

Features

- Supply Voltage +4 to +36V
- Supply Current < 1.2mA
- Loss Resistance 5 to 50kΩ
- Oscillator Frequency < 1MHz
- Output Transistors $I = 20\text{mA}$, $V_{CE(sat)} \leq 1.1\text{V}$

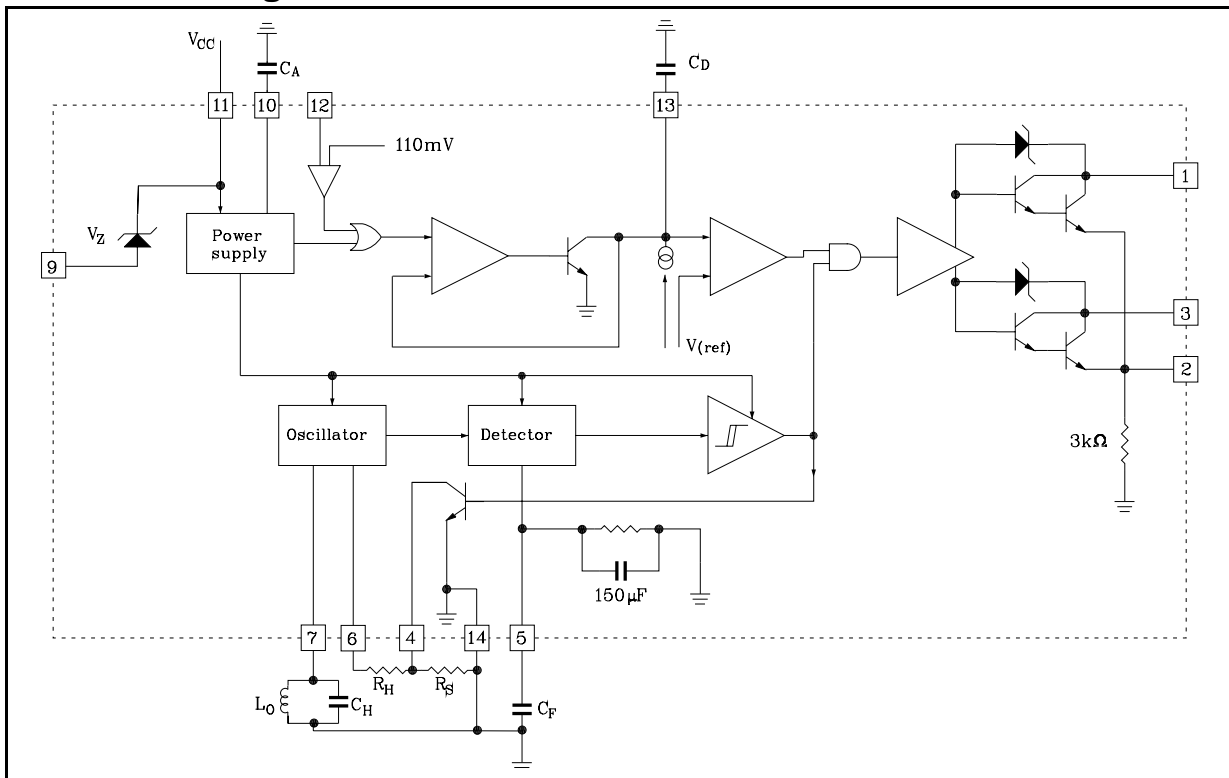

Description

The TDE0160 is designed to detect metal bodies by the effect of Eddy currents on the HF losses of a coil. It has two complementary open collector outputs with peak limiting. Hysteresis is adjustable, and an electronic switching circuit is incorporated for disabling both outputs.

An internal zener diode maintains the supply voltage to the circuit in “dipole” operation.

3 Operating Mode

If I_C exceeds $I_{CO} = V_{(ref)} / R_d$ the switch cuts off the output transistor and tests the value of current I_C , with time constant $0.5C_d$. On power up the internal start system cuts off the output transistors until V_{CC} reaches a value permitting normal operation of the circuit.
