. The microcontroller writes to the run register with 0x0.

Table 24. Stop ADE7880 DSP—Message from the PC to the Microcontroller

Byte	Description
0	O = 0x4F
1	N = number of bytes transmitted after this byte; N = 1
2	Any byte

Table 25. Stop ADE7880 DSP—Answer from the Microcontroller to the PC

Byte	Description
0	R = 0x52
1	~ = 0x7E to acknowledge that the operation was successful

Table 26. Harmonic Calculations Management—Message from the PC to the Microcontroller

Byte	Description
0	S = 0x53
1	N = number of bytes transmitted after this byte; N = 7
2	MS Byte 3 of the number of samples N_samples
3	Byte 2 of the number of samples N_samples
4	Byte 1 of the number of samples N_samples
5	LS Byte 0 of the number of samples N_samples

Byte	Description
6	Phase A, Phase B, or Phase C variables under analysis: 0 = VRMS and IRMS 1 = WATT and VAR 2 = VA and PF 3 = VHD and IHD Neutral current and ISUM variables under analysis: 0 = ISUMRMS and NIRMS 3 = ISUMHD and NIHD
7	MS byte of HCONFIG
8	LS byte of HCONFIG

Table 27. Harmonic Calculations Management—Answer from the Microcontroller to the PC

Byte	Description
0	LS Byte 0 of 64-bit fundamental of the first quantity (Q1) to monitor: VRMS or WATT or VA or VHD
1	Byte 1 of 64-bit fundamental Q1
2	Byte 2 of 64-bit fundamental Q1
3	Byte 3 of 64-bit fundamental Q1
4	Byte 4 of 64-bit fundamental Q1
5	Byte 5 of 64-bit fundamental Q1
6	Byte 6 of 64-bit fundamental Q1
7	MS Byte 7 of 64-bit fundamental Q1
8	LS Byte 0 of 64-bit fundamental of the second quantity (Q2) to monitor: IRMS or VAR or PF or IHD
9	Byte 1 of 64-bit fundamental Q2
10	Byte 2 of 64-bit fundamental Q2
11	Byte 3 of 64-bit fundamental Q2
12	Byte 4 of 64-bit fundamental Q2
13	Byte 5 of 64-bit fundamental Q2
14	Byte 6 of 64-bit fundamental Q2
15	Byte 7 of 64-bit fundamental Q2
16	LS Byte 0 of 64-bit Harmonic 2 Q1
…	
24	LS Byte 0 of 64-bit Harmonic 2 Q2
….	
32	LS Byte 0 of 64-bit Harmonic 3 Q1
…	
40	LS Byte 0 of 64-bit Harmonic 3 Q2
…	
62 × 16 = 992	LS Byte 0 of 64-bit Harmonic 63 Q1
….	
8 + 62 × 16 = 1000	LS Byte 0 of 64-bit Harmonic 63 Q2
…	
1007	MS Byte 7 of 64-bit Harmonic 63 Q2

Table 28. Real-Time Monitoring of Harmonics—Message from the PC to the Microcontroller

Byte	Description
0	T = 0x54.
1	N = number of bytes transmitted after this byte; N = 9.
2	Byte identifying the fundamental and HX components to monitor. If neutral current is monitored, the F components are set to 0. Bits[3:0] identify the fundamental component to monitor: 0 = no fundamental component to monitor. 1 = FVRMS. 2 = FIRMS. 3 = FWATT. 4 = FVAR. 5 = FVA. 6 = FPF. 7 = VTHDN. 8 = ITHDN. Bits[7:4] identify the HX component to monitor. 0 = no HX component to monitor. 1 = HXVRMS. 2 = HXIRMS. 3 = HXWATT. In neutral current case, this option is reserved. 4 = HXVAR. In neutral current case, this option is reserved. 5 = HXVA. In neutral current case, this option is reserved. 6 = HXPF. In neutral current case, this option is reserved. 7 = HXVHD. 8 = HXIHD.
3	Byte identifying the HY and HZ components to monitor. Bits[3:0] identify the HY component to monitor: 0 = no HY component to monitor. 1 = HYVRMS. 2 = HYIRMS. 3 = HYWATT. In neutral current case, this option is reserved. 4 = HYVAR. In neutral current case, this option is reserved. 5 = HYVA. In neutral current case, this option is reserved. 6 = HYPF. In neutral current case, this option is reserved. 7 = HYVHD. 8 = HYIHD. Bits[7:4] identify the HZ component to monitor. 0 = no HZ component to monitor. 1 = HZVRMS. 2 = HZIRMS. 3 = HZWATT. In neutral current case, this option is reserved. 4 = HZVAR. In neutral current case, this option is reserved. 5 = HZVA. In neutral current case, this option is reserved. 6 = HZPF. In neutral current case, this option is reserved. 7 = HZVHD. 8 = HZIHD.
4	Byte equal to the LS byte (Byte 0) of HX register.
5	Byte equal to the LS byte (Byte 0) of HY register.
6	Byte equal to the LS byte (Byte 0) of HZ register.
7	MS byte of the number of samples N_samples.
8	LS byte of the number of samples N_samples.
9	MS byte of HCONFIG.
10	LS byte of HCONFIG.

