POWER_GOOD, DC_OK, INHIBIT SIGNALS AND CURRENT SHARING – J2

1. Power_Good: - Output Signal – J2 Pin 6

During normal operation is Logic High, goes HIGH 100mS–250mS after main output is in regulation, and goes LOW with 7mS warning time before loss of main output due to loss of AC input.

Note: Power_Good signal is a combination of AC OK (Internal) and DC_OK such that failure of either one will cause the Power_Good signal to go low

Logic High: >4.5V sourcing 16mA

Logic Low: <0.5V sinking 16mA

Figure 1

2. DC_OK: Output signal – J2 Pin 10

During normal operation, this signal is logic High. It will go logic Low for output less than 90% of its nominal rated voltage.

Logic High: >4.5V sourcing 16mA

Logic Low: <0.5V sinking 16mA

Figure 2

3. Enable: Input signal – J2 Pin 9

Logic High or Open = ON

Low/ground = OFF

Logic High >3.4V

Logic Low <1.2V

Internal pull up resistor: 43KW to 5V

4. PS_Off: Input signal – J2 Pin 8

Logic Low or Open = ON

Logic High = OFF

Logic High >3.4V

Logic Low <1.2V

Internal pull down resistor: 43KW to V-

5. Remote Sense Output Signal – J2 Pin 1 (+Sense), J2 Pin 2 (-Sense)

Less than 250mV voltage drop compensation due to cable loss on each side of main output. See Figure 3 for wiring connection

6. Stand-By Output – J2 Pin5 (+), J2 Pin 4 (-)

The standby output is always available when AC input is present. It is rated for 5V/0.2A

5VSB Always present when AC is On