Table 29. Real-Time Monitoring of Harmonics[1]

Byte	Description
0	Byte 2 of Sample 0
1	Byte 1 of Sample 0
2	Byte 0 of Sample 0
3	Byte 2 of Sample 1
4	Byte 1 of Sample 1
5	Byte 0 of Sample 1
…	
3 × N_sample-3	Byte 2 of Sample N_sample-1
3 × N_sample-2	Byte 1 of Sample N_sample-1
3 × N_sample-1	Byte 0 of Sample N_sample-1

[1] Answer from the microcontroller to the PC if one quantity is monitored.

Table 30. Real-Time Monitoring of Harmonics[1]

Byte	Description
0	Byte 2 of Sample 0 of Q1
1	Byte 1 of Sample 0 of Q1
2	Byte 0 of Sample 0 of Q1
3	Byte 2 of Sample 0 of Q2
4	Byte 1 of Sample 0 of Q2
5	Byte 0 of Sample 0 of Q2
6	Byte 2 of Sample 1 of Q1
7	Byte 1 of Sample 1 of Q1
8	Byte 0 of Sample 1 of Q1
9	Byte 2 of Sample 1 of Q2
10	Byte 1 of Sample 1 of Q2
11	Byte 0 of Sample 1 of Q2
…	
3 × 2 × N_sample-3	Byte 2 of Sample N_sample-1 of Q2
3 × 2 × N_sample-2	Byte 1 of Sample N_sample-1 of Q2
3 × 2 × N_sample-1	Byte 0 of Sample N_sample-1 of Q2

[1] Answer from the microcontroller to the PC if two quantities, Q1 and Q2, are monitored.

Table 31. Real-Time Monitoring of Harmonics[1]

Byte	Description
0	Byte 2 of Sample 0 of Q1
1	Byte 1 of Sample 0 of Q1
2	Byte 0 of Sample 0 of Q1
3	Byte 2 of Sample 0 of Q2
4	Byte 1 of Sample 0 of Q2
5	Byte 0 of Sample 0 of Q2
6	Byte 2 of Sample 0 of Q3
7	Byte 1 of Sample 0 of Q3
8	Byte 0 of Sample 0 of Q3

21	Byte 2 of Sample 1 of Q4
22	Byte 1 of Sample 1 of Q4
23	Byte 0 of Sample 1 of Q4
…	
3 × 4 × N_sample-3	Byte 2 of Sample N_sample-1 of Q4
3 × 4 × N_sample-2	Byte 1 of Sample N_sample-1 of Q4
3 × 4 × N_sample-1	Byte 0 of Sample N_sample-1 of Q4

[1] Answer from the microcontroller to the PC if four quantities, Q1, Q2, Q3, and Q4, are monitored.

UPGRADING MICROCONTROLLER FIRMWARE

Although the evaluation board is supplied with the microcontroller firmware already installed, the ADE7880 evaluation software CD provides the NXP LPC2368 microcontroller project developed under the IAR embedded workbench environment for ARM. Users in possession of this tool can modify the project at will and can download it using an IAR J-link debugger. As an alternative, the executable can be downloaded using a program called Flash Magic, available on the evaluation software CD or at the Flash Magic website.

Flash Magic uses the PC COM port to download the microcontroller firmware. The procedure for using Flash Magic is as follows:

1. Plug a serial cable into connector P15 of the ADE7880 evaluation board and into a PC COM port. As an alternative, use the ADE8052Z-DWDL1 ADE downloader from Analog Devices, Inc., together with a USB cable.
2. Launch the **Device Manager** under Windows XP by writing **devmgmt.msc** into the **Start/Run** box. This helps to identify which COM port is used by the serial cable.
3. Plug the USB2UART board into the P15 connector of the ADE7880 evaluation board with the VDD pin of the USB2UART aligned at Pin 1 of P15.
4. Supply the microcontroller side of the board by connecting a USB cable between a PC and the P1 connector of the board.
5. Press the S3 button. The P2.10/$\overline{\text{EINT0}}$ pin of the microcontroller is now connected to ground.
6. While keeping the S3 button pressed, press and release the reset button, S2, on the ADE7880 evaluation board. Then release S3.
7. Launch Flash Magic and do the following:
   a. Select a COM port (COMx as seen in the **Device Manager**).
   b. Set the baud rate to 115,200.
   c. Select the NXP LPC2368 device.
   d. Set the interface to none (ISP).
   e. Set the oscillator frequency (MHz) to 12.0.
   f. Select **Erase all Flash + Code Rd Block**.
   g. Choose **ADE7880_Eval_Board.hex** from the **\Debug\Exe** project folder.
   h. Select **Verify after programming**.

   The Flash Magic settings are shown in Figure 41.

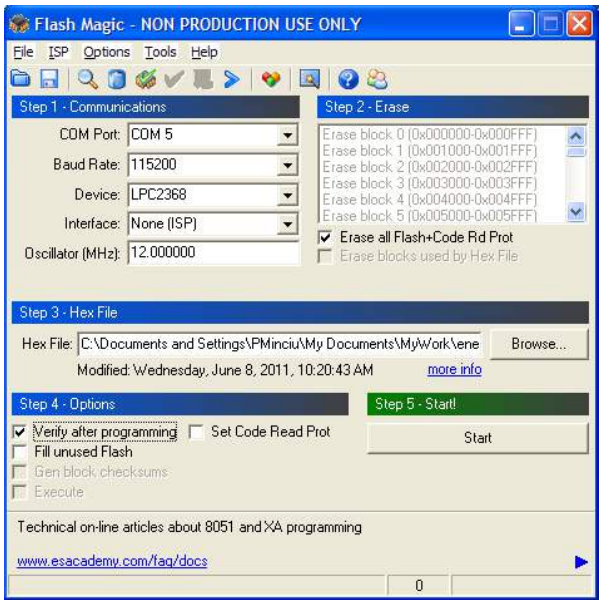

Figure 41. Flash Magic Settings

8. Click **Start** to begin the download process.
9. After the process finishes, remove the USB cable from the P1 connector and reinsert it. Supply 3.3 V at P9 connector to supply the ADE7880 side of the board. The board is now ready to operate.
10. When the PC recognizes the evaluation board and asks for a driver, select the project **\VirCOM_Driver_XP** folder if Windows XP is the operating system. The **ADE7880_eval_board_vircomport.inf** file is the driver. If the operating system is Windows 7 64-bit, the driver is in the **VirCOM_Driver_W7_64bit** folder. The **ADE7880_eval_board_vircomport_W7_64bit.inf** file is the driver.

CONTROL REGISTERS DATA FILE

Table 33 shows the order in which the control registers of the ADE7880 are stored into a data file when you click the **Save All Regs into a file** button in the **All Registers Access** panel.

ORDERING INFORMATION

BILL OF MATERIALS

Table 34.

Qty	Designator	Description	Manufacturer/Part Number
1	A1	IC, 1.2 V ultralow power high PSRR voltage reference	Analog Devices/ADR280ARTZ
1	A2	IC, swappable dual isolator	Analog Devices/ADuM1250ARZ
10	AGND1 to AGND10	Connector, PCB, test point, black	COMPONENTS_CORPORATION/TP-104-01-00
30	VN, CF1, IAN, IAP, IBN, IBP, ICN, ICP, INN, INP, PM0, PM1, REF, VAP, VBP, VCP, AVDD, DVDD, XREF, CLKIN, IRQ0, IRQ1, CLKOUT, RESET, SS/HSA, MISO/HSD, MOSI/SDA, SCLK/SCL, CF3/HSCLK, CF2/HREADY	Connector, PCB, test point, grey	COMPONENTS_CORPORATION/TP-104-01-08
5	C1, C8, C61, C62, C64	Capacitor, monolithic, ceramic, 10 µF	Murata/GRM21BR61C106KE15L
20	C9 to C28	Capacitor, ceramic chip, C0G, 0603, 2.2 nF	TDK/C1608C0G1H222J
27	C2, C7, C33 to C35, C37, C38, C40 to C46, C48 to C60	Capacitor, X7R, 0805, 100 nF	Murata/GRM21BR71H104KA01L
4	C29, C30, C65, C66	Capacitor, monolithic, ceramic, C0G, 0402, 20 pF	Murata/GRM1555C1H200JZ01D
3	C3, C5, C36	Capacitor, ceramic, 0805, X5R, 4.7 µF	Taiyo Yuden/EMK212BJ475KG-T
3	C32, C67, C68	Capacitor, ceramic, 1206, X7R, 1 µF	Taiyo Yuden/GMK316B7105KL-T
2	C4, C6	Capacitor, ceramic, X7R, 0.22 µF	Phycomp (Yageo)/2222 780 15654
1	C63	Capacitor, ceramic, X7R, 0.01 µF	AVX/0306ZC103KAT2A
3	CF1_ISO to CF3_ISO	Connector, PCB coax, vertical, BNC, 50 Ω	Tyco Electronics/5227699-2
5	CR1 to CR5	Diode, LED, green, SMD	Chicago Mini Lamp/CMD28-21VGCTR8T1
2	CR6, CR7	LED, green, surface mount	Lumex/SML-LXT0805GW-TR
1	D1	Diode, 6.2 V, Zener, SMA	Micro Commercial Co./SMAJ4735A-TP
12	E1A to E3A, E1B to E3B, E1C to E3C, E1N to E3N	Inductor, chip, ferrite bead, 0805, 1500 Ω	Murata/BLM21BD152SN1D
1	EXT_CLKIN	Connector, PCB coax, SMB, RA	Johnson/131-3701-301
13	HSA_ISO, SCL_ISO, SDA_ISO, SSB_ISO, MISO_ISO, MOSI_ISO, PM0_CTRL, PM1_CTRL, SCLK_ISO, IRQ0B_ISO, IRQ1B_ISO, RESB_CTRL, HSDATA_ISO	Connector, PCB, test point, white	COMPONENTS_CORPORATION/TP-104-01-09
10	JP11, JP24, JP31 to JP34, JP7A, JP7B, JP7C, JP7N	3-pin jumper	N/A/
29	JP12, JP1A to JP6A, JP1B to JP6B, JP1C to JP6C, JP1N to JP6N, JP21, JP9A, JP9B, JP9C	Connector, PCB Berg jumper, ST, male 2-pin	BERG/69157-102
2	JP22, JP23	Resistor jumper, SMD 1206 (short)	Panasonic/ERJ-8GEYJ0.0
2	JP61, JP62	Resistor jumper, SMD 0805 (open)	Panasonic/ERJ-6GEYJ0.0
2	VDD, MCU_VDD	Connector, PCB, test point, red	COMPONENTS_CORPORATION/TP-104-01-02
3	MGND1 to MGND3	Connector, PCB, test point, green	COMPONENTS_CORPORATION/TP-104-01-05
11	P1 to P10, P12	Connector, PCB term, black, 2-pin, ST	Weiland/25.161.0253

Qty	Designator	Description	Manufacturer/Part Number
2	P11, P17	Connector, PCB, header, SHRD, ST, male 32-pin	Samtec/TSW-1-30-08-G-D
1	P13	Connector, PCB, header, ST, male 20-pin	Samtec/TSW-110-08-G-D
1	P14	Connector, PCB, USB, Type B, R/A, through hole	AMP/4-1734376-8
1	P15	Connector, PCB, header, ST, male 4-pin	Samtec/TSW-104-08-G-S
1	P16	Connector, PCB, straight header 3-pin	Molex/22-03-2031
5	Q1 to Q5	Trans digital FET P channel	Fairchild/FDV302P
8	R9 to R16	Resistor, precision thick film, chip R1206, 100 Ω	Panasonic/ERJ-8ENF1000V
15	R17 to R25, R29 to R34	Resistor, precision thick film, chip R0805, 1 kΩ	Panasonic/ERJ-6ENF1001V
3	R26 to R28	Resistor, precision thick film, chip R0805, 1 MΩ	Panasonic/ERJ-6ENF1004V
37	R37, R43 to R56, R59 to R65, R67 to R75, R77, R81 to R85	Resistor, precision thick film, chip R0805, 10 kΩ	Panasonic/ERJ-6ENF1002V
5	R38 to R42	Resistor, precision thick film, chip R1206, 499 Ω	Panasonic/ERJ-8ENF4990V
1	R57	Resistor, film, SMD 0805, 220 kΩ	Multicomp/MC 0.1W 0805 1% 220K
1	R58	Resistor, film, SMD 0805, 330 kΩ	Panasonic/ERJ-6GEYJ334V
1	R66	Resistor, PREC, thick film chip, R1206, 1.5 kΩ	Panasonic/ERJ-8ENF1501V
2	R76, R80	Resistor, film, SMD 0805, 680 Ω	Multicomp/MC 0.1W 0805 1% 680R
2	R78, R79	Resistor, film, SMD 1206, 27 Ω	Phycomp (Yageo)/9C12063A27R0FKHFT
3	S1 to S3	SW SM mechanical key switch	Omron/B3S1000
4	U3, U4, U6, U7	IC quad channel digital isolator	Analog Devices/ADuM3401CRWZ
1	U8	IC ARM7, MCU, flash, 512K 100 LQFP	NXP/LPC2368FBD100
1	U9	IC 300mA low dropout CMOS linear regulator	Analog Devices/ADP1713AUJZ-3.3-R7
1	Y1	IC crystal, 16.384 MHz	Valpey Fisher Corporation/VM6-1D11C12-TR-16.384 MHz
1	Y2	IC crystal quartz, 12.0 MHz	ECS/ECS-120-20-4X

NOTES

I²C refers to a communications protocol originally developed by Philips Semiconductors (now NXP Semiconductors).

ESD Caution

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.
